In three years the operation of the Amendment Act had reduced the expenditure one-third viz. to £4,044,741. In 1848 the commissioners were exchanged for a public board, which became one of the government departments, with a president, in whom was vested the power of the commissioners, and who held office as one of the ministers of the crown. The Poor-law Board was abolished, and its powers transferred (with various other powers) to a new body, the Local Government Board (q.v.), which accordingly became the central authority for England and Wales in regard to poor-law administration. This board has power to withdraw the powers of outdoor relief, which continues to be in England the most important item. With the aged, the sick, and orphans the guardians deal at their discretion; but stringent rules for the relief of the able-bodied are in operation under the board, whose orders are given in terms of law. Guardians are prohibited from giving relief to the able-bodied out of the house, unless under a supplemental order in emergency. For other places the general rule forbids relief to be given in aid of wages, and requires work to be supplied. Exceptions are made in cases of necessity, and of the unions when necessity arises. The expenditure is strictly guarded and examined by public auditors. A district medical officer, of whom one or more are appointed for each union, attends to all cases of sickness among the poor.

The fundamental rule adopted as to the relief of the poor was that each parish in England and Wales is bound to maintain its own poor. Overseers are required to be appointed in each parish every year; and these (till 1894, along with the churchwardens, till then ex officio overseers) have to provide the relief, and requisition the funds for it, from the rate, which the churchwardens and overseers may levy on all the occupiers of land in the parish, after such rate has been confirmed by the justices. The rate specifies a certain sum in the pound which is to be levied, and the annual value of the various lands is then specified. The rate is thus a local tax on the occupier of the land, and not on the owner, unless he himself is also occupier. Owing to the mischiefs arising from the officials of each parish distributing the funds at their discretion, without uniformity of plan, authority was given to the Poor-law Board of England and Wales in 1834, and a central controlling power was created in 1834 in the shape of the Poor-law Board, now the Local Government Board. When a union is formed the control of the expenditure is chiefly vested in the guardians of that union, who are elected by each parish, and who supervise the management of the union workhouse. They order the overseers of each parish to raise their due proportion of funds by a contribution order issued to such overseers, who are therewith bound to levy the amount by including it in the next poor-rate. The guardians are bound to contract for the provision of clothing, fuel, &c. supplied to the workhouse, by means of sealed tenders, unless the quantity is less than a stated amount. The guardians profess only to relieve destitution already existing, and not to enable persons to keep off impending destitution. Hence they only supply the bare necessities of life. They cannot, for example, advance or lend money to set up a poor person in trade.

Minute regulations are contained in the consolidated poor-law orders of the Board as to the classification of paupers in the workhouse, mode of carrying out the orders of the Board, and the various cases in which the poor are to be maintained. It is provided that every able-bodied person requiring relief from any parish shall be relieved wholly in the workhouse, together with his wife and family, if any, and if not otherwise employed. But the relief may be given out of doors in cases of sudden and urgent necessity, of sickness, accident, and a few other cases. In general relief is confined to persons actually residing in some place within the union, except in case of casual destitution, or sickness and accident. Whenever outdoor relief is given to an able-bodied person half of it is to be in the form of work, which is to be performed only weekly where the pauper is not required to be received into the workhouse. No relief is to be given to able-bodied persons while they are employed for wages or hire by any person; and every able-bodied male person, if relieved out of the workhouse, is to be required to work for a certain proportion of the time by the guardians, and kept so employed while he continues to receive such relief. Wherever a person applies for parochial relief, if he or she has a father or grandfather, mother or grandmother, or child, who is able to maintain such pauper, the parish officers can obtain from him the due proportion of the maintenance relative to contribute a sum towards such maintenance. In some cases the guardians or overseers may employ the poor in public works; but this is
seldom done except on occasions like the Lancashire distress. The law as to the settlement of the poor is somewhat intricate, and gives rise to much litigation. There are various grounds on which this settlement is acquired. Thus, every person has, **prima facta**, a settlement in the parish where he was born, until some other is proved; and there are some cases in which a birth is intended to be registered. This birth-settlement is resorted to. By marriage a woman immediately acquires the settlement of her husband, if he has one, whether the husband be an Englishman or a foreigner. If the husband has no sett of settlement he is to be placed on his maiden settlement. If any person shall be bound by indenture, and reside forty days under such apprenticeship, or has resided three years in a parish, or shall rent a tenement in a parish, and actually occupy the same, and be rated to the poor for one whole year, the rent being not less than £10, and paid by the person so actually occupying the tenement, or shall acquire an estate in land, however small in value, and reside forty days in the parish, or shall buy an estate, and the consideration amount to £50 at least, he shall by these means acquire a settlement. Unless a pauper has acquired a settlement in the parish or union where he receives relief, he is liable to be removed compulsorily to the parish where he last acquired a settlement. Paupers who have resided for one whole year in the parish or union in which they became destitute cannot, however, be removed. The general expense of maintaining the poor is paid out of the common fund, and not by each parish in the union. When a pauper is sought to be removed it is necessary to take him before the justices for examination, and, on proper evidence of his settlement, the justices will make the order of removal, which is an authority to the overseers to take or send the pauper to the overseers of the parish of settlement. If, however, the pauper is too ill at the time to admit of removal without danger, the justices may suspend the order of removal till he is recovered. Whenever a pauper is to be removed the removing union is bound to give notice to the union of settlement; and it is on these occasions that so many obstinate and costly litigations take place as to which is the union of settlement. The union also may appeal to the court of quarter sessions against the removal order; and the quarter sessions may state a case for the opinion of the Court of Queen’s Bench, if any nice point of law should really happen. Evils of litigation were greatly diminished by the Union Chargeability Act of 1835. The Local Government Act of 1894 left the administration of the poor-laws of England with the guardians and overseers. But churchwardens ceased to be ex officio overseers; the parochial electors appoint the guardians, and the parish council appoints the overseers, additional ones being appointed in place of the churchwardens.

Scotland and Ireland have been legislated for separately. Their poor-laws are similar to the English in principle and practice, but are administered by a central board, which supervises the local bodies charged with relief, and in both the rate is levied on the annual value of real property. In Scotland the usual early legislation was passed against stately begging. The assessment by the owners in each landward (i.e. non-urban) parish was set up in 1579 and 1603, and the general policy of the poor-laws was stated in proclamations by the Privy-council in the end of the 17th century. Until the 19th century, however, the poor in Scotland had no parliamentary representation, the voluntary collections at the parish church, administered by the heritors and kirk-session. In spite of the opposition of Dr Chalmers, a new system was instituted in 1845. Relief was administered by a parochial board, appointed by the ratepayers, the burgh magistrates, and the kirk-session; and the board appointed ‘inspectors of the poor’ as relieving-officers. The Scots law differs from the English and Irish in allowing no relief to able-bodied adults, although the able-bodied are not able to work. Outdoor relief is the rule. In 1845 a central board was established, called the Board of Supervision, controlling the parochial board of each parish like the Local Government Board in England, and the parochial poor-laws, although the parochial boards might combine to build workhouses, there are no unions, properly so called, in Scotland. A settlement can be acquired in Scotland by residence of five years. Children follow the settlement of their parents, and wives that of their husbands; and if no other settlement be proved, then the settlement of birth is liable. In Scotland the poor-rate, except in a few cases where the local usage established in 1845 is followed, is universally imposed equally upon owners and occupiers according to the annual value of the houses, works, farms, mines, &c., for which they are paid, and giving appropriate deductions from annual value. The tendency of this system is to approach an assessment imposed upon probable income, the older assessment in Scotland having frequently been laid on means and sub- stance. The assessment, originally laid on the occupiers, was successively transferred to the Local Government Board for Scotland, a semi-independent body being thus superseded by a state department (in Edinburgh, as before). The Secretary for Scotland is president of the board, which through him is responsible to parliament.

In Ireland the Poor-law Act was passed for the first time in 1838, and numerous amending statutes have followed, the code of laws being substantially founded on the English acts. Each union has a workhouse managed by a Board of Guardians elected by the ratepayers. Every destitute person has an absolute right to relief, which is administered almost entirely in the workhouse. The Local Government Act of 1898 made no essential changes. There are special acts of parliament regulating the system of life assurance under which the poor are relieved between England, Scotland, and Ireland respectively.

In recent times a new policy has been devised, and in the German empire carried into practical effect, of providing against the evils which accompany the poor-law by which is meant the law policy, generally known as that of compulsory insurance. The German law of 13th June 1883 on sickness insurance was followed by that of 6th July 1884 on accident insurance, and that of 22d June 1889 on insurance against lifelong dependence and disability. Compulsory contributions are collected, to which the workman, the employer, and the state are all parties. The disability pension is given after
five years' payment, the old age pension after thirty years' payment and after the age of sixty, Where the lowest class of salary. Adequate provisions of the Poor-Laws outdoor and 6d. 1887 while 1891 Ist cost, receive of the 1880 a There Arohbold, the Smith 1882 Sir well-considered 1
1899) public-houses, all 5id. or to ing was Vagrants). were were ing the tenancy of the charge to the state is expected to exceed £4,000,000 sterling. A comparison of the statistics of poor-law administration for England and Wales in 1872 and 1889 is interesting and encouraging. In 1872, the population (1871) of England and Wales being 22,712,266, there were 977,200 paupers, of whom 150,350 were able-bodied adults. The total cost of poor relief was £8,007,403, while the rateable value of property assessed was £107,358,342. In 1889, the population (1891) being 29,001,018, the corresponding figures being 1,206,102 paupers, of whom 394,775 were able-bodied adults; cost, £8,232,472; property assessed, £139,036,307. The burden had diminished from 1s. 5jd. to 1s. 1½d. per £1 (see Vagrants).

In Scotland in 1890, the population (1881) being 4,093,163, the paupers were 62,324; the expenditure, including buildings, was £874,359, contributed to the extent of 70½ by assessment, and the grants in aid 17½, being at the rate of 4s. 4d. per head of population, and 1s. 6d. lower than in England. The cost of the lunatic poor rapidly increases. In Ireland, the population in 1891 being 4,706,102, the average daily number, in 1890, of paupers in the workhouses was 43,536, and on outdoor relief 62,286, together 105,822. In 1889 the total expenditure on poor relief was £853,912. It would be misleading to draw inferences from these figures with respect to the condition of the respective countries, as the practical details of poor relief vary greatly.

In America the system is on the whole similar to the British. Every man is entitled by law to relief from the town of his settlement, the rate being assessed on whole towns, and not on parishes. The poor rate bears upon all paupers who are removable from one state to another. Thus, in Massachusetts the unit of poor-law administration is the town or city, comprising in each case the surrounding rural district; while in New York the unit, generally speaking, is the county. These areas bear the burden of the settled poor: the unsettled poor (including Indians) are a charge upon the state. In New York one year's residence is sufficient to constitute a settlement. The policy in Massachusetts has been to encourage outdoor relief as being more economical, and for this reason to set aside a certain number of almshouses. A Massachusetts becoming a pauper loses his state rights. The acts concerning Workhouses and Paupers in the Revised Code of Massachusetts may be taken to represent generally the state of the law throughout the Union. The former provides that any town may erect a paupers' house and a certain number of almshouses, and support of all poor and indigent persons that are maintained by, or receive alms from, the town; all persons who, being able to work, and not having means to maintain themselves, refuse or neglect to work; all persons who live a dissolute and extravagant life; all persons who have committed and are charged with any felony or unlawful business; and all such persons as spend their time and property in public-houses, to the neglect of their proper business, or by otherwise mis-spending what they earn, to the impoverishment of themselves and their families, are likely to become chargeable paupers. The officers of the poor-law are: the Board of Supervisors, in each county, to take orders and to superintend the administration of the poor-law; the overseers of the poor; and the officers of the local police; and the county court, in each county, to examine and to take orders for the discharge of the poor-law officers. There are provisions for enforcing the claims of kindred and for the immediate relief of strangers. The administration is in the hands of overseers, but the counties elect superintendents, holding office for three years, who are again responsible to a Board of Supervisors. The New York State Board of Charities contracts with the counties for the housing in almshouses of certain classes of the state poor. The State Boards have large general powers in respect of superintending the administration of the poor-law, and correctional system of the commonwealth, and report annually to the legislature on such questions. These boards are mainly nominated by the governor. Their functions and the results achieved are described in Mr Sanborn's Report to the Massachusetts Centennial Commission, 1st February 1876, and in the Report by Mr Henley to the Local Government Board in June 1877 (Parliamentary Papers, vol. xxvii.), on the Poor-laws of certain of the United States, and on the combination there of private charity with official relief. The Massachusetts system is in a specially strong position in Bridgewater and Tewkesbury respectively; the most important establishment in New York state is on Blackwell's Island. Generally the American system is marked by a high degree of classification, variety of work, special educational methods, and liberal treatment in the matter of diet. In the city of Boston, under special statutes, the authority of overseers is largely superseded by a 'Board of Directors for Public Institutions.' The former practice of levying a small poll-tax on poor immigrants was decided by the case of Henderson v. Wickham (4th January 1842). The Board is composed of six members, three elected by the city council, and three appointed by the mayor. With reference to the efforts made by voluntary associations to assist and develop the working of the poor-law in America, Mr Henley reports that this cannot properly be done except under a well-considered regulation having the force of law, and a paid staff of officers acting under orders of representative and responsible administrators, controlled by independent auditors.

There is no poor-law in the Australian colonies, but benevolent asylums for the infirm and destitute have become general, and hospitals are numerous in all the rising towns.

Poor's-roll, in the practice of the law of Scotland, means the list of poor persons who are litigants, but unable to pay the expenses of litigation, and therefore are allowed to sue in forma pauperis. This privilege is only granted on production of a certificate from the parish and elders, setting forth his circumstances to his own knowledge and his general poverty. Notice is given of this to the adverse party, who is allowed time to inquire and oppose the application. Where the applicant is not in Scotland he may make a declaration of poverty before (or in Scotland) e.g. in Ireland. When the court is satisfied of the poverty the next thing is for the court to remit the matter to the reporters appointed by the Faculty of Advocates, who report whether there is a probablis causa—i.e. a plausible cause of action. If this report is made it is considered conclusive, and the party is put on the poor's-roll. This warrant remains in force for two years, and during that time the pauper is exempt from all fees of court, and has the gratuitous services of counsel and agents, whose names appear on a list made by the Faculty and other learned bodies. This provision for enabling paupers to carry on litigation is unknown in England or Ireland; for though a party may also be allowed there to sue in forma pauperis, no provision is made by the court for giving the pauper gratuitous counsel and attorney. There is also a list of poor's counsel in the High Court of Justiciary. By an old custom a panel charged with murder may claim the gratuitous services of the Dean of Facenby. See In Forma Pauperis.

Popayan, capital of the department of Caucu in Colombia, stands in a fertile plain, 5700 feet above sea-level, near the river Cauca. It is a bishop's see, although its cathedral is now in ruins; and it has a university and normal school, and manufactures woollens. Founded in 1537, it rose to considerable importance; but the civil wars and an earthquake in 1827 have done much to reduce it. It is still of some consequence for the trade with Peru. Pop. 9000.

Pope, a fish of the Perch family. See Ruffe.

Pope (Gr. pappos, Lat. papas, 'father;' at first used of all bishops, from the 5th century gradually appropriated in the West to the Bishop of Rome, though still used of priests of the Greek Church), the head of the See of Rome and Patriarch of the Roman Catholic Church. In this article an historic sketch will be given of the papacy as an institution. While the empire remained pagan the history of the bishops of Rome is obscure. Tradition confirmed by the faith of the church represents St Peter as the first Bishop of Rome. His immediate successors must have been recognised by Christians as the heads of Christ's church in the imperial city. Rome, the mistress of the world, was regarded by all men with reverence; all men came thither. So among Christians his bishop held a position of special dignity, and his judgment in ecclesiastical controversies was regarded as weighty. The heresy of Novatian, irregularly ordained Bishop of Rome during the lifetime of Cornelius (251), illustrated the importance of ecclesiastical unity, and so in the end tended to exalt the Bishop of Rome as the vicar of the church on earth.

Under Constantine the empire became Christian, and Rome ceased to be the sole imperial city. The first of these changes vastly increased the dignity of his bishop; the second separated Latin from Eastern, and the heresies of the speculative East found no acceptance in the West; the Bishop of Rome became the champion of orthodoxy, and was recognised by the Council of Sardica (347) as having appellate jurisdiction. Before the end of the 4th century Siricius, in publishing his decreal on clerical celibacy, assumed that the law of the Roman Church was binding everywhere. A great increase in power may be dated from the reign of Innocent I. (402-417), who claimed, as St Peter, superiority over western Christendom. The namesakes of the latter, after the sacking of Rome by the Visigoths, and the reverence which they paid to all things Christian, combined to make Innocent the most powerful person in the Christian city which rose upon the ashes of the imperial Rome. Leonde (440-451) maintained the claim of his see to the patriarchate of the West, while in Rome and Italy his fearlessness and prudence during the invasions of the Huns and Vandals gave him commanding influence. In 476 the empire of the west came to an end; the sole emperor of the Romans reigned at Constantinople. As long as he left Italy alone the papal power was the stronger for his absence. Amid the political disintegration of the West the church remained a stable bond of union; its centre was Rome, and the papal see the head of the Western Church; it was more and more regarded as the leader and defender of the people. Though Theodoric the Ostrogoth, while master of Italy, abstained from interference with the bishops of Rome until shortly before his death, some trouble arose from disputed elections. In 590 the first day of the election the college of cardinals met for the people of the city, but as the interference of the laity led to violence, Symmachus decreed (498) that thenceforward the election should be decided by the votes of the Roman clergy. The reconquest of Italy by the generals of Justinian impaired the papal power, for he treated the pope like a rebellious servant. As the imperial power waned in Italy before the invasion of the Lombards, the pope again became pre-eminent. Neglected by her emperor, Rome found a protector in Gregory the Great (590-604), who was forced by the sufferings of the people to deal with the Lombards as a temporal prince. Yet his work was chiefly spiritual. Under him the right to the patriarchate of the West was firmly established; his holiness, his writings, and his reforms were universally admired; he re-established the ecclesiastical supremacy of the bishops of other lands, and he resented the indignity put upon his see by the assumption of the title 'Universal Bishop' by the Patriarch of Constantinople. Under him the Arian invaders of Italy, the Lombards, were converted; so too, were the Arians of Visigoth Spain; while the heathen English first received the gospel from missionaries whom he sent out. Gregory completed the work of Innocent and Leo, and was the greatest of the three founders of the papacy of the middle ages.

During the 7th century the popes were much troubled by the eastern emperors, who were still lords of Rome and some parts of Italy. The emperors caused elections to the papacy to be submitted to themselves for confirmation, tried to prevent the popes from exercising the rights of the see of St Peter, and treated them as mere officers of their state. Martin I. (649-654), a strenuous opponent of the Monothelite heresy, was seized, carried off to Constantinople, and, after suffering ill Usage, died in exile. Even when the emperors again became orthodox they still humiliated the popes. Meanwhile the papal power was growing in western lands; the English turned from Columban usages, and professed obedience to Rome (684); the Burgundians and Friselanders received the gospel; and early in the 8th century Boniface went on a large part of Germany to the faith, acting on a commission from Gregory II. (715-731). In Gregory's time the Emperor Leo III. forbade the worship and even the use of images throughout his empire,
whence he and his successors who adopted the same policy are called Iconoclasts (image-breakers). Gregory refused to obey his decree, and was upheld by the papal court. In 807, the Emperor Louis the German, a certain imperial governor in Italy, called the exarch, sought to compel the pope to obey his master, and the Italians rose in the pope’s defence. The Lombards took advantage of the confusion to conquer the exarchate. They threatened the lands of the church; no help was to be had from the emperor: Italy was virtually severed from the empire. In his distress, Gregory III. (731–741) appealed for help to the Catholic Frankish forces. Twice Pepin brought an army of Franks to the pope’s relief, and routed the Lombards; he won back from them all that had belonged to the exarchate in Italy, and bestowed it on the Roman see (754). This was the beginning of the temporal power of the pope. In return Pepin accepted from the pope the title of Patrician of the Romans, an acknowledgment of his rights in Rome, and of his duty as the defender of the church. He had already received the papal sanction for the deposition of the Frankish king and his own coronation; the pope’s action in this matter formed a precedent not forgotten by his successors. Pepin’s son, Charles (Charlemagne), again routed the Lombards, and renewed the pope’s dominion; a solemn visit was declared Leo III. (795–816) guiltless of certain crimes with which he was charged, and on Christmas Day, 800, Leo crowned him emperor. It was contrary to the feelings of the age that the church should lack an imperial protector; the breach with the eastern empire was complete, and the imperial throne at Constantinople was held to be occupied unlawfully. While Leo had allowed his cause to be judged by a temporal prince, and had accepted him as master of Rome and emperor, he had assumed as God’s clear the right to bestow the imperial crown, which carried with it the lordship of the world.

During the struggles that preceded the break-up of the Frankish empire the pope generally favoured the princes of the West (or Gaulish) Franks, rather than of the East (or German) Franks. The rise of the Franks thenceforward placed the hands of the great churchmen of the new states. The pontificate of Nicholas I. (858–867) was marked by the successful assertion of the authority of Rome in correcting the vices of princes, and compelling the submission of the most powerful prelates of the church. The Armagnac, a certain German bishop who upheld their king in his evil ways, and even Hincmar of Rheims. His chief weapon against the bishops was a series of early decrees, now known to have been forgeries not emanating from Rome. The lofty policy of Nicholas was pursued, though with less success, by Hadrian II. (867–872). Meanwhile a dispute begun in the time of Nicholas was leading the Greek Church towards schism. During the papacy of John VIII. (872–882) the Saracens established themselves in Southern Italy and threatened Rome, and the courageous pope sought help on all sides against them and his Christian enemies. The anarchy in Italy which followed the extinction of the Carolingian empire had the worst effects on the papacy. Things were darkest in the first half of the 10th century. Competitors for power treated the pope as a puppet, and captains of the church were decided either by the nobles of Rome, or the mob, or any foreign power which chanced to be master of the city. No reverence was paid to the papal office, and several of those raised to it were murdered openly by enemies. John XII. sent for help to Otto the Great, king of Germany, and, by crowning him emperor in 962, revived the empire; he acknowledged Otto as his sovereign, and the Romans swore to elect no pope without the emperor’s consent. Though Otto, his son, and his grandson did something towards restoring the hereditary papacy, however, a terrible attempt to regenerate it failed; and, after the death of Otto III., it was again degraded by falling under the control of the counts of Tusculum. The emperor Henry III. regenerated the papacy by releasing it from the control of the Roman nobles, and conferring it on German churchmen of high character. One of these, Leo IX. (1049–55), commanded the respect of Christendom by his revival of ecclesiastical discipline. He was taken prisoner when attempting to check the Norman invaders of Italy, but the Normans reverenced their captive and accorded him the welcome that was due to the pope as the feudal lord of their conquests, Sicily and Southern Italy. Under the guidance of Hildebrand (see Gregory VII.), the papacy advanced rapidly in power and empire. By a decree of Nicholas II. (1059–61) in 1059 the right of election was vested in the cardinals. After a severe struggle clerical celibacy was enforced, and the clergy thus separated from worldly ties became devoted to the interests of their order and its earthly head. Simony was strictly repressed. A further advance was made when Gregory VII. (1072–84). These and other victories gave to their beneficiaries from lay hands. This touched the sovereignty of lay princes. He was opposed by the Emperor Henry IV. (q.v.). The principle at stake was the church’s independence of the lay power, its dependence on its own visible head, and its consequent salvation from feudal bonds and abuses. Gregory asserted the highest claims, and deposed the emperor, who made a humiliating submission at Canossa in 1077. Pope and emperor each found support, the pope in the discontent of the Germans and in the Normans. War broke out, an antipope and rivals to the emperor were set up. The struggle lasted beyond the lives of Gregory and Henry IV., and was decided in 1122 by the Concordat of Worms, which, though a compromise, was a substantial victory for the papacy. During the struggle the Crusades were brought to Rome, and in 1096 they made him the head of Christendom in arms and the director of its forces. Though disturbed for a few years by a schism, the result of Roman faction, the reign of Innocent II. (1130–43) was a time of greatness. The religious orders had from the first been brought into the service of the papacy, and, through their activities, they made the pope the chief adviser of the popes, and, each order as it was founded laid its new-born seal at the disposal of Rome. Innocent gained much from the support of St Bernard, backed by all the strength of the Cluniac order. Under Hadrian IV. (1154–59), a native of St Albans, named Nicholas Breakspeare, the only Englishman who has been raised to the papal chair, the papacy entered on a struggle with the Emperor Frederick I., who was determined fully to enforce his imperial rights. In theory pope and emperor supplied each the complement of the other’s power, the one being God’s vicegerent in spiritual, the other in worldly things; but the limits dividing their spheres of action were undefined, and when both were strong they were almost forced into hostility. Among the definite causes of dispute was the sovereignty of the pope over certain parts of Italy, which had been assigned by the papacy by the Countess Matilda of Tuscany (died 1115). The popes were upheld by a league of the Lombard cities, which carried on a long war with the emperor; he was defeated, and in 1177 submitted to Alexander III.

The papal authority reached its greatest height under Innocent III. (1198–1216), who ruled as the head of a vast spiritual empire, founded on the
reverence of mankind for righteousness. He was master in Italy. His strife with two emperors ended in the success of his ward, Frederick II., inheritor of the Sicilian throne, whom he crowned emperor. By excommunication he forced the king of England to marry a woman no deeper than John of England, and compelled him to become his vassal. The kings of many nations submitted to his rebukes. The Latin conquest of Constantinople brought the East for a while under the papal obedience, and a crusading army began to extirpate the heresy of the Holy See; the church was retaining all the foundation of the orders of St Dominic and St Francis, which gave the pope well-organised and generally devoted forces in every land. Innocent was the first pope that exercised full dominion over the States of the Church. Their position as temporal sovereigns brought his successors into collision with Frederick II., who, already king of Sicily and Naples, wished to gain Central Italy. Had he done so he would have made the papacy dependent on himself. Gregory IX. (1227-41) and Innocent IV. (1243-54) sought to make it, through his spiritual and temporal, at its disposal. The Italian cities of the Guelfie or papal party were their strongest allies. Innocent declared the emperor deposed, and found allies against him in Germany. The papal resources were strained; money was scarce. Power was in the hands of Frederick, specially from England, and the papacy lost in repulse by its demands. The struggle was continued against Frederick's house until it was extinguished. All danger of subjection to the empire was past; but the papacy owed its final success to Charles of Anjou, who was invested with the kingdom of Sicily and Naples. This gave France an interest in Italy, and led to the subjection of the papacy to the French king. The imperial power having fallen, Boniface VIII. (1294-1303) sought to take the emperor's place as head of Europe. His aims were ambitious and his temper violent. National monarchies were being built up in England and France by strong kings. The claims of Boniface were subversive of their domestic policy; they refused to admit them, and he quarrelled with both. The Italian partisans of Philip IV. of France seized him; he was brutally treated, and died soon afterwards.

Philip procured the election of a Frenchman, Clement V. (1305-16), who resided at Avignon in Provence, afterwards sold to the papacy. There the Avignon was luxuriant and venal; it was a period called the 'Babylonian Captivity,' during which the papacy was under the influence of their powerful neighbour of France. A long struggle with the Emperor Louis IV., in which the popes were successful, injured the reputation of the papacy. During its course men began to criticise the character and claims of the papacy. It was attacked on ecclesiastical grounds by the 'Spiritual Franciscans,' and by scholars like Ockham, and on political by the imperial legates. The cost of the Avignon was luxuriant and venal. Little revenue came from the States of the Church, which fell into disorder during the pope's absence, and large sums were raised from national churches and by corrupt means. Fearing to lose all authority in Italy, Gregory XI. returned to Rome in 1378, but Louis IV. and the French cardinals, in order to lead the schism the cardinals revived the long disused authority of a general council. The Council of Pisa (1409) failed of its object. The reform, as well as the reunion of the church was largely desired. In England Wydill urged apostolic poverty as the only cure for abuses. His teaching was of little practical importance, save that it helped forward the revolt of Bohemia, where the Slavs regarded the Latin church as a foreign power. Many orthodox churchmen desired to see the abuses of the papal court reformed and the churches of the several countries preserved from undue papal interference. By the Council of Constance the schism was closed, and Martin V. (1417-31) was elected pope. He was a man of principle, and an ardent reformer. Martin's wise administration raised the papacy from its low estate; he regained its possessions, and made its power widely felt. The Bohemian war made another council inevitable; it met at Basel in 1432, it attacked Eugenius IV. (1431-47), raised an antipope, and ended in contempt. Meanwhile the Greeks, hoping for help against the Turks, submitted to the holy see. In another respect the papacy was specially affected by the troubles of the Greeks. It readily adopted the learning and influence brought by the Greek emigration to Italy. The aims of Nicholas V. (1447-55) conceived a new ideal. The 15th century was an age of splendour; its magnificence was conspicuous in the lives not merely of princes, but even of nobles, merchants, and bankers. As the papacy outstripped all earthly powers, it became the scene of the arts. It was Rome its seat to impose on the imagination of all the world by an exterior grandeur which should outshine that of the city of any earthly potentate. But his was no vulgar ideal of mere magnificence; Rome to him was to be the protean point of culture in the Christian world; and all this was to typify and render sensible the supremacy of religion.

Under Pius II. (1458-66) the pope again appeared as the natural head of the forces of Christendom. He was the type of the new spirit of the time. The popes of Pius's age had been so loudly and so often praised that it was difficult to inherit the loftiness of his spirit. Whilst pursuing the idea of surrounding the papal dignity with pre-eminent splendour, some, like Paul II. (1464-71), betrayed a sympathy for the pagan renaissance which is unmitigable, and which cannot fail to be destructive of the Papal Church as the spiritual head of the church. Other popes, like Alexander VI. (1492-1503) or Julius II. (1503-13), were bent on founding in the Italian states princes either for their relatives or for the papal states. This is specially true of Alexander (Borgia), whose earlier life had been immoral, and who as pope caused scandal by his undisguised love of worldly pleasures; whilst his son Cesar, an able, unscrupulous man, made matters worse by his crimes.

Meantime the idea of reform had not slept—witness the activity of such a man as Cardinal Nicolas of Cusa—but efforts like his were inspired by individual minds of a specially lofty turn, and at most had the countenance of supreme authority; however widespread, they were local and were not that general, reformative in head and members, which had been so loudly and so earnestly called for. The inevitable day of reckoning came, but in a guise which none expected. In place of reform the Protestant Reformation effected a ruthless breach with the past, and instead of the enforcement of the truth the pope repudiated the pietats of the church was largely desired. In England Wydill urged apostolic poverty as the only cure for abuses. His teaching was of little practical importance, save that it helped forward the revolt of Bohemia, where the Slavs regarded the Latin church as a foreign power. It was Rome its seat to impose on the imagination of all the world by an exterior grandeur which should outshine that of the city of any earthly potentate. But his was no vulgar ideal of mere magnificence; Rome to him was to be the protean point of culture in the Christian world; and all this was to typify and render sensible the supremacy of religion.

Under Pius II. (1458-66) the pope again appeared as the natural head of the forces of Christendom. He was the type of the new spirit of the time. The popes of Pius's age had been so loudly and so often praised that it was difficult to inherit the loftiness of his spirit. Whilst pursuing the idea of surrounding the papal dignity with pre-eminent splendour, some, like Paul II. (1464-71), betrayed a sympathy for the pagan renaissance which is unmitigable, and which cannot fail to be destructive of the Papal Church as the spiritual head of the church. Other popes, like Alexander VI. (1492-1503) or Julius II. (1503-13), were bent on founding in the Italian states princes either for their relatives or for the papal states. This is specially true of Alexander (Borgia), whose earlier life had been immoral, and who as pope caused scandal by his undisguised love of worldly pleasures; whilst his son Cesar, an able, unscrupulous man, made matters worse by his crimes.

Meantime the idea of reform had not slept—witness the activity of such a man as Cardinal Nicolas of Cusa—but efforts like his were inspired by individual minds of a specially lofty turn, and at most had the countenance of supreme authority; however widespread, they were local and were not that general, reformative in head and members, which had been so loudly and so earnestly called for. The inevitable day of reckoning came, but in a guise which none expected. In place of reform the Protestant Reformation effected a ruthless breach with the past, and instead of the enforcement of the truth the pope repudiated the pietats of
the need of the time. Rome itself furnished a
lamentable illustration of the ruin that had come
upon the church. Clement VII. (1523-34), though
he had his own political aims, was as a man not
unworthy of his office, and by character the least
able of the pontiffs who witnessed Rome ruthlessly sacked (1527), and
that by the troops of Charles V., who during the
first half of the 16th century was the mainstay of
the Catholic cause, and by his dignity as then
emperor-elect the recognised protector of the Roman
Church. The impression made by this event even on
religious minds is well expressed in the measured
but weighty words of Cardinal Sadoletto. 'If
these,' he writes, 'had done their duty on whom
the obligation chiefly rested (I speak not of
the pontiff whose virtues, mildness, and uprightness
are known not as great merely but as admirable),
the priesthood would still be venerated as of old,
and not now exposed to injury and contempt. I
say what I feel, and God and man are my witnesses,
that this best of pontiffs desired to cure these
corrupt morals; but the thing needed the knife,
not the hand that was gentle and kindly; spirit shrank
from strong measures.'

From this point the history of the papacy to the
close of the 18th century falls naturally into three
divisions. From 1530 to the early years of the
17th century there takes place a reconstitution of
the basis of Catholic reform; this follows a century of normal activity on the new
basis thus formed; thirdly, a century of decline
in influence, the term of which is marked by the
conclave in Venice which resulted in the election
of Pope Pius VII.

(1) No time was lost in setting about the work
which now all recognised as the imperative need.
The papacy was not prominent in the work of
reform; but the concomitance given by Rome to men
like Contarini, Pole, and Giberti is sufficient
evidence that the popes themselves did not intend to be
behindhand. The pontificate of Paul III. (1534-
50) witnessed two events of considerable importance
to the future of the church—the institution of the
Jesuits, and the commencement of the Council of
Trent. In 1534 Ignatius of Loyola pronounced
his vows in the presence of the pope, and thus laid
the foundations of that society devoted
entirely to the service of the holy see, with which its
fortunes have subsequently been intimately
associated. The ideal conceived by Ignatius was that
of an order governed by a general whom all should
be bound to obey under vow, who should be
perpetual, possessed of absolute authority, subject
entirely to the pope, but not liable to be restrained
by any chapters of the order.' Paul III., on September
27, 1540, by the bull Regionum militantis, gave
the papal approval to the 'form of life' designed by
the founder. The Council of Trent, whatever be
the portion of it of dogmatic definitions, is essentially
a council of disciplinary reform; but in this place
it requires notice as being a council of which,
though held at a distance from Rome, the central
and effective action really vested in the pope. After
long negotiations the council convoked by Paul III.
met Trent in December 1545. As early as 1542
the papal legates had reached that city; but the
war between France and Germany which then broke
out made the further delay inevitable. It is worth
noting, as showing the influence already pos-
sessed by the newly-founded Society of Jesus, that
two of the bishops sent by the court as papal
theologians. On April 28, 1552, the sittings of the
fathers were suspended for two years. On November
29, 1550, the then pope, Pius IV., convoked it for
the following Easter. The decree of reformation of
moral laws and government, consisting of eighteen
chapters, was adopted in the 52d session. It con-
tained a number of important provisions on the
residence of bishops and parish priests, upon the
qualifications for the priesthood, and for the erec-
tion of seminaries for clerical training. In the 25th
session was passed a series of regulations for the
bishops as a body. The fact is that the council was
then formally confirmed by Pius IV., in 1564. By its declarations on dogmatic theology
the church gave prominence to the differences
existing between Catholics and non-Catholicks, and
thus more sharply divided Christendom into the
spiritual and earthly branches of the church.
The cause of Catholic reform dominated the policy
of Paul IV. (1555-59), and from his time the
constitution of the Roman see in its modern aspect progressed practically without a check.
In this period, too, falls the establishment of adminis-
trative bodies called 'seated congregations,' which
thereafter are the recognised and usual organs for
the exercise of papal power in the government of
the church. Lesser objects were not neglected.
If modern Rome has been for so long the city in
Europe which has attracted and deserved to attract
the crowded and admiring crowds, it is largely due to the continuation during this period
of the works begun under the inspiration of
Nicolas V. It is often forgotten that St Peter's
itself was not completed till 1626.

(2) By the beginning of the 17th century the
papacy was in a remarkable position. It was
in accordance with the circumstances induced by the
Protestant Reformation. Its history in this second
period shows no such stirring events as had marked
the preceding age. But for its future the transfer
of the weight of political power from the House of
Austria to that of France in the second half of the
17th century determined the election of Cardinal Alberoni, to whom was
given the whole weight of the influence of France.
As Clement XI. (1700-21) was in the most im-
portant acts of his reign inspired by Louis XIV.
To our story the reader is referred. The first half of the
18th century, the position of the papacy in its
relations with princes and peoples remained as
it had been before. To some extent also it is
certain that Benedict XIV. (1740-58), by a charm
of character which impressed even one so keenly
alive to the weak side of humanity as Walpole,
stayed off the evil day. But before his death the
signs of disintegration were unmistakable.
Throughout Europe luxury and an accompanying
dissoluteness of manners had increased to shame-
lessness, whilst the school of infidelity in France
began to work as national as papal. The
full effect, moreover, of the displacement of the
imperial House of Austria as the political prop
of the church in favour of France now made itself
manifest, and the Jansenist troubles of the 17th
century bore bitter fruit. The whole church of
France had become involved in the quarrel.
the one side the bishops nominated by the king, insisted, as in duty bound, upon the acceptance of the bull Unigenitus issued by Clement XI., in 1713, whilst on the other a large body of the clergy and a not less large body of the laity resisted a bull involving assent to a lengthy series of abstract theological propositions. Of the violence of these theological disputes, as well as the ulterior motives likely to form an idea, and more than one cool observer believed schism in France to be imminent. Thus, whilst the papacy needed every aid to stem the rising tide of infidelity, it found those on whose help it should have been able to depend involved in infidelity. The inauspicious character of the 19th century was for the papacy a slow agony, the successive stages of which do not call for notice here.

By the suppression of the Jesuits the papacy not merely deprived itself of an able body of strenuous defenders, but cast by the very act dismity among the ranks of many devoted to the church. Moreover, the manner of the fall of the Society of Jesus was not calculated to lessen the weight of responsibility, or it may be said the odium, attaching to so grave an act. It fell with dignity, and the cruelties inferred to have been committed brought forth in unlikely quarters sympathy for the victims. It was natural that onlookers should be more impressed by these more recent occurrences than by the long chain of events which had brought the holy see to view the suppression of the Order as inevitable.

All the principles, all the decrees, were, above all, a fall away, and the Emperor Joseph II. assigned to himself and exercised functions which the popes had ever claimed as pertaining to the supreme ecclesiastical power. The fruitless journey of Pius VI. (1789) to confer with Joseph II. at Vienna in 1782 is the sad proof of the degradation of the papacy. Before long the Revolution which broke forth in France swept away king and priest and all established institutions in church and state, involving Catholic Europe in disorder. An outbreak in Rome fomented by the agents of the French ambassador, forced the pope from Rome as a prisoner (1798); and, after his removal from one place of confinement to another, Pius VI. died at Valence on 29th August 1799, Napoleon having, two years before, in anticipation of his death, given orders on the 1st of January 1797 that he should be elected, and that the papacy should be abolished.

A few words must still be given to the present and fourth period of the modern age of the papacy. Through the instrumentality of schismatic Russia the conclave of cardinals met in the monastery of St Giorgio Maggiore at Venice on the 1st of December 1799. The conclave lasted for nearly four months. Just as the conclave of 1700 was decisive as regards the fortunes of the papacy in the 18th century, so was this of 1800 as regards the 19th century. The possible candidates were numerous; the choice finally rested on the Benedictine cardinal, Chiaramonti. Nothing better illustrates the confusion of ecclesiastical ideas in the 18th century, or a chief source of the weakness of the church, induced by universal suspicion, than the extraordinary impression used by a member of the conclave, Cardinal Langini, in his private diary. Explaining the objections felt by some in the conclave to Chiaramonti, he notes under 12th March 1800, only two days before the election, 'Chiaramonti, as a Benedictine, being suspected of Jansenism.

No one who reviews the history of the 19th century can doubt that events have justified the choice of the cardinals. After enduring shocks which to human eyes seemed to threaten its very existence, the Church proves to be the greatest entity of the greatest potency in the civilised world. That this is so is largely the result of the personal character of Chiaramonti, the new pope, who as Pius VII. (1800-23) combined a conciliatory temper with an uncompro-mising inflexibility when vital principles were involved. The history of his relations with Napoleon I. is sufficient of itself to explain how he, destitute apparently of all human help, won for himself the respect of those who thought that the ablest of statesmanlike minds of the century to the service of the church; and under him and his successors was accumulated a reserve of Catholic strength which is one of the most interesting and remarkable features of the 19th century.

The successors of Pius VII. by the personal purity of their lives contributed greatly to advance this Catholic revival. The reigns of Leo XII. (1823-29), Pius VIII. (1829-30), and Gregory XVI. (1831-46) witnessed an increase of zeal on the part of the Holy See in every way for the development of the spirit of loyalty to the holy see both in them and in the ranks of the Catholic laity. In France the exertions of Montalembert, Lamennais, and others firmly established a new school, which, whilst professing enlightened liberal doctrines, was based on the simple conviction that the development of the spirit of loyalty to the holy see can be accomplished only by an intimate union of its adherents with the Church.

the pontiff issued a circular to the bishops of Ireland in which he condemned as immoral burning and cutting the Plan of Campaign. In June 1801 the pope published an encyclical, addressed to the Catholic bishops, dealing with the principles which should govern the consideration of the questions involved in struggles between capital and labour.

Christ., by Bryce's Holy Roman Empire; Creighton's History of the Papacy during the Reformation; Bancroft's History of the Popes; Eustach's History of the Popes; Heeren, Geschichte der ital. Kirche in den Jahren 1485-1610 (trans. 1892-98); Gregorovius, History of the City of Rome in the Middle Ages (1890-92); and various collections of documents, such as the Regesta Pontificum Romanorum, edited by Jaffé. See also the articles BULL, ENSICALIC, INFALLIBILITY, SEM, NORMANS, REFORMATION, ROMAN CATHOLIC CHURCH; and the separate articles on the chief of the popes, as given in the following list, in which the order and dates of accession are taken from P. B. Game's Series Episcoporum, the names of the antipopes being given in italics.
Pope, Alexander, the greatest poet of his age, and the most brilliant satirist that England, or perhaps the world, has ever produced, was born in London on the 21st of May 1688. He was of good middle-class parentage, but not, as he afterwards characteristically endeavoured to make out, of aristocratic descent. His grandfather, Alexander Pope the elder—whose pedigree he attempted to disguise—is said to have been the Orcades, or Earl of Haddington, who was a clergyman of the Church of England. His son, the poet's father, was placed with a merchant at Lisbon, where he became a convert to the Roman Catholic Church. On his return from Lisbon he seems to have followed the trade of a linen-draper in Broad Street, whence, after his marriage with Edith Turner, the poet's mother, he migrated to Lombard Street. Here, on the above-mentioned date—once the subject of much perplexing controversy, but now satisfactorily ascertained—Alexander the younger first saw the light. In his infancy, and indeed up to the age of ten, he does not seem to have been either weakly or deformed. In the opinion of a kinsman, 'it was the perpetual application he fell into in his twelfth year that changed his form and ruined his prospects in life.' This assertion has been repeated in his life, but it is now submitted to and aggravated a misfortune which could hardly have been due to any such cause alone. It is at any rate certain that Pope's application to study must have been both early and intense, for deep traces of thought and culminating arguments are preserved in his penny-press, a product of genius even in his most juvenile poems; and he certainly owed little to his teachers. His education, thanks no doubt to the disabilities created by his inherited crookedness, was unmethodical and imperfect to the last degree. He seems to have passed from the Latin and Greek rudiments, to Blinfield near Wokingham, to which place his father had by that time retired. Yet in this very year he wrote his Ode on Solitude, an insignificant but not unpromising performance, and at fourteen, according to his own account, he composed the poem on Silence, in imitation of Rochester's Nothing, which both in manner and matter is astonishingly nature. It was at the same age that he produced the first of his works which attracted attention, a Translation of the Iliad, a poem memorable above its intrinsic merits from the fact that in it the English heroic idiom, though of course falling far short of the technical perfection to which Pope afterwards brought it, is already beginning to take the new mould into which, in his hands, it was destined to become. It is during the next two years, that is to say, at the marvelously early age of from sixteen to eighteen, that Pope's career as a recognised English poet may be said to begin. For it was at some time during these years (1704-6) that he wrote his Pastorals, which, though not published till 1709, were shown to and highly commended by all the leading critics of the day, and were the means of bringing their young author acquainted with the dramatist Wyndham, whose works were quickly recognised, and with whom he commenced a singular correspondence, the tenor of which he audaciously misrepresented in later life. It was to Wycherley, too, that Pope owed his first introduction, which took place a little later, to London life, where the youth's extraordinary Wyndham talents were quickly recognised, and where he was not long in establishing a friendship with Addison, Steele, Swift, Arbuthnot, and other famous wits and poets of the day. In 1711 he published his Essay on Criticism, a poem which, whether written in 1709 or 1707—and it may have been his invincible habit of committing small acts of dishonesty for still smaller gains that suggested the early date—was a sufficiently splendid achievement for the age either of nineteen or twenty-one. It at once, or nearly at once—for it hung for a little at first at the booksellers—placed him in the front rank of the men of letters of his time. Critical opinions differed, and down to his death, which came on the 30th of January 1744, he continued to differ, as to the degree of merit possessed by this remarkable poem in respect of its matter—some deprecating its critical aphorisms as platitudes, others elevating them into utterances of gnomic wisdom; but its excellences of form are not open to question in any competent judgment. Young as was the author, even on the highest computation of his age, his style had already reached maturity, and his matchless power of expression is here exhibited, if over a less varied subject-matter, yet certainly with a no less anorming mastery than in any of his later works. The year 1715 witnessed the publication of The Rape of the Lock (written, according to Pope's account adopted by Warburton, in 1709), a piece much admired in its day for the accuracy and force in its description of nature; and this was succeeded by that second poem on which Pope's claim to the gift of poetic imagination may perhaps be most securely rested, the Rape of the Lock. Necessarily precluded by the deliberate triviality of its subject from appealing to the higher emotions which imaginative poetry of the serious order arouses, this piece displays, in addition to the exquisite charm of its versification, a grace of delicate fancy which at times almost recalls the creator of Puck and Ariel, and the diviner of the dream-whispers of Queen Mab.

We now reach the commencement of what was probably the most prosperous period of the poet's life. His brilliant success had not yet brought with it much pecuniary profit, but in the year 1713 a project was set on foot by him, and warmly supported by Swift and others of his friends, which was destined not only to add to his fortune, but to place his fortunes on a substantial basis for life. This was the translation of the Iliad, a work published by subscription, in six volumes, intended to appear yearly; the last two, as a matter of fact, were issued together after six years' intermission in 1720. Most imperfectly representative, as might be expected from its great original, it is nevertheless a poem so remarkable for its union of force and elegance, and one which moves with an animation so inspiring and unflagging, that it can be read to-day with no inconsiderable portion of the pleasure which it gave to the contemporaries of the poet. The year of its composition was among the fullest and busiest of Pope's life. In 1716 his father removed from Blinfield to a house at Chiswick, where he resided till his death in the following year. Pope was now the foremost of the literary lions of fashionable London, and almost as universally a personage in the drawing-rooms of ministers and magistrates as in the coffee-houses of the wits. At this period, too, his mind, save for an interval of natural grief at the loss of his father, was probably as unrelated to any character of any very extreme virulence. In 1718 he purchased out of the early profits of the Iliad the famous villa and grounds at Twick-}

POPE

published in 1725 and the following years; and in 1727 appeared the first two volumes of a collection of letters of the first three books of Pope and Swift, a work famous as being the first shot fired in the war between the poet and 'the Dunce.' In March 1728 the third volume appeared, and the furious and scurrilous retorts wrung from the persons ridiculed in it elicited the retaliatory public

This work Pope represented as having been written in reply to their attacks, but it (or a first draft of which) has been ascertained by recent inquiry to have been in existence as early as 1725, and to have been merely withheld until its author he deliberately strong his enemies into a blind and headlong charge. Martinus Scriblerus, in fact, played the part of the lance with which the Spanish picador irritated the bull to frenzy; the Dunciad was the blade poised ready to transfix him. In this immortal lampoon—for it is too personal in all essentials of the word to deserve the title of satire—Pope has rescued the names of a host of insignificant enemies from oblivion; and it is the highest tribute to the extraordinary artistic power of this poem that it can still be read with a pleasure unimpaired by the absolute obscurity of most of its larger bonds, and be a bond of Pope and Swift later, of a more serious cast and of a more general application, and it contains one at least of the poet's most admired passages. But its incorporation with the earlier poem, with its infelicitous substitution of Cibber for Theobald as the personification of Dullness, is to be regretted. The Essay on Man, the first part of which was published in 1733, the Moral Essays, and The Imitations of Horace conclude the catalogue of Pope's poetic works. The first, a didactic poem, intended to commend to the world the not very profound philosophy which Pope had borrowed from Bolingbroke, is from the point of view of execution a masterpiece of weight and wit. The poet's mastery of terce and epigrammatic expression is here seen at its highest; and it has been declared, no doubt with truth, that the Essay on Man contains more lines which have won their way to the rank of universally familiar quotation than any poem of equal length in the language. The Moral Essays and the Imitations exhibited the same qualities exercised upon a series of selected subjects, of, for the most part, a lighter order; and, in the case of the still more famous Essay on Man, it is almost impossible to open a page without coming upon a line or a couplet which has become a household word.

The last few years of Pope's life were marked by no new creative activity, but devoted to the revision of his published works. He suffered during this period from asthma, which in time developed dropy, a disease which ultimately proved fatal to him. He died on the 30th of May 1744, at the age of fifty-six, leaving behind him a literary fame which, despite the passage of a century, is little dimmed even to this day. He had written or revised, in the year before his death, the Essay on Man. As a man the figure he presented to all but a few close friends was always an unamiable one, and modern research into the facts of his life has unfortunately only tended to deepen the impression. It cannot be said that his moral qualities of humanity were painfully prominent in the character of Pope. His vanity was insatiable, and his vindictiveness came near to be so: he committed acts of treachery to men, brutality to women, and ingratitude to both. He showed an extra-

friends. Yet it is certain that to these last he must have revealed many lovable qualities. He was undoubtedly a marked man, and his disposition when appealed to by the sight of want or suffering was genuinely benevolent. It should be remembered, too, in excuse for the acrimony of his satire, that physical misfortunes and accidents of bringing up had combined to render him morbidly sensitive. The application of any personal grief to which his revenge was not more cruel than his sufferings.

The position of Pope in the history of poetry is easier to fix than his rank among English poets; and the historian of literature can in these days assign him a far higher place in his challenge than any one else can. However ardent he can hope to secure for him in contemporary esteem. For the importance and splendour of Pope's con-

tribute to the development of English poetic art are beyond the denial of any one conversant with the facts. It is a truth superior to and independent of the endless and irreconcilable controversy as to the essence and 'true inwardsness' of poetic matter. The poets of the naturalist revival at the end of the 18th century regarded Pope as the brilliant exponent of a false and artificial theory of poetry which had on them Smyth and his followers, unceasingly, led men away from the contemplation of the 'true truth' of things. It has on the other hand been contended with much learning and ingenuity by Mr. Courthope that Pope's theory of poetry, if compared with that which it displaced, was a less distinct and salutary return to nature than that of which Cowper became the pioneer in the later half of the century, and which Wordsworth cherished and practised with such notable results towards its close. But even if this contention leaves us unconvinced, we can still find a very good reason for regarding as invaluable the services rendered by Pope to English poetry. He was virtually the inventor and artificer who added a new instrument of music to its majestic orchestra, a new weapon of expression to its noble armoury. Considered from the point of view of its descriptive and emotional capabilities, the heroic couplet as he received it from the hands of Dryden was an instru-

ment of vast compass but of modifications few and

rule. By force of exquisite sensibility wedded to untiring study Pope theoretically deduced and practically educated its hidden powers; discovered, formulated, and applied the still undiscovered 'discoursing' upon it; and handed it on to posterity in a form whose easy mechanical perfection is attested by the fact that its powers are but too much within the reach of the inferior performer. Considered as a weapon of expression, the heroic couplet of Dryden was a mediaval broadsword which only the mighty thews of its master could wield with any effect. In the hands of Pope it became a rapier of perfect flexibility and temper; and he himself discovered, and acquired mastery over, every trick of fence which it was capable of executing. But to the operation of the rules of art which have sufficed to perpetuate his name; but Pope has lived and will live in English literature, not only as the virtual inventor of a new poetic form, but as an artist without a rival in any age or language in the adaptation of speech to thought. No one who brings a sincere and informed sympathy to The Aeneid, the Epistle of Eloisa to Abélard will deny to Pope a measure of the lyrical gift and no mean power over the softer emotions. But one must admit that to the taste of the present age there occurs a certain coldness and artificiality in his portrayals alike of the face of nature and of the passions; and his verse appeals rather to the brain than to the heart. Ideas and not emotions are his province; but to the metric presentation of ideas he imparts a charm of musical utterance unachieved before his time, and a lucidity
of illustration: a brilliancy of wit, a command of apt and terse expression, and a combined ease and dignity of manner which have never been equalled since. To have done this is to have well deserved immortality as a man of letters; whether it is also to have done that to which the name of poet, the title of poet, the rank of poet, were understood in these days, every man who frames his own definition of poetry must decide for himself.

The editions of Pope have been fairly numerous. The first, by his friend Bishop Warburton, was an answer to Bolingbroke’s attack on Pope’s memory, and appeared within a year of his death. Joseph Warburton’s was virtually a reply to Warburton’s; and the controversy on the power of the poet was revived in the 19th century by Bowles and Roscoe, who each published an edition of his works, and in whose polemics a valuable part. All other editions, however, have been superseded by that of the Rev. Whitwell Elwin and Mr W. J. Courthope, which was founded on a mass of documentary material collected by the late J. W. Croker; the concluding volume, containing Mr Courthope’s biography of the author, was published in 1889. The annotations of the poems are rich and valuable, and the Life questions many of the received opinions of Papinian character and career which all his earlier biographers had lacked the material and some of the critical impartiality to determine.

Pope, John, an American general, was born in Louisville, Kentucky, 16th March 1822, graduated at West Point in 1842, and entered the engineers. He served in Florida (1842-44) and in the Mexican war, and was brevetted captain for gallantry. He was afterwards employed in exploring and surveying the west, until the outbreak of the civil war, when he was appointed brigadier-general of volunteers. In 1861 he drove the guerrillas out of Missouri; in 1862 he captured New Madrid in March and was made major-general, commanded the Army of the Mississippi in the operations against Corinth, and was assigned to the command of the Army of Virginia, with the rank of brigadier in the regular army. For fifteen days in August he faced Lee, but was defeated at the second battle of Bull Run, on the 29th and 30th. He then requested to be relieved, and was transferred to Minnesota, where he kept the Indians in check. He held various commands until 1886, when he retired. In 1882 he became major-general. Pope attributed his defeat at Bull Run to the conduct of General Fitz-John Porter, who was tried by court-martial and cashiered; but this verdict occasioned much interest in which General Grant ultimately took Porter’s side (American Review, December 1862), and in 1886 the latter was restored to the army. Pope died September 23, 1892.

Poperinge, an old commercial town of Belgium, in the province of West Flanders, 4 miles from the French frontier, and 8 miles W. of Ypres by rail. The town has manufactures of lace, linens, and woollen cloths. Pop. 11,065.

Popinjay (Fr. papigur, It. popagallo, Low Gr. papaeos), a parrot; a figure of a bird put up as a mark for archers to shoot at (popinigo being another Scottish form for this sense); see KILWINSING. The green woodpecker is also sometimes called popinjay.

Popish Plot. the name given to an imaginary plot of the Roman Catholics in England during the reign of Charles II., the object of which was believed to be a general massacre of the Protestants. See OATES.

Polar (Populus), a genus of trees, forming along with willows the whole of the natural order Salicaceae or Salicinse (by some regarded as a sub-order of Alcyonaceae) and having dog-eared flowers arranged in catkins, both male and female flowers with an oblique cup-shaped perianth. The seeds have silky hairs, as in willows, and are readily wafted about by the wind. The species are numerous, chiefly natives of the temperate and cold regions of the northern hemisphere. They are large trees of rapid growth, with soft wood, and broad, heart-shaped, ovate, triangular, or lozenge-shaped, deciduous leaves, on rather long stalks. Many of them are very beautiful trees. The catkins appear long before the leaves, and proceed from distinct lateral buds. Few of the poplars are of much value for their timber, which is generally white, soft, and light; but from their rapid growth they are useful as calking firewood, where the scarcity of other fuel renders it necessary to plant trees for this purpose, and they are often planted as ornamental trees, producing an immediate effect of embellishment in a bare situation more readily than almost any other kind of tree. Besides the species known by the name Aspen (q.v.), or Tremulous Poplar, the following seem the most worthy of notice. The White Poplar, or Abele (P. alba), a native of the southern parts of Europe, and reckoned among British trees, but probably not indigenous in Britain, is a tree of 80 feet or upwards, with a fine spreading head, and roundish, heart-shaped, lobed, and toothed leaves, which are smooth, shining, and dark-green above, downy and silvery-white beneath. The wood is used by cabinet-makers, turners, and toy-makers. It is little liable to rot or shrink, and this fact adapts it for various purposes. The tree loves low situations and clay soils. This tree has of late years been introduced in Britain from some unknown cause, like the potato, dying where it previously flourished; whilst other poplars, the most nearly allied, continue to flourish in the same localities. The Gray Poplar (P. cuneata) is very similar to the white poplar, but of more viscous growth, a large spreading tree, the leaves similar to those of the white poplar, but not so white green above or so white beneath. Branch and Male Catkin of Populus alba cuneata. 

Pope
POPPIN

appears to have been introduced into Europe from the East. It is very common in the Punjab and in Persia, and now also in Lombardy and other parts of Italy. It attains a height of 100, or even 150 feet, and is remarkable for its erect form, con- 
tracted head, and very rapid growth. It is often 
planted as an ornamental tree, although not so 
generally as in the end of the 18th century, when it was thought preferable for ornamental 
purposes to every other tree. It is common in 
the streets and squares of town in Britain, and 
is particularly adapted to situations where a long 
horizontal line of any kindfatigues the eye, or where 
it is seen starting up from a mass of lower wood 
or shrubbery. The wood is almost of no value. It 
is generally propagated by layers. The species 
known as Black Italian Poplar (P. monilifera or australis), although it is really a 
native not of Italy, but of North America, and is 
sometimes more correctly called Canadian Poplar, 
the female catkins of which resemble a string of 
pears, is frequently planted both as an ornamental 
tree and for the sake of its timber, which is useful 
for flooring, &c. The leaves are deltoid. It is of 
very rapid growth, and attains a height of 100 to 
120 feet. The Balsam Poplar, or Tacamahac (P. 
balsamifera), a very common ornamental tree in 
Britain, is a native both of North America and of 
Siiberia, and has ovate-oblong leaves, which in 
spring are of a delicate yellow tint, and have an 
agreeable fragrance. The leaf-buds are viscid. 
The resinous exudation of the buds (Tacamahac, q.v.) 
is said to be diuretic and anti-spasmodic; and an 
ointment made from the buds is used for burns, 
wounds, and burns. The resinous exudation of 
the buds of other species, as the black poplar, 
possesses similar properties. The Cottonwood (P. 
canadensis) of North America, particularly abund-
ant on the upper parts of the Mississippi and 
Missouri, is valued as a timber-tree, and has been 
pretty extensively planted in Britain; as has also 
the Ontario Poplar (P. canadensis), a species with 
the same balsamic character as P. balsamifera, 
and chiefly distinguished from it by its larger 
leaves. In size of leaf no other species equals P. 

cquerophylla, a native of the southern states of 
North America, the leaves of which are often 
6 inches long. See Aspen.

Poplin (Fr. popeline; possibly from the town of 
Poperinge, of which an old spelling is Pop-
peling), a fabric which has been long made in 
France, from which country the manufacture 
was introduced into England and Ireland in the 17th 
century by Protestant refugees. Poplin con-
sists of a warp of silk and a woof of worsted, 
and the latter being thicker than the former pro-
duces a corded appearance. The worsted yarn 
gives substance to the fabric, and a soft silky 
face is produced by the way in which it is woven. 
Poplins may be either plain or figured. Irish 
plipins are nearly all made in Dublin; the 
industry has been subject to great fluctuations, 
notwithstanding the efforts to foster it. Figured 
poplins, which were much used about 1870 for 
curtains and covering furniture, are at the present 
time, in Great Britain at least, employed for these 
purposes only to a limited extent.

Popocatepeti ('smoking mountain'), a vol-
cano about 40 miles SE. of the city of Mexico. It 
risen in the form of a cone to a height of 17,784 
feet above the sea-level. No eruption has been 
recorded since 1540; it still smokes, however. It 
is often scaled, and is surrounded by its crater (5165 
feet in diameter, and nearly 1060 deep) a good 
deaI of sulphur is obtained.

Poppy (Pappaver), a genus of plants of the 
natural order Papaveraceae, having a calyx of two 
(or rarely three) sepals, which very soon fall off; 
a corolla of four (rarely six) petals; numerous 
stamens seated on a receptacle; the stigma crown-
ing the ovary, without a style, and in the form of 
4 to 20 rays; the capsule opening by pores under 
the persistent stigma, imperfectly divided into cells 
by partitions as numerous as the rays of the stigma, 
but which do not reach the centre, and the seeds 
extremely numerous. There are numerous species 
of poppy, mostly natives of Europe and Asia, some 
of them found even in very northern regions, but 
most of them in the warmer temperate parts. They 
are herbaceous plants, annual, biennial, or peren-
nial, mostly sprinkled with bristly hairs. They 
have a white milky juice; a disagreeable narcotic 
smell, particularly when bruised; pistillate or 
bipinnatifid leaves, more rarely jagged or toothed 
leaves; and large showy flowers, which readily 

Opium Poppy (Pappaver somniferum):

a, whole plant; b, flower and leaf; c, ripe capsule; d, seed 
and section of do. enlarged. (Bentley and Trimen.)
PORCUPINE

France and elsewhere as another article of food. It is believed that one-half of the oil used for cooking and otherwise for alimentary purposes in France is of this kind. The seeds yield about 40 per cent. of oil, and the oil-cake is useful for manure or for feeding cattle. The oil is sometimes used by painters and by soap-boilers; but it is not good for burning. In the cultivation of the porcupine for oil the seed is often sown in autumn, where the severity of winter frosts is not to be feared; in more northern parts it is sown in spring, and sometimes the seed is scattered on the top of the snow with which the ground is covered. Being very small it needs little or no harrowing. Early sowing is favourable to the size of the plant and the abundance of produce. Hoeing and thinning are advantageous. An open but rich soil is best for the porcupine; and a sheltered situation is necessary, as in exposed situations much of the seed is scattered by the wind. The porcupine does not exhaust the land so much as cola, rape, and some other oil-plants. Harvesting ought to begin when one-fourth of the capsules of each plant are open. It is accomplished by pulling the plants in such a manner as not to shake the seed out of the capsules, and tying them in sheaves, which are placed together in a large or slightly concave position until the ripening of the capsules is completed, when the seed is taken out by shaking the capsules into a tub or on a cloth, great care being used to prevent any earth from the roots getting mixed with them. Some farmers in Flanders sow poppies in alternate rows with carrots. The variety of poppy chiefly cultivated as an oil-plant has flowers of a dull reddish colour, large oblong capsules, and brownish seeds; but the white-flowered variety, with globular capsules and white seeds, is also used. The Oriental Poppy (P. orientalis), a native of Armenia and the Caucasus, a perennial species, is often planted in gardens on account of its very large, fiery-red flowers. Its unripe capsules have an acrid, almost burning taste, but are eaten by the Turks, and opium is extracted from them. Several species are cultivated in Britain, all of them seed, rather than tuberous plants, and troublesome weeds in cornfields in other places apparently quite similar in climate. Among them is the Corn Poppy or Common Red Poppy (P. rhoeas), with bright-red flowers, and deeply pinnate leaves. The petals are mucilaginous and are sometimes eaten; they have a slight narcotic smell; and a syrup made of them is sometimes used as an anodyne in catarrhs and children's complaints; but they are more valued for the rich red colour which they yield. A variety with double flowers is cultivated in flower-gardens, under the name of Coronation Poppy. Among the ancients the poppy was sacred to Ceres.

Poppy-head. See Pews.

Porcupine. A name given to all the members of a family of Rodentia—the Hystricidae. This family contains a number of well-defined genera, which include a good many species. The Common Porcupine (Hystrix cristata) is found in southern Europe, as well as in Asia and Africa, and is one of the largest of rodents; it has a heavy aspect and a grunting voice, whence the name Porcupine (from the French porc, 'a hog,' and spin, 'a spine'). The porcupines of the New World are sometimes included in a separate family; they comprise two well-marked forms—the Erinus (Erethizon dorsatum) of North America and the Prehensile-tailed Tree Porcupines (Cerocetes) of South America. The most marked peculiarity of the porcupine is of course the presence of the quills, which are simply thickened hairs; graduations between ordinary hairs and the thickest and longest spines exist to

Porch of Aldham, Essex (1390).
prove this statement. Occasionally the spines end in a peculiar cup-shaped extremity. The armature of spines is of the greatest value to the porcupine, though their use is entirely for defensive purposes. It is hardly necessary to deny the popular belief that the animal can shoot out its quills like so many arrows; the notion has arisen from the fact that when the animal erects its spines loose ones, sometimes fall out. See ECHIDNA, GLOBE-FISH.

Pordage. See PHILADELPHIANS.

Pordaneone. It, a name for the religious painter Giovanni Antonio Licioino (1483–1539), born near Pordenone in Venetia.

Porifer. See SPONGES.

Porism is defined by Simson as a proposition to demonstrate that some one thing or more things are given, to which, as also to each of innumerable other things, not indeed given, but having the same relation to those which are given, it is to be shown that there belongs some common affection described in the proposition. Playfair defined a porism to be a proposition affirming the possibility of finding such conditions as will render a certain problem capable of innumerable solutions. Owing to the loss of Euclid's three books on porisms, and the obscurity of the account given by Pappus of their contents, there has been much discussion among geometers as to the nature of a porism. The two most important books on the subject are Simson's De Porismatibus in his Opera Religionis (1726), and Chasles's Les trois livres de Porismes d'Euclide (1860). Chasles is of opinion that the porisms were closely allied to the modern theories of anharmonic ratio, homographic division, and involution.

Pork. See Pig for the animal from which pork is procured; DIRT and FOOD for the properties of pork as an article of food; and TUTCHINOSIS for one of the gravest of the diseases affecting the pig. The great headquarters of the trade in pork is the United States. This is partly indicated by the figures given at CHICAGO and HAY; but it will be shown more clearly by the following figures. In 1890 the total number of pigs in the United Kingdom was 2,773,609; in the United States it was in the same year 51,002,780, with a value of $843,418,336. While Britain imports pigs and pig-products (hams, bacon, pork, and lard) to a large extent (mainly from America), the United States exports on a vast scale. In the fiscal year 1889–90 the exports were as follows: hogs, 91,148; bacon, 581,896,677 lb.; hams, 76,591,279 lb.; fresh pork, 279,463 lb.; pickled pork, 79,788,878 lb.; lard, 471,028,238 lb. The value of these pig products in that one year 1889–90 was over $67,670,000.

Porosity. By this term we express the experimental fact that no kind of matter completely fills the space it occupies. On the atomic theory it is obvious that this must be the case if the atoms of matter are spherical, or, indeed, if they have any form save one or two special ones, such as cubes or rhombic dodecahedrons. The Phlogiston philosophers, in their attempts to compress water, proved the porosity of silver by flattening a sp. 're of that metal, filled with water and soldered, 'to water escaped through the silver, and stood in thin drops on its surface. The porosity of liquids is easily shown by mixing alcohol and water. The bulk of the mixture is considerably less than the sum of the liquids of the components.

Porous Jars. See REFRIGERATION.

Porphyrite, one of the crystalline igneous rocks. It consists principally of plagioclase. The ground-mass of the rock is composed of microlites and minute rod-like crystals of plagioclase, dispersed amongst which may occur crystalline granules of hornblende, augite, rhombic pyroxene, mica, ilmenite, magnetite, &c. Sometimes traces of a glassy or devitrified base can be detected. Throughout this ground-mass are scattered porphyrrically larger crystals of plagioclase accompanied by one or more of the following minerals: hornblende, augite, rhombic pyroxene, mica, &c. The rock shows all varieties of colour, and ranges in texture from vitreous and crypto-crystalline up to coarse-crystalline. It is often vesicular and amygdaloidal. It occurs almost as a ring round the summit of the extinct volcanoes of the hill-ranges of the Lowlands, both in the form of lava-flows and intrusivesheets, dykes, and masses. Porphyrite is so closely allied to Andesite (q.v.) that it may be considered as merely an altered variety of that rock.

Porphyrogenitus (Gr., 'born in the purple'), a title given to the Byzantine emperor Constantine VII. (912–959).

Porphyry (Gr., 'purple'), a term originally confined to an Egyptian rock used in sculpture and known as porfido rosso antico. It occurs as a dyke or vein some 60 to 80 feet thick in the granite of Jebel Dokhan (formerly called Mons Porphyrites) in Egypt, between Siout and the Red Sea. It is composed of a felspathic base, in which are disseminated crystals of oligoclase felspar, with some plates of dark hornblende, and grains of an iron oxide. The beautiful pink or red colour of the porphyritic felspar and the fine-grained base is due to the diffusion of the red pseudomorphs of pyroxene through the ground-mass or Piochnomite. The term porphyry is now not used to denote any particular rock, but is applied by architects and others to any igneous rock which, like the porfido rosso antico, has a homogeneous, compact base or fine-grained ground-mass, through which are scattered distinct crystals of one or more minerals. By geologists the term porphyry is seldom used without some descriptive word bracketed with it, as quartz-porphyry, orthoclase-porphyry, augite-porphyry, &c.

Porphyry, one of the greatest Neoplatonist philosophers, was born at Tyre, or at Batanes, in the latter part of the 2nd century (Har. Melch. 'king'); and Porphyry ('one clad in purple') is but a kind of playful synonym for this royal name. He is said by Socrates the historian and by St Augustine to have been originally a Christian; but this seems improbable, although it is unusual that a pagan who was the heir of Origen, or at least held some intercourse with him at Caesarea in Palestine. What is more certain is that he passed at a later time to Athens, where he studied rhetoric under Longinus, the well-known author of the treatise On the Sublime. It was at Rome, however, that he remained about 263, that he found the master who permanently moulded his life. Here he became the most trusted of the disciples of the Neoplatonist

Common Porcupine (Hystrix cristata).
Porson, after a few years in Rome he went to Sicily, where, if St Jerome's account is to be relied on, he wrote his once celebrated treatise in fifteen books against the Christians, now known only from the replies—themselves lost—which it elicited from Methodius of Tyre, Eusebius of Cesarea, and Apollinaris of Laodicea. His book itself was burned by order of the emperors Theodosius II. and Valentinian in 448. He then returned to Rome, and taught there, where he is said to have died, probably about 470. His own most famous pupil was Jambiclus. For a view of Porphyry's position in the history of the Neoplatonic school, see Neoplatonism. He was a very voluminous writer, and, though no very profound thinker, a learned, capable, earnest, and high-minded man. His philosophy keeps close to life and practical duties, its object the salvation of the soul, to be effected by the extinction of impure desires through strict asceticism together with knowledge of God. He was a determined opponent of Christianity, and in his treatise criticized many of its supposed errors and imperfections.

Of his writings the chief are the Lives of Plotinus and Pythagoras; Sententiae; De Abstinentia; and the Epistolæ ad Marcellum, addressed to his wife. There is a complete list in Fabrii's Bibliotheca Græca, v. ed. Harless. See also the lexicons of Vachier and Jules Simon, and Zeller's Philos. der Griechen, vol. ii.; also the monograph by Bouillet (Paris, 1864).

Porpoise (Phocaena). Porpoise is a genus of Cetacea in the family Delphinidae. The species are like dolphins, but have shorter snouts. The Common Porpoise (F. communis) is the most familiar Cetacean on the British coasts, especially to the west of Ireland and Scotland. It is found also on all the coasts of Europe from the Mediterranean northwards, on the coasts of North America, and in the Arctic regions. It is one of the smallest of the Cetacea, its average length not exceeding four feet, although individuals may measure six feet in length. The body is spindle-shaped, its greatest diameter being near the triangular dorsal fin. The skin is perfectly smooth, and destitute of hair. The upper surface is black with a bluish shimmer, but the under side is greyish white. There are from forty to fifty teeth in each jaw, not conical, as in most of the Cetacea, but compressed. The eye is small; the opening of the ear is very minute, like a hole made with a pin. The crescent-shaped blow-hole, with the burns of the crescent directed forwards, is situated exactly over the eyes. The porpoise is gregarious, and large numbers are often seen together, sometimes swimming in file, when their backs, appearing above the surface of the water, suggest the idea of a great sea-serpent; sometimes swimming in fine weather, or when storm is approaching, or even in the midst of a storm. They feed on fish, which the teeth are admirably adapted to catch, and schools of porpoises pursue the vast shoals of herring, mackerel, &c.
He also opened a correspondence with the veteran scholar David Ruhnken of Leyden. His Note brevis ad Tontii Emendationes in Suidam (1790) fired the beyond the one he was a scholar of the highest rank. In 1797 appeared in the Gentleman's Magazine his three sarcastic letters on Hawkins' Life of Johnson; and during 1798 and 1799, in the same periodical, his far more famous and trenchant Letters to Archdeacon Travis, on the Bourke of Veres and Coll. 1799—'the most acute and accurate piece of criticism since the days of Bentley,' says Gibbon. Porson naturally incurred great odium on account of the side which he took in this controversy, and it is said that one old Norwich lady, who had him in her will for a legacy of £300, cut it down to £30 when she heard that he had written a book against Christianity. In 1792 his fellowship ceased to be tenable by a layman, whereupon some friends raised a fund to preserve him from want, and about £100 a year was secured. This he accepted on condition that after his death the money should be returned to the donors, but when they refused to take it back it was used to form a foundation for the Porson prize at Cambridge. He was also appointed to the regius professorship of Greek in the university of Cambridge worth £30 a year.

In 1795 he edited the plays of Eschylus for the Foulis press at Glasgow, and between 1797 and 1801 four of Enquiries, the Hecuba, the Orestes, the Phenissar, and the Medea. He also collated the Harleian MS. of the Odyssey for the Grenville Hours. He married in 1796, but his wife died five months later, to her grief and his of his dilatory and slovenly habits and his thirst for drink. In 1800 he was appointed librarian of the newly-founded London Institution, with a salary of £200, but neglected his duties. He was suddenly struck down with the bilious, the 7th September 1808, and died six days later. He was buried in the chapel of Trinity College, Cambridge. Porson possessed a stupendous memory, unwearied industry, great acuteness, fearless honesty, and masculine sense, but was hindered all his life by poverty, ill-health, dilatoriness, and fits of intemperance. With all his powers he achieved but little, and to justify contemporary admiration there remain, besides the works already named, but a few bon-mots, some brilliant emendations, the posthumous Adversaria (1812), and notes on Aristotle the lexicon of Photius (1822), Paussanias (1820), and Suidas (1834). His Tracts and Criticisms were collected by Kidd (1815).

See 'Porsoniana' in Rogers' Table-Talk (1856), H. R. Luard in Cambridge Essays (1857), and the Rev. J. Selby Watson's Life (1881). His Correspondence was edited by Luard for the Cambridge Antiqu. Soc. (1897).

Port. See STEERING; also PORT WINE.

Porta, GIAMBATTISTA DELLA, Neapolitan physiologist (1543-1615), wrote numerous works on physiology, gardening, arboriculture, pneumatics, and refraction, besides several comedies; his best-known books being Magia Naturalis (1569) and De Humanis Physiognomonia.—For Bacio della Porta, see BARTOLOMMEO.

Port Adelaide. See ADELAIDE.

Portadown, a market-town of Armagh, Ireland, on the Bann, 6 miles S. of Lough Neagh and 25 miles by rail S.W. of Belfast. It is a place of considerable trade in agricultural produce, and manufacture of linen, cambric, and sheeting. Pop. (1871) 6735; (1881) 7890; (1901) 9530.

Portage City, capital of Columbia county, Wisconsin, is at the head of navigation on the Wisconsin River, and on the ship-canal which connects it with the Fox River, 177 miles by rail N.W. of Chicago. Steamboats ply to Green Bay, Lake Michigan. Portage has grain-elevators and iron-works, and manufactures leather, boots, clothing, &c. Pop. (1890) 4346; (1900) 5439.

Portage in Prairie, the market-town of a rich agricultural district in Manitoba, on the Assinibine River, 56 miles by rail W. of Winnipeg. It has flour-mills and grain-elevators, a brewery, a biscuit-factory, a paper-mill, &c. Pop. 3000.—In North America portage (from Fr. porter, 'to carry') means a place where boats or canoes have to be lifted past or carried across one navigable stream and another.

Portalis, JEAN ETIENNE MARIE (1745-1807), jurist, practised law in Paris, was imprisoned during the Revolution, but under Napoleon was chief author of the Code Civil. See CODE.

Portal Vein. See LIVER, CIRCULATION.

Portarlington, a market-town of Ireland, partly in King's County, partly in Queen's County, on the Barrow, 44 miles by rail S.W. of Dublin. It was granted by Charles II. to the Earl of Arlington; and here William III. planted a colony of French and Flemish refugees. In 1712 it returned one member to parliament. Pop. 2357.

Port Arthur, the terminus of the eastern division of the Canadian Pacific Railway, on Thunder Bay, Lake Superior, 993 miles NW. of Montreal. Pop. 3500. See OWEN SOUND.

Port Arthur, or LUSHUNKO, a naval station and arsenal on the peninsula stretching south into the Gulf of Pe-chili, opposite that of Wei-hai-wei, on the Shantung promontory to the south; together they command the entrance to the gulf. The English name is derived from the caption of one of Her Majesty's ships employed in surveying the coasts of Corea and Manchuria. In the middle of the century a miserable fishing village, the port was fortified and provided with docks, electric light, a lighthouse, &c., with the help of German engineers. It was taken by the Japanese in November 1894; and in 1895 it and Ta-lien-wan, on the east coast of the peninsula, were 'leased' to Russia (nominally for 25 years, with power to extend the term). Russian control became absolute in 1894 because of the treaty. The port is small but Russian and Chinese ships; part of Ta-lien-wan is similarly closed. Wei-hai-wei, taken by the Japanese in January 1895, was held by them till 1898, when it was taken over by Britain, to be held under the same conditions as Port Arthur is by Russia. The harbour is shallow, and exposed to some winds, but both strategically and as a coaling-station is important.

Port-au-Prince, the capital of Hayti (q.v.), is situated on the western coast, at the head of a bay of the same name. Pop. 20,000.

Port Breton, in the E. of New Ireland, Bismarck Archipelago, was in 1759 the scene of a disastrous experiment in colonising by French Legitimists under the Marquis du Rays.

Portcellis, a strong timber or iron grating sliding in the jams of the entrance to a castle, which, when dropped to the ground, defended the gate from assailants.

Port Darwin, a magnificent landlocked deep-water harbour of the Northern Territory of South Australia, near Port Orderton, the seat of a port on its shores, is the terminus of the overland telegraph, 1973 miles from Adelaide, and of the cable to Java, and is the starting-point of a short railway (146 miles); pop. 800.

Port D'Envaux. See DURBAN.

Port Dunkirk, a harbour in British East Africa, a little more than 1° S. of the equator.

Porte. See CONSTANTINOPLE.
Port Elizabeth, a seaport of the British colony of the Cape of Good Hope, stands on the western shore of Algoa Bay, by rail 85 miles SW. of Graham's Town and 350 S. of Kimberley. It is the southern gateway of the Cape Colony, and also of the Orange River Free State. Its public buildings, solid and substantial edifices, are the town-house, the provincial hospital, churches, the Grey Institute, a college, a library (20,000 volumes), a museum, &c. There are two parks and several grass-planted squares. The town was founded in 1820, and the population, which was not much above 4000 in 1855, had grown to 13,049 in 1875, and to 23,266 in 1891. Two piers were constructed to protect the harbour in 1881; and an aqueduct, 29 miles long, has brought good water to the town since 1878. The value of the imports has increased from £376,638 in 1855 to an average of about £3,990,000; that of the exports (mainly wool, with ostrich-feathers, Angora goats' hair, and diamonds) from £384,447 in 1855 to an average of some £2,000,000.

Porteous Mob. At Pittenweem in Fife, on the night of 10th January 1736, three smugglers, Andrew Wilson of Kirkcaldy, George Robertson, an Edinburgh innkeeper, and William Hall, robbed the Kirkcaldy excise-collector of over £100. All three were at once arrested, and on 11th March were sentenced to death. In an attempt to break out of the Tolbooth (the 'Heart of Midlothian'), Wilson, 'a squat round man,' stuck fast in a grating, preventing also the escape of Robertson; but the following Sunday, being taken with him to hear the condemned sermon in St Giles' Church, he suddenly seized two of the four soldiers guarding them, and fastened with his teeth upon a third, at the same time crying, 'Run, Georgie, run for your life.' Robertson did not get clear off; Wilson on 14th April was hanged in the Grassmarket. There was some disturbance and stone-throwing, when Captain John Porteous, the brutal commander of the City Guard, fired on the crowd, and killed or wounded sixteen or more men and women. For this he himself was tried and sentenced to death (20th July), but on 26th August was reprieved by Queen Caroline. However, on 7th September an orderly mob burst open the tolbooth, dragged Porteous out, bore him, pleading for mercy, to the Grassmarket, and lynched him—hanged him from a dyer's pole, and slashed at him with Lochaber axes. A drunken footprint of Lady Wemyss and one other man were tried next year for their share in the riot; but both were acquitted, and none of the ringleaders ever was brought to justice. A bill passed the Lords to disqualify the Lord Provost of Edinburgh from ever again holding office, to imprison him for a twelvemonth, to abolish the City Guard, to raise the Nether Port, and to fine the city in £1500 for Porteous' widow; but only the first and last clauses were carried in the Commons, and these only by a casting vote and after the fiercest opposition from all the Scotch members. Indeed the Porteous Riot paved the way for the rebellion of the '45.

See vol. xvii. of the State Trials (1815); Scott's Heart of Midlothian (1818); and Criminal Trials illustrative of the 'Heart of Midlothian' (1818).

Porter, a kind of beer favoured by London porters, hence so called about 1750. See BEER, Vol. II. p. 37.

Porter, David, an American naval officer, was born at Boston, Massachusetts, 1st February 1780, the son of William Porter who had been through the Revolution. He was appointed midshipman in 1798, and lieutenant the year after; saw service against privateers in the West Indies, and against Tripoli in 1801–3; became captain in 1812, and captured the first British war-ship taken in the war. In 1813, with the Essex (32 guns), he nearly destroyed the English whaling-fishery in the Pacific, and took a number of the vessels. In 1814 he was sent to the British in Valparaiso harbour, and Porter returned home on parole. He afterwards commanded an expedition against pirates in the West Indian waters, and was court-martialled for compelling the authorisation of Porter's parole for imprisoning one of his officers. Porter resigned in 1826, and was for a time at the head of the Mexican navy. In 1829 the United States appointed him consul-general to the Barbary States, and then minister at Constantinople, where he died, 3d March 1843. Farragut, it is worth noting, was his adopted son. See the Life (1875) by his son.

David Dixon Porter, admiral of the American navy, who was born at Chester, Pennsylvania, 5th June 1813. He accompanied his father on his cruise against the pirates, and afterwards was for some time a midshipman in the Mexican service. He entered the United States navy in 1829, was employed on the coast survey from 1836 to 1841, when he became lieutenant, and then served till 1845 on the Mediterranean and Brazil stations, afterwards returning to the coast survey. From 1848 to 1853 he was engaged in command of the California mailsteamers. At the commencement of the civil war he was appointed commander of the steam-frigate Powhatan, and ordered to Pensacola; but afterwards he assisted in command of the mortar flotilla, joined Farragut, and in March 1862 was successfully bombarded the New Orleans forts. In command of the Mississippi squadron, he assisted to bring about the fall of Vicksburg (July 1863). A rear-admiral, he bombarded and silenced Fort Fisher in December 1864. Till 1866 he was in the naval academy at Annapolis, he was made vice-admiral in 1866, and in 1870 succeeded Farragut as admiral of the navy. He died at Washington, 13th February 1891.

He was the author of three romances, of Incidents and Anecdotes of the War (1861); A History of the Navy in the War of the Rebellion (1867).

Porter, Endymion (1587–1649), grooms of the bedchamber to Charles I., whom he accompanied (with Buckingham) to Spain, and attended on the field during the Civil War—without actually fighting—till 1648. He had a taste of poets and artists, and wrote many verses. See his Life and Letters by Miss Townsand (1897).

Porter, Jane, authoress of the Scottish Chiefs, was born at Durham in 1776, daughter of an army surgeon who died soon after her birth. She was brought up at Edinburgh and in London, and made a great reputation in 1803 by her high-flown romance, Theddeus of Waverc, which was distanced in its kind in 1810 by The Scottish Chiefs. The hero of the latter is a stilted and preposterous figure enough—as little of the historical Wallace as could well be, yet the book retains its interest for youthful readers, and had the merit of prompting Scott to complete Waverley. Other books were The Pastor's Fireside (1815), Duke Christian of Lüneburg (1824), Tales Round a Winter's Hearth (in collaboration with her sister Anna Maria, 1824), Howard of Effingham (32), The Field of the Foottest (32), The Seaward's Narrative of his Shipwreck and Consequent Discovery of certain Islands in the Caribbean Sea (1831), a clever fiction, edited by her, but almost certainly written by her eldest brother, Dr. Hill of the University of Scot. See and Queries, 1880). With this brother she spent some years at Bristol, and there she died, 24th May 1850.—Another brother, Robert Ker Porter (1775–1842),
was a clever battle-painter, and led a wandering life. He visited Russia on the emperor's commission in 1804, accompanied Sir John Moore's expedition in 1808, became knighted for small services of knight of Hanover in 1832, was afterwards British consul in Venezuela, and died at St Petersburg, whither his sister Jane had gone to join him, 4th May 1845. He published books of travel in Russia, Sweden, Spain, Portugal, Georgia, Persia, and Armenia,—his younger sister, Ann Maria Porter (1780-1839), blossomed precociously into Artless Tales (1793-95), followed by a long series of works, among which need only be named Octavia (1798), The Lake of Killarney (1814), The Hungarian Brothers (1807), The Recluse of Norway (1814), The First of Magdalen (1818), Honor O'Hara (1890), and Burony (1890).

Porter, Noah, philosophical writer, was born 14th December 1811, at Farmington, Connecticut, graduated at Yale in 1831, studied theology, and was for ten years a Congregational pastor. In 1846 he became professor of Moral Philosophy at Yale, and two years later became president of the college. One of the doctors received by him was the Edinburgh L.L.D. in 1836. Of his numerous works may be mentioned The Human Intellect (1868), Books and Reading (1870), Sciences of Nature versus the Science of Man (1871), Elements of Intellectual Science (1872), Elements of Mathematics (1885), Kant's Ethics (1886). Died 4th March 1892.

Port Erin, a port on the south-west coast of the Isle of Man, on Port Erin Bay, 55 miles W. of Castletown, has a breakwater 960 feet long, and a steamboat pier. One mile to the north-east there is a ruinous monument, Port Erin forms part of the parish of 3527.

Port Essington, an inlet in the Coburg Peninsula on the north coast of Australia, forming a fine harbour. On its shores there was from 1831 to 1850 a penal settlement.

Porteus, Belby, was the youngest but one of nineteen children, and was born at York, 8th May 1731, his parents being both natives of Virginia. He was educated at Ripon and Christ's College, Cambridge, and graduated as tenth wrangler in 1752. He was at once made a fellow of his college, took orders in 1757, and became domestic chaplain to Archbishop Secker in 1762. He was one of thesmallest of the Ranelagh and Witterings in Kent (1765), which he soon exchanged for the rectory of Hunton in the same county, the rectory of Lambeth (1767), the mastership of the Hospital of St Cross, near Winchester (1769), the bishopric of Chester (1776), and of London, in succession to Dr Lowth (1787). He resigned Lambeth when made Bishop of Chester, but only gave up Hunton when appointed to the see of London. Bishop Porteus died 13th May 1809. He was a sound Churchman, yet moderate, a great enemy of profanity and Sunday concerts, and a warm advocate of the West Indian slaves. He was a judicious observer of the times, as in his prudently delayed commendation of Sunday-schools. His learning was considerable, and the popularity of his Lectures on St Matthew's Gospel, and especially his Summary of Christion Evidences, was solely due to his being better known to him 'Protons,' and Parr described him as 'a poor paltry prelate, proud of petty popularity, and perpetually preaching to petticoats.'

See the Panegyric, rather than Life, by the Rev. Robert Hodgson (1811), editor of his works in 6 vols.: and a very full account in 1871. See also 1783-85.

Port Famine, the name given by Cavendish in 1587 to a spot in Patagonia on the north coast of the Straits of Magellan. From 1843 to 1853 it was a Chilian penal colony.

Port-Glasgow, a town of Renfrewshire, on the southern shore of the Firth of Clyde, 3 miles ESE. of Greenock and 20 WNW. of Glasgow. It was founded in 1668 by the magistrates of Glasgow as a harbour for their city, the deepening of the Clyde (q.v.) not having yet been thought of. In 1710 it was constituted the head custom-house on the Clyde, and for a while took the lead of Greenock; in 1776 it was incorporated as a municipality; and by the Reform Bill of 1832 it was raised to the rank of a parliamentary borough, uniting with Kilmarnock, &c. to return one member. Built on low alluvial ground, and backed by hills 700 feet high, it has a Doric town-house (1813), a public hall (1874), ruined Newark Castle (1897), a wet- dock of 12 acres (formed since 1854), a large graving-dock (1874), extensive timber-ports, ship-building-yards, iron and brass foundries, &c. Pop. (1841) 6938; (1851) 10,802; (1891) 14,685.

Port Hamilton, a spacious, well-sheltered harbour, formed by three islands of the Nan-han group, 30 miles S. of Corea and 45 NE. of Kejiap (q.v.). It was annexed by Britain as a prospective coaling station in 1885, but abandoned in the following year. It was discovered and named by Belechy in 1845.

Port Hope, a port of entry of Ontario, on the north shore of Lake Ontario, 63 miles by rail E. of Toronto. It has a good harbour, and a trade in lumber and grain, and in the town woollens, buttone, and iron castings are manufactured. Pop. (1881) 5581; (1891) 5042.

Port Huron, capital of St Clair county, Michigan, is on the St Clair River where it issues from Lake Huron, and at the mouth of the Black River, 59 miles by rail NNE. of Detroit. The rivers are crossed by four iron bridges. The city has a fine custom-house (1857), shipyards and dry-docks, sawmills, grain-elevators, and machine and railroad shops. Much pine timber is brought down by the Black River. A railway tunnel passing under the St Clair River connects the town with Sarnia, in Canada (see St CLAIR); there is also a steamer to Sarnia, and steamboats ply daily, except in winter, between Port Huron and Detroit. Pop. (1880) 8883; (1900) 19,158.

Portici, a town on Italy, on the slope of Vesuvius, 5 miles by rail SE. of Naples. Its environs are delightful, and are dotted over with country-houses. The royal palace built (1738) by Charles III. containing 166 rooms, is an agricultural town. There are a small fort, fishing, and sea-bathing. Silkworms are reared and ribbons made. Pop. 12,272.

Port Jervis, a village of New York, on the Delaware River, 88 miles by rail NW. of New York City. It contains railway shops, planing and other mills, glass-works, and manufactories of boots and shoes, glues, and watch-case materials. Pop. (1880) 9657; (1890) 10, 820.

Portland, (1) the largest city and chief seaport of Maine, and capital of Cumberland county, on Casco Bay, 108 miles by rail NE. of Boston. It is situated on a narrow peninsula, embracing 25 sq. m., with broad shaded streets, and handsome public and private edifices. It abounds in custom-houses, post-office, city hall, observatory, and Baxter and Mechanics' Halls. There are rolling-mills, and locomotives, machinery, boilers, stoves, carriages, and shoes manufactured, and sugar and petroleum refined. The harbour, which is deflected by three forts, is large, deep, and well sheltered; there are wharves, elaborate dry-docks, and an important trade is carried on; steamers ply direct to Liverpool in winter. The place was first settled by an English colony in 1632.
PORTLAND

In 1866 a fire destroyed $10,000,000 worth of property. Portland is the seat of Episcopal and Roman Catholic bishops, and was the birthplace of Longfellow. Pop. (1890) 30,423; (1900) 30,145.

(2) PORTLAND, the metropolis of Oregon, and capital of the State, is located on the Willamette River, 12 miles from where it joins the Columbia (about 100 from the ocean) and 772 by rail N. of San Francisco. It has railway communication with St. Paul and Council Bluffs also, and is a port of call for many of the large ocean-going ships coming up to this point. A handsome city, well built, with fine shaded streets, it has a court-house, a United States government building, numerous churches and schools, and an asylum for the insane. There are iron-foundries, machine-shops, sawmills, canneries, breweries, and manufactories of furniture, flour, shoes, &c. Clearing-house returns show $95,000,000 for 1890—exports, $12,000,000. Portland was founded in 1844, and became a city in 1851. Pop. (1870) 8283; (1880) 17,577; (1890) 46,388; (1900) 90,426.

Portland, Dukes of. See Bentinck.

Portland. Isle of, a rocky peninsula of Dorsetshire, connected with the mainland by the Chesil Bank (q.v.), and 4 miles S. of Weymouth by a boating-lift (1855). It is 4½ miles long, 1½ wide, 9 in circumference, and 2890 acres in area. From its highest point, the Verne (495 feet), it shelves with a gradual and almost unbroken slope to Portland bill (20 feet), the southern extremity, where stand two lighthouses (1716–89), showing fixed lights 210 and 13 miles, sea-level, and being well lighted and the Shambles, a dangerous reef, 3 miles south-east, a surf, called the Portland Race, is raised by the rushing of the impetuous tides. The cliffs have in places been worn into fantastic caverns; and ancient raised beaches are well marked near the bill. Portland is of one solid mass of oolitic limestone, which has been largely quarried for building purposes since the 17th century, when Inigo Jones employed it for Whitehall and Sir Christopher Wren for St. Paul's. Goldsmiths' Hall, the Reform Club, and Pall Mall generally are also built of it; and the yearly export now ranges between 50,000 and 70,000 tons.

There are three different qualities of Portland stone, the three strata lying close together. The top bed, called Roach, is unsuited for fine linen weights of itself, but it is hard and durable, and does well for building of dock foundations, and the like. The White Bed, which comes next, yields the best stone for fine buildings. It varies in texture from a fine close grain to the roe-like structure characteristic of oolitic limestone, and is free from shells. Its colour is a pleasing grayish white. The Base Bed, not quite so much quarried as the others, is of finer grain and whiter than the White bed; but it is softer and better suited for internal than external architectural work. An analysis of this stone by Professor Daniel showed the following composition: Silica, 1½; carbonate of lime, 9½; carbonate of magnesia, 1½; iron and alumina, ½; water and loss, 1½; besides which ingredients there is often a trace of bitumen present. Portland stone is also quarried in the 'Isle' of Purbeck and the Vale of Wardour.

The formation of a magnificent harbour of refuge has been described at Breakwater, where also a map is given; most formidable fortifications have moreover been constructed, the Verne in especial being crowned by Fort Victoria. Other vestiges of the 'Isle' are its great convict-prison, dating from 1848, and holding upwards of 1500 convicts (see PRISONS); Portland Castle (1590), built by Henry VIII., and held for Charles I. till 1646; Bow and Arrow Castle, ascribed to Rufus; and Pennsylvania Castle (1806), built by Governor Penn, the great Quaker's grandson. The inhabitants of the 'Isle' long remained a peculiar people, intermarrying, and preserving generation after generation, the many curious eccentricities of the forefathers. The 'Isle' itself is remarkable for its copious and excellent spring-water and for its small breed of black-faced sheep, whose flesh, well known as 'Portland nutton,' is much esteemed for its flavour. Pop. (1851) 3195; (1861) 10,661; (1891) 11,000.

See Damon's Geology of Weymouth and Portland (1860), and an article in the Cornhill (1882).

Portland Beds. See JURASSIC SYSTEM.

Portland Cement. See CEMENT.

Portland Sago. See ARUM.

Portland Vase, a celebrated ancient Roman glass vase or cinerary urn found during the pontificate of Urban VIII. (1623–44) in a niarable sarcophagus (of Alexander Severus, it is thought, and his mother Mammeia) in the Monte del Grano, near Rome. It was at first deposited in the Barberini Palace at Rome, and hence it is sometimes called the Barberini Vase. It was bought in 1770 by Sir William Hamilton (q.v.), and in 1787 by the Portland family, who in 1810 deposited it in the British Museum, where it is now shown in the Glass-Case. The ground of the Portland Vase is of dark-blue glass, and the figures—subjects which adorn it—are cut in cameo style in an outer layer of opaque white glass. In the official British Museum Guide (1890) it is stated that the composition is supposed to represent on the obverse Thetis consenting to be the bride of Peleus, in the presence of Poseidon and Eros; on the reverse of Neptune and Thetis on Mount Pelion. On the bottom of the vase is a bust of Paris. The vase was broken to pieces by a lunatic in 1845, but the fragments were very skilfully united again. The Portland Vase is 10 inches high, and is the finest specimen of an ancient cameo cut-glass vase known. There are only two others of similar character which approach it in beauty—viz. an amphora in the Naples Museum and the Auldio Vase. But fragments of the same kind of glass exist with work upon them quite as fine. In the end of the 18th century Josiah Wedgwood, the famous potter, made fifty copies in fine earthenware of the Portland Vase, which were originally sold at twenty-five guineas each. One of these now fetches £200.

Port Louis, the capital and principal port of the British colony of Mauritius, is situated on an excellent harbour on the northwest coast, and is enclosed by a ring of lofty hills. It is defended by barracks and military storehouses. There are three graving-docks beside the harbour, through which all the commerce of Mauritius (q.v.) passes. The dockage has been considerably improved of late. The city contains the government house, a Protestant and a Roman Catholic cathedral, a royal college, &c. Pop. (1889) 61,170.

Port Mahon (anc. Portus Magonis), the capital of the island of Minorca (q.v.), is beauti-
fully situated on a deep, narrow inlet in the south-east of the island. Its harbour is one of the finest in the British Empire, and is fortified by powerful forts and fortifications. Building stone, shoes, cottons, cattle, and honey are exported. Pop. 13,842. The town was held by the English from 1708 to 1756, and again from 1762 to 1782. It was they who made it a first-class fortress.

**Port Moody.** See VASCANTO.

**Porto Alegre**, capital of the Brazilian state of Rio Grande do Sul, stands at the north-west extremity of the Lagoa dos Patos, by means of which it communicates with the sea. It was founded in 1742, is well built, and has about 35,000 inhabitants. It contains a cathedral, an arsenal, military and normal schools, and a local seminary, and a German club. Most of the wholesale trade is in the hands of the Germans, who number some 3000. Railways bring the produce of the interior down to the port, which, however, can only be entered by ships drawing 8 feet. There are manufactories of pianos, furniture, brandy, and beer.

**Portobello**, a Scottish watering-place on the south coast within the River Forth, 3 miles E. of Edinburgh. Its first house (1742) was built by one of Admiral Vernon's seamen in the expedition against Porto Bello, and hence it derived its name; but it dates, by its extensive extension Jopp, almost wholly from a time later than 1800. An esplanade, 8 mile long, skirts the broad level sands; and there are a promenade pier of 1250 feet (1871), municipal buildings (1878), half-a-dozen churches, and manufactories of pottery, bricks, bottles, &c. **Portobello**, with Leith and Musselburgh, returns one member to parliament. Pop. (1854) 5939; (1891) 8892. By the Edinburgh Extension Act (1896) Portobello was incorporated with Edinburgh.

**Portobelo**, formerly PUERTO BELLO, a decayed seaport of Colombia, on the northern shore of the Isthmus of Panama. It has an excellent harbour, discovered by Columbus in 1502, but has fallen into decay since 1729, when it was stormed by Admiral Vernon. Pop. 1300.

**Porto Ferrao.** See ELBA.

**Porto-Maurizio**, a town of North Italy, stands overshadowed in olive-groves on the Gulf of Genoa, by rail 69 miles SW. of Genoa and 41 E. by N. of Nice, and consists of an old town on the right bank of a shallow river, with a small harbour. Pop. 6500.—The promontory has an area of 468 sq. m. and a pop. of 145,818.

**Porto Novo**, a small port on the Comorand coast of India, 145 miles S. of Maclas by rail. Both the Danes and the Dutch had formerly a factory here. The place is celebrated for the battle fought here on 1st July 1751, when Sir Eyre Coote, with 3000 men, defeated Hyder Ali and an army of 60,000. From 1824 on for some years there was an iron-foundry here, the ore being brought from Salem. Pop. 7823.

**Porto Rico**, or PUERTO RICO, a West India island (Spanish till 1898), lies 75 miles E. of Hayti or St Domingo. An oblong in shape, it has an area of 3390 sq. m., about five-sixths the area of Jamaica, and measures 110 miles east to west, and 40 from north to south. It is traversed from east to west by ranges of mountains, 1500 feet in average height, though Mount El Yunque rises to 3670 feet. From the base of the mountains rich alluvial tracts extend to the sea on all sides, and are watered by innumerable short streams. The higher parts are covered with forests. Rain falls in much greater abundance on the north than on the south of the island. The principal crops are sugar, coffee, and rice (the food of the people), though tobaco, maize, yams, bananas, plantains, and tropical fruits are also raised. Large herds of cattle and horses are fed on the lowland pastures. Gold, copper, iron, lead, and coal have been found, but the industries of Porto Rico are entirely agricultural. The imports consist of cotton and woollen goods, metals, hardware, machinery, minerals and animal products, and provisions, such as rice, flour, ale, fruits, &c., to a total value in 1897 of about $10,715,000; the exports are coffee, sugar, molasses, tobacco, corn, cattle, &c., to a value of about $11,011,500, both import and export trade being chiefly with Spain, the United States, Great Britain, and Germany. The population increased from 135,400 in 1890 to 153,248 in 1898, 363,817 being coloured. Chief towns are San Juan, the capital, Ponce, and Mayaguens. Porto Rico was discovered by Columbus in 1493; Ponce de Leon founded a settlement in 1510. It was loyal and obedient to Spain, notwithstanding an attempted uprising fostered by Colombians in 1825. Occupied by United States troops during the war with Spain (1898), it was ceded to the United States by the peace treaty. An act of congress conferred civil government on the island in 1900.

**Portpatrick**, a decayed fishing-village in Wigtonshire, 10 miles SW. of Stranraer by rail. It is sheltered by high cliffs, and has a pleasant south-westerly exposure, but the coast is rocky and the sea boisterous, while there are no facilities for bathing, although the village enjoys some reputation as a watering-place. Portpatrick is but 214 miles direct north-east of Donaghcloney in County Down, was long the Greta Green for Ireland, and the chief place for the importation into Scotland of Irish cattle and horses, while it was a mail-packet station from 1682 till 1849. A pier was built in 1774, and a great artificial harbour was commenced from Rennie's designs in 1821, but ultimately was found impracticable as a place of shelter owing to the violence of the south-westerly swell and the winds that blow for eight months of the year. The public confidence in the harbour received its death-blow from the wreck of the Orton steamship within the port in 1856, when about seventy souls perished within a few yards of the crowded street. The lighthouse was removed in 1869, and the harbour-works fell quickly into hopeless ruin, after having cost the country £500,000. Pop. of parish 1932, 5299; (1891) 2974.

**Port Phillip**, the gate of Melbourne, dis covered in 1802 by Lieutenant Murray, and named in honour of Captain Phillip, the first governor of New South Wales (q.v.). Victoria itself was originally called the district of Port Phillip.

**Portraits.** Composite, a method of indicating the facial characteristics of a family or group of persons, while at the same time suppressing the peculiarities of individual members. Mr Francis Galton has thus prepared type faces each composed of a number of individuals specially celebrated for some particular branch of art, science, or occupation. The results are recognised as of considerable value to the student of anthropology.

One of the best ways which landscape photographers may adopt is to take full-face photographs of each person composing the group, of such a uniform size that two fixed horizontal lines pass, one through the inner angle of the eyes, the other through the line dividing the lips, while a third fixed perpendicular line equally divides the nose; by this means the photographs are brought approximately to the same size, and corresponding portions of the various faces occupy similar positions. Now suppose there are ten individuals in the group, and that any one negative would require half an hour to produce a good print, then each negative is printed for one-tenth of half
THE SEA-WALL AT SAN JUAN, PORTO RICO.
an hour, and is carefully adjusted so that each succeeding negative occupies the same position on the print as the preceding one; thus a composite portrait will result, each of the ten likenesses having an equal share in its production. Where any characteristic is common to all or several, that peculiarity will be pronounced; where, however, only one or two persons possess the peculiarity, it is more or less tacitly connected with the others, to such an extent that it is visible to the eye of the beholder. By taking a negative of a succession of positives a composite negative will result capable of indefinite reproduction. The result is often a highly idealised portrait representative of the family, the post, state, town, mathematician, golfer, and, &c., and types of the group it represents.

Portree. See SKYE.

Portreeve, once the English name of the principal magistrate in a port town, especially in London (q.v.).

Port Royal. See JAMAICA.

Port-Royal des Champs, a convent of Cistercian nuns, nearly 3 miles SW. of Versailles, which obtained much celebrity during the 17th century. It was built by a monk of the foundation of Montmorency in the early part of the 13th century, and soon after its establishment obtained from the pope the privilege of receiving lay persons, who, without taking monastic vows, desired to live in religious retirement. The discipline of the convent has been described as the most austere of all the French religious houses during the 13th and 14th centuries, one of its worst abuses—that of appointing the superior, not on account of fitness, but from considerations of family or other worldly or political motives—became in the end the occasion of its complete reformation under Marie Anglique Arnauld, the Olympe de Gouges (18th c.). The convent was removed from Paris in 1626, and in 1633 to a new convent, Port-Royal de Paris; and from this time the old establishment of Port-Royal des Champs was exclusively devoted to the use of a lay community. This community soon numbered among its permanent inmates some of the most distinguished scholars of that age, Antony Arnauld, Le Maistre, Anthony and Louis Isaac le Maistre de Sacy, Nicole, Lancelot, Scricourt, and others. Their rule of life was most austere, rising at 3 A.M., devoting much of the morning and afternoon to reading and instruction, and a portion of the day to manual labour. One of their public services was the establishment of a school, for which they prepared well-known educational books, the Port-Royal Greek and Latin Grammars, General Grammar, General Arithmetic (1669), and Scholastic Logic (1673), new ed. by Professor Spencer Baynes, 1881), &c. But Port-Royal is best known for its adherence to the Jansenist movement (see Jansen). The nuns of Port-Royal having refused to subscribe the formulary condemning the Five Propositions, a royal order was issued in 1660 for the suppression of the school and the removal of the boarders of Port-Royal des Champs; and the abbees and several other nuns were arrested, and confined as prisoners in other monasteries. After the 'Peace of Clement IX.' they were permitted to return; but the two communities were placed under a separate government. When the final steps for the repression of the Jansenist party were taken about 1707 a formal bull was issued by Pope Clement XI. for the suppression of Port-Royal des Champs, and the transfer of its property to Port-Royal de Paris. The nuns were finally dispersed and distributed over convents of different orders throughout France. The property of the convent and church was transferred to the Paris house, and all the buildings of Port-Royal des Champs were levelled to the ground by order of the king. See Sainte-Beuve, Port-Royal (4th ed. 6 vols. 1878); Charles Beard, Port-Royal (2 vols. 1861).

Portrush, a watering place in County Antrim, 63 miles by rail N. of Coleraine, and 7 W. by S. of the Giants' Causeway, with which it is connected by an electric tramway (1883). The town is built on the isthmus of a short peninsula, looking to the Causeway cliffs on the one side, and to Inishowen and almost Malin Head on the other. It has fine sands and cliffs suitable for bathing, and has communications by steamer with Morecambe and Glasgow. Pop. 1322.

Port Said, a town of Egypt, on the west side of the Suez Canal, on a desolate strip of land between Lake Menzaleh and the Mediterranean. The place owes its origin to the Suez Canal (q.v.), being named after Said Pasha, its promoter, who, it is believed, drew up the plans and engaged the workmen. The town depends wholly on the canal trade, being mainly a coaling station for steamers. Pop. (1882) 16,560.

Portsea Island, a small island on the south coast of Hampshire, has on its west side Portsmouth Harbour and on its east side Langstone Harbour, and is separated from the mainland on the north by the Hayling bill and the Langstone bridges. It is four miles long by from two to three broad, and contains the towns of Portsea and Portsmouth.

Portsmouth, the chief naval arsenal of Great Britain, and an important seaport, market-town, and municipal, parliamentary, and county borough, in the south of Hampshire, stands on the southwest coast of England and is connected by rail to Portsmouth Harbour, and opposite the town of Gosport (q.v.), with which it communicates by means of a steam-bridge. It is 74 miles SW. of London, 44 W. of Brighton, and 23 SW. of Southampton. Besides the parish of Portsmouth, the limits of the town include: 1st, the Hayling bill, a strip of land which are co-extensive, include also the parish and town of Portsea, and the out-wards Landport and Southsea, and comprise the whole of Portsea Island, with the exception of a small portion in the northeast corner. Pop. of the borough (1821) 29,475; (1851) 79,996; (1871) 133,569; (1881) 197,869; (1891) 159,255. Portsmouth is for the most part a mean-looking, dirty town, but has the most complete fortifications in Britain. These comprise, on the landward side, the outer line of the Ports- mouth town forts and the Hilsen lines; to seaward, the Spithead (q.v.) forts. A portion of the bastioned ramparts, which formerly encircled both Portsmouth and Gosport, and were so imposing in appearance, have since 1872 been removed as useless. Southsea, which is situated outside the walls of Portsmouth, is a fashionable watering-place. In the town proper there are few objects of note. Pleasing views may be had from the ramparts and batteries of the harbour, the roadstead of Spithead, and the Isle of Wight. Many improvements have been carried out in Portsmouth, including improved drainage, and the opening of the Victoria Park in 1878; also a new town-hall has been built at a cost of £140,000, which was opened by the Prince of Wales in 1890. Among the few notable buildings may be mentioned the church of St Thomas, whose chancel and transept were restored from close of the 12th century, the nave and tower from 1898, and which contains a ghastrly cenotaph in memory of the murdered Duke of Buckingham. The Garrison Chapel, Early English style, and fine resting place, stands near the hospital of St Nicholas, founded in 1212 by Bishop Peter de Repibus. In it Charles II. married Catharine of Braganza; and in front of it is buried the brave Sir Charles James Napier (q.v.), who died in this neighbourhood in 1855. The dockyard of Portsmouth, in the district of Old Portsmouth, was till 1872 only 116 acres in extent; but vast
works have since then been carried out at a cost of £2,500,000, which have increased the area to a total of 233 acres. Of this immense naval establishment the most noteworthy, if not the most recent, features are the mast and rope houses, hemp-stores, rigging-stores, sail-lofts, and the dry-docks, spacious enough to admit the largest vessels, and offering every facility for their speedy repair. The twelve docks, 22 to 36 feet deep, are lined with solid masonry, roofed over, and closed by lock-gates. Of the various building-slips, one of them, roofed and covered in, is so large that three or four vessels can be in process of construction under it at the same time. The Wool Mills contain a number of most ingenious block-making machines, the invention of Sir Isambard Brunel (q.v.), in which rough timber, introduced at one end, is cut, squared, drilled, bored, and turned into the required shape. About 150,000 blocks are made here annually, and the machines require the attendance of no more than four men. In the smithy anchors are forged by aid of a Nasmyth's hammer.

The dockyard also contains the residences of the superintendent officers, and a school of naval architecture.

Portsmouth Harbour, about 400 yards wide at its entrance, expands into a spacious basin, extending inland for about 4 miles, and having a breadth of 3 miles along its northern shore. Large war-vessels can enter and lie at anchor at all times of the tide, there being 4 fathoms of water in the channel at low water. The outward entrance is defended by Ports Moumoreon and Gilkieker, and Southsea Castle. The position of this harbour is highly favourable. It is situated in the middle of the channel, close to the magnificent anchorage of Spithead, where 1000 ships of the line may ride without inconvenience, and is under shelter of the Isle of Wight, and opposite the French arsenal of Cherbourg.

The local trade of Portsmouth is chiefly supplied by the dockyard and other public establishments. Brewing is largely carried on. Grains, potatoes, corn, and timber are imported from British coasts, and potatoes, granite, corn, timber, cattle, and wine from abroad. The only exports are pottery (shipped at Fareham) and coal-tar pitch.

The importance of this port dates only from the reign of Henry VIII. Its defences were commenced by Edward IV. and strengthened by Elizabeth, and afterwards strengthened and made more thorough by Master and Sir William III. Here, in a house that still remains in the High Street, and which was then an inn called the 'Spotted Dog,' the Duke of Buckingham (the 'Steenie' of King James) was assassinated by John Felton. On the 29th of August 1792, when its commander, Admiral John King, was lying in his cabin, the Royal George went down at Spithead, and nearly 1000 lives were lost. Charles Dickens was born at 387 Mile End Terrace, Commercial Road, Portsea; and other worthies of Portsmouth have been Walter Besant, the younger Brunel, Jonas Hanway, Sir Frederick Madden, George Meredith, and John Pounds.

See L. Allen's History of Portsmouth (1817), II. Slight's Chronicles of Portsmouth (1828), H. P. Wright's Story of the 'Doune Del' or Garrison Church (1873), W. H. Saunders' Annals of Portsmouth (1888), and Murrell and East's Extracts from Portsmouth Records (1884).

Portsmouth, (1) the metropolis and only seaport of New Hampshire, is on the south bank of the Piscataqua River, which flows from the Atlantic, and 57 miles by rail NNE. of Boston. Built on a beautiful peninsula, overlooking a capacious and deep harbour, with smooth rock bottom, it is a handsome old town, many of its streets lined with sable trees, and is a favourite summer-resort. It has a custom-house, and some shipbuilding is still carried on; the manufactures include cotton, hosiery, shoes, tin-castings, and beer. At Kittery, on an island opposite, is a United States navy-yard, with large ship-houses and a floating balance-dock, 350 feet long by 105 wide, with twenty-four pumps. Portsmouth was settled in 1623, and was capital of the state till 1807. Pop. (1900) 10,637.—(2) Capital of Scioto county, Ohio, stands among hills in an iron region, on the Ohio River, at the mouth of the Scioto, and at the southern minis of the Ohio Canal, 106 miles by rail ESE. of Cincinnati. It has several iron-foundries, rolling-mills, stone-mills, and sawmills, and manufactures stoves, nails, steel springs, furniture, machinery, boots, &c. Pop. (1900) 17,570.—(3) A city and port of Virginia, on the Elizabeth River, opposite Norfolk. Gosport, with its navy-yard, &c. (see Norfolk), is a suburb. Portsmouth contains a dry-dock and a naval hospital, and exports naval stores, iron, lumber, cotton, and early vegetables for the north. Formerly a part of Albemarle county, it is now independent. Pop. (1900) 17,427.

Portsmouth, DUCHESS OF. See CHARLES II.

Port Townsend, capital of Jefferson county, Washington, is on Puget Sound, near Juan de Fuca Strait, 42 miles NNW. of Seattle. It has a good harbour, and is an important United States customs station; it is of great strategic importance, and is well fortified. The industries include shops, foundries, &c. Pop. (1900) 3434.

Portugal, a kingdom of Europe, on the west side of the Iberian Peninsula, stretches 350 miles between 36° 59' and 42° 8' N. lat., and varies in width from 70 to 140 miles between 6° 10' and 9° 31' W. long. Its eastern and northern boundaries are Spain, its western and southern the Atlantic
Ocean. Details of provincial areas and populations are given in the subjoined table.

The population increases steadily but slowly: in 1851 it numbered 3,487,000; in 1874, 4,160,315; and in 1881, 4,708,178. But fully 16,500 persons emigrate every year, the majority going to America, chiefly to Brazil.

**Physical Aspects.** In respect of its physical structure and conformation, Portugal forms an integral part of the Iberian Peninsula (see Spain). The coast is low and flat, and sandy, except for one or two short distances, as immediately north and south of the mouth of the Tagus, at Cape St. Vincent in the extreme south-west. The two northern provinces are diversified by spurs (5000 feet) of the mountains of Spanish Galicia. The most important mountain-range of Portugal is the Sierra da Estrela (6540 feet), a westward continuation of the Sierra Guadarrama system. The Sierra Morena is continued westwards in southern Portugal. In like manner, the principal rivers of the country—the Guadiana in the south, the Tagus in the centre, and the Douro and Minho in the north—are simply the lower courses of what are geographically Spaniard rivers. The Mondego, which reaches the sea about half-way between the Tagus mouth and that of the Douro, is the longest river that has its sources in the country. Portugal has numerous mineral springs, a large proportion being impregnated with sulphur. Minerals exist in fairly rich abundance, but are not worked to the extent they could be, chiefly from want of fuel and cheap means of transit. Salt is prepared in large quantities in the salt marshes; copper, iron, lead, manganese, antimony, gypsum, lime, and marble are extractable and in part exported. About 5000 persons are all engaged in mining, the yield of which reaches the total value of £224,000 per annum.

**Climate.** The vicinity to the ocean tempers the climate of Portugal, and exempts it from the dry heat of the interior. When viewed from the surface, however, diversities of climate; for, while snow falls abundantly on the mountains in the northern provinces, it is never seen in the lowlands of the southern districts, where spring begins with the new year and harvest is over by midsummer. Rain falls abundantly all the year round, especially on the coast, and from October to March. As a general rule, the climate is healthy in the elevated districts, even of the southern provinces; but malaria and fever prevail in the low flat lands and near the salt marshes. The mean temperature ranges from 60° F. at Oporto to 63° 5 at Lagos on the south coast.

The animal life and plant life do not differ from those of Spain (q.v.).

**Occupations.** The soil is generally rich, except in the arid parts; but agriculture is every- where in a backward state, having more than an half of the area of the country being put to profitable use. Arable land occupies only 51½ per cent.; grass-land, 24 per cent.; orchards, 7 per cent.; forest, 3 per cent.; vineyards, 2½; and olive-groves, about the same. The principal crops are: maize, wheat, rye, barley, and rice, but not in sufficient quantity for the wants of the people. Potatoes, vegetables (especially onions), flax, fruits (oranges, lemons, chestnuts, almonds, &c.) are grown in large quantities. But the cultivation of the vine and of the olive are the most prosperous branches of industry; from the former is derived the rich red wine familiarly known as Port, from the latter the magnificent olive oil of the port. The total quantity of wine annually produced in Portugal amounts to 88,000,000 gallons. Cattle are reared in the north, sheep and goats in the centre, and swine in the oak forests of the south. In the vine districts of the north and centre the hay is mostly exported to London and English proriers; in other parts of the country great estates are owned by the nobles and let to tenants to cultivate. The rearing of silkworms and the keeping of bees is pursued with some energy. Fish is abundant in all the rivers and off the coasts. Tunny and sardines are exported; and late attention has been given to the rearing of oysters.

**Commerce.**—Portugal is not a manufacturing country; what industry there is is principally concentrated in the two chief towns, Lisbon and Oporto. In all, some 91,000 persons are engaged in industrial pursuits, and of these nearly a quarter are employed in weaving wool. The rest cut cork, manufacture cotton, linen, silk, leather, glass and porcelain, paper, and gold and silver filigree, and carry on various other industries. In 1889 the imports amounted in value to £1,200,000, of which the principal items were iron and steel vessels (43 steam), measuring in all 77,996 tons. During the four years ending 1887 the Portuguese ports were entered by an average of 5565 ocean-going vessels of 3,404,500 tons, but in 1893 by 5,793,000 tons of these, nearly half in number and more than half in tonnage were British. In 1893, 1430 miles of railway were open, and 300 more in course of construction. The exports, consisting principally of wine, copper, salt, cork, fish, oxen, fruits, vegetables, and wool, average 4½ millions sterling in value annually. More than one-half of this total is for wine, the value of which ranging between £1,580,200 (in 1879) and £2,751,770 (in 1886). Of this again the greater part is for port wine, exported to Britain, 3 to 4 million gallons annually, valued at 1 to 1½ million sterling; and to Brazil, to an annual average of £268,000. France takes every year about 400,000 cases of wine, the common wine of the country. The value of all the exports sent to Great Britain every year ranges from 2½ to nearly 4 millions sterling. Apart from wine, the principal items are cork, copper, salt, wool, and five other imports. Portugal's imports chiefly cottons (1½ to 2 million sterling), woollens, coal, metals, machinery, and butter, to the annual value of 1½ to 2½ millions sterling. Her total imports, which, in addition to the articles mentioned, embrace bullion, flour and wheat (more than £1,000,000 annually), glass, live-stock, silk, timber, linen, &c., reached the value of 11½ millions in 1889, a steady increase from 7½ millions in 1885. Germany, France, and the United States rank next after Great Britain as sources whence Portugal draws her imports.

**Finance.**—Many of her commercial prosperity, Portugal cuts a bad figure in her financial arrangements. For years there has been an annual deficit, which is mostly met by loans, so that the national debt is rapidly increasing. Whereas in 1878 the national income was £3,973,000, the expenditure was £7,089,000, whereas in 1887 the income had increased to £8,468,000, but the expenditure was £16,000,000. The national debt has increased from £20,974,000 in 1856 to £64,333,000 in 1871, and £149,406,105 in 1892, besides £4,784,777 of floating debt. This interest for the country's loans is accordingly some £5,000,000, by a long way the heaviest item in the national expenditure.

**Defence.**—Every Portuguese above twenty-one
years of age is liable for service in the army. Twelve years is the period of service, three years with the colours and nine in the reserve. On the footnote the army embraces in all about 33,000 800,000; of whom about 150,000 men of all arms. The fleet consists of 1 Ironclad, 10 corvettes and screw-steamers, 21 gunboats and transports, 5 torpedo boats, 13 sailing-vessels, and 7 training and coast-guard ships, the whole manned by 250 sailors and 250 officers.

Religion. Education. — The state religion is that of the Church of Rome, but toleration is extended to all other creeds. There are three ecclesiastical provinces presided over by the Cardinal Patriarch of Lisbon, the Archbishop of Braga, who is primate of the kingdom, and the Archbishop of Evora; these dignitaries rule over fourteen bishops. Ten monasteries were dissolved in 1834, their properties, yielding about one million sterling annually, being appropriated by the state. Education is superintended by a council, at the head of which is the minister of the interior, and is entirely free from the supervision and control of the church. Compulsory education was enacted in 1844, but is far from being fully enforced, consequently Portugal lags behind in education and general intelligence. There are nearly 4000 elementary schools, with about 900 schools for girls, and numerous private schools; polytechnic academies at Lisbon and Oporto; and clerical, medical, agricultural, naval, and military training-schools. The one university at Coimbra (1530), one of the oldest in Europe, has five faculties, 75 professors, and about 900 students. Schools for training in the industrial arts are in great favour; there are 28 in the country, headed by larger institutes at Lisbon and Oporto. Lisbon has a learned society (the Academy of Sciences), and a public library (1766) of 260,000 volumes. There are other libraries at Coimbra (1581) with 14,000 vols., and at Oporto (1833), with 100,000 vols.

Constitution. — Portugal is a constitutional monarchy, the crown being hereditary alike in the female and the male line. The parliament, or Cortes, consists of the House of Peers and the House of Deputies, the former of 350 members, when the necessary changes have been made, eventually consist of one hundred life members elected by the king and fifty elected indirectly, five by the university and scientific societies and forty-five by popular electors. The House of Deputies consists of two chambers, one for every forty citizens above twenty-one years of age who possess certain qualifications of property or status. Parliament is elected every four years; sessions last three months in the year. The deputies are paid 1 l. a day. The executive is wielded by a cabinet of seven ministers, chosen by the premier (one of the seven), who himself is selected by the king. The departments are Interior, Justice, Public Works, Finance, Marine and Colonies, War, and Foreign Affairs. The sovereign also consults a council of state of more than sixteen members, nominated for life, and generally including ex-ministers and present ministers. Justice is administered by rural magistrates in 146 district courts, in 3 courts of appeal (at Oporto, Lisbon, and Azores), and in the supreme tribunal of the kingdom at Lisbon.

Portugal. The Portuguese are a mixed race, originally Iberian, Basque, and Celtic admixture. Galician blood (derived from the ancient Gallici, presumably Gallic invaders) predominates in the north; Jewish and Arabic blood are strongly present in the centre, and Arabic in the south. The Portuguese differ essentially from their Spanish brethren, but regard with inveterate hatred and jealousy, mainly on account of their past attempts to subvert the independence of Portugal. The opinions of observers differ as to the national traits of the people. They seem, however, to be generally sober, good-natured, obliging, and patriotic, but shiftless and dirty. The women are usually exceeding 100,000; no other town reaches 30,000. Lisbon is the capital, Oporto the centre of the port-wine trade, and the chief town of northern Portugal.

The colonial possessions of Portugal are enumerated in the subjoined list:

See Crawford, Portugal, Old and New (1850); and Round the Calendar in Portugal (1890); Aldama-Ayala's Compendio; Murray's Handbook; G. B. Loring, A Year in Portugal; and pullman, Journals of a Residence in Portugal (1895); and Maccabees, As Colonies Portugueses (1897).

History. — Romans followed Carthaginians as conquerors (138 B.C.) of the western Iberians and Celts. Under Augustus the peninsula was divided into three provinces, one of which, Lusitania, has, until quite recent times, been regarded as nearly identical with the present kingdom of Portugal; but the Augustan province of Lusitania lay wholly on the south side of the Tagus. The history of Portugal was in early times coincident with that of the Iberian as a whole; and, along with the rest of the peninsula, Portugal was thoroughly Romanised in the days of the empire. After the Romans withdrew, the peninsula was overrun by Visigoths from the north, and at a later period by Saracens from the south. Under Roman, Visigothic, and Saracenic rule, the independent provinces were prosperous and well governed, but became enervated by luxury and unwarlike ease. About the middle of the 11th century northern Portugal fell under the sway of Ferdinand I. of Castile. In 1094 Henry of Burgundy, who had married a natural daughter of Alphonso III., received from that monarch the county of Portugal (from the Minho to the Tagus) as a dependent fief. Under his widow, Theresa (1114-28) the country acquired a sense of national unity and a certain measure of independence. Their son, Alphonso I., made Portugal an independent kingdom (1143)—through the victory of a picked body of Portuguese knights over a picked body of Castilian knights in a tournament—and gained signal advantages over the Arabs, whom he fought for twenty-five years, his greatest exploits being the victory in the plain of Ourique, in Alentejo, in 1139, the capture (with the help of English crusaders) of Lisbon in 1147, and of Alcacer do Sal in 1158. The Burgundian House, which continued in possession of the throne for 440 years, gave to Portugal some of its best kings. Of Alphonso II. and Alphonso III. were engaged in incessant wars against the Moslems and in severe struggles with the clergy and nobles, who were always ready to combine against the sovereign; but, although often baffled in their attempts to uphold the independence of the crown, they maintained the whole, well maintained by the representatives of this family, who were, moreover, distinguished as
the promoters and champions of the maritime glory of Portugal. Sancho (died 1211), the ‘builder of cities,’ especially distinguished himself by his care for the material welfare of his kingdom, and by his encouragement of commerce and the arts. The fairs of Barcelos, Innocent the Third, and that pope’s supporters, the Portuguese bishops. His son, Alfonso II., summoned the first Portuguese Cortes. Alfonso III. (1248-79) conquered the southern province of the kingdom in 1250, and made Portugal what it practically is in area, at the body of its national character. (Deniz) must be regarded as the founder of Portuguese commerce and mercantile enterprise. He likewise encouraged agriculture and the industrial arts, and protected learning, in furtherance of which he founded in 1300 a university at Lisbon, subsequently transferred to Coimbra. Diniz was succeeded in 1325 by his son, Alfonso IV., surmounted the Brave, whose reign was almost wholly occupied in wars with the Castilians and the Moors (see CASTRO,INEZ DE). It was during his reign that the friendly commercial relations with England began. With Alfonso’s grandson, Ferdinand I., the legitimate branch of the Burgundian House became extinct in 1383. After some disturbances Ferdinand’s illegitimate brother, John, was recognised by the Cortes as king in 1383; four months later the able and brilliant John IV. won at Aljubarrota a glorious victory over the Castilians, who had invaded the country. John’s reign (he died in 1433) was eventful, not merely on account of the internal reforms which he introduced, and of his steady maintenance of the prerogatives of the crown, but also on account of the first of those important geographical discoveries and commercial enterprises which made Portugal for a while the greatest maritime power of Europe. During this reign, on May 9, 1386, the treaty of Windsor cemented the firm alliance and national friendship between Portugal and the English, a bond that was further confirmed by the marriage of King John to the daughter of John of Gaunt (1387). To John’s son, Henry the Navigator (died 1460), is due the merit of having organised several voyages of discovery, which culminated in the acquisition of the island of Lagos, and in the occupation of the Guinea and other islands. At this time, too, the slave-trade began, the Portuguese bringing captive negroes to cultivate the large estates of their southern provinces. During the reign of John II. (1481-98), who broke through the walls of Lisbon, Vasco da Gama, in the reign of John’s successor, Manoel, successfully achieved the passage by sea to India, in 1497. The discovery of Brazil (1600), and the settlements made there and on the western coast of India by Albuquerque (q.v.), increased the maritime power and fame of Portugal, which were further extended under Manoel’s son, John III., who ascended the throne in 1521.

At this period Portugal ranked as one of the most powerful monarchies in Europe, and Lisbon, the chief seat of the government of the East, as one of its most important commercial cities. Sudden as this prosperity had been, its decline was almost more abrupt, and may in a great measure be accounted for by the destruction of the old nobility, the extensive emigration that went on to the New World, and, in large measure, of the numerous wealthy and industrious Jews, on whose able financial management the commercial interests of the Portuguese were largely dependent, and the introduction of the Inquisition (1536), and of the Jesuits (1540), whose haughty supremacy gave rise to much tyranny and oppression, both in the colonies and at home, and in various ways stamped out the old spirit of the people, and crippled the resources of the nation. The influence of the Jesuits over John’s grandson, Sebastian (1557), was responsible for the defeat of the Portuguese, and the capture and death of their young king, at the battle of Alcuzar el-Kebir in Africa in 1578. And the influence of the Infanta Dona Leonor, Innocent the Third, and the brief reign of Sebastian’s uncle, Cardinal Henry, plunged the country into difficulties and misfortunes. After a struggle for the throne between half-a-dozen candidates, none of whom found favour with the nation at large—they clung to the delusive hope that Sebastian would rise from the dead—Portugal was freed from the hands of his Moorish captors—Philip II. of Spain succeeded in securing to himself the crown of Portugal and annexing the kingdom to the Spanish monarchy. This involved it in the ruinous wars of Spain against England, in the Low Countries, and in Germany, while the Dutch and English, in retaliation for Spanish aggressions at home, attacked and seized the Portuguese possessions in the Indian Archipelago and in South America. At length the insouciance of Philip IV.’s minister, Olivares, brought matters to a crisis; and in December 1640, after a forced union of sixty years, Portugal was freed, by a bold and successful rising of the nobles, from all connection with Spain, and the Duke of Braganza, a descendant of the old royal family, was placed on the throne (1641), under the guidance of John of Braganza, the King of Portugal, with Spain, which, however, was the natural result of this struggle, turned out under the guidance of the famous Count Schomberg (who fell at the battle of Almena, 1660), and with the assistance of 3000 English troops, favourable to Portugal, and was terminated in 1668 by the treaty of Lisbon, which, by which the independence of Portugal was formally recognised by the Spanish government. But her ancient glory had departed; she had lost many of her colonies, and of those she still retained Brazil alone was prosperous; the nation was steeped in ignorance and bigotry; and the Portuguese, from having been one of the greatest maritime powers of Europe became virtually a commercial dependent, rather than ally, of Great Britain, especially after the Methuen (q.v.) Treaty of 1703. Under the reign of Joseph I. (1750-77) the genius and resolution of the minister Pombal (q.v.) infused temporary vigour into the ailing nation, and arrested the downward tendency of the national credit. But Pombal’s efforts to rouse the people from their sloth, and infuse vigour into the government, were checked by the accession of Joseph’s daughter, Maria, who, with her uncle-husband, Pedro III., allowed themselves to turn back into their old course. The mental alienation of Maria led, in 1799, to the nomination of a regency under her eldest son, John. This prince, who showed considerable capacity in early life, on the outbreak of the war between Spain and France threw himself wholly on the protection of England; and finally, when he learned that Napoleon had determined on the destruction of his dynasty, left Portugal in 1807 and transferred the seat of government to Rio de Janeiro, the capital of Brazil (q.v.).

This act was followed by the occupation and annexation of Portugal by the French—a measure which gave rise to the Peninsula War (q.v.). The victory of Vimeira, gained by the combined English and Portuguese army in 1808, freed the land from its French assailants; and in 1816, on the death of the last Bourbon of Spain, it was ceded to the joint crowns of Portugal and Brazil. But even after the French were driven out of the Peninsula and Napoleon’s power was broken for ever, the new king, John VI., still continued to reside at Rio de Janeiro, and Portugal was governed by English officers, Marshal Bertrand, and thereafter.

This gave occasion to abuses and discontent, which resulted, in 1820, in a revolution at Lisbon, and in the proclamation of a constitutional form of
government, very democratic in spirit, in the place of the pre-existing feudal absoloulion. John hurried to Portugal, and there signed the constitution and ratified the charter of the Senate, whieh he had claimed his son Pedro emperor. On the death of John in 1826, Pedro IV., after organising the government of Portugal on the model of the English parliamentary system, renounced the Portuguese crown in favour of his daughter, Maria da Glória, a child of seven, on condition that she married her uncle, Miguel. The latter, who had availed himself of every opportunity to thwart the liberal policy of his father and brother, waited only for the embarkation of the English troops to break the oath which he had taken to maintain the constitution, and, gathering round him the clergy, the army officers, the old nobility, and all who were in favour of the former order of things, was through their aid declared king by the Cortes in June 1828.

Then ensued a period of indescribable confusion and misrule. At length, in 1832, Pedro was enabled, chiefly by means of a loan from Englishmen, to raise an army, and make a landing at Oporto. Charles Napier virtually destroyed Miguel's fleet off Cape St Vincent in 1833. Shortly afterwards Queen Maria made her entry into Lisbon, and the following year Miguel signed the Convention of Evora, by which he renounced all pretensions to the throne, and agreed to quit Portugal. The death of Pedro in the same year, after he had effected several important reforms, including the reintroduction of the constitution of 1826, proved a heavy misfortune to Portugal, which suffered severely from the mercenary rule of those who occupied places of trust about the person of the young queen. Her marriage, in 1835, with Augustus, Duke of Leuchtenberg, and, after his death at the end of a few months, her marriage with Ferdinand of Saxo-Coburg, were followed by grave political disturbances. A branch of the democrats, known as the Septemberists, from the month in which they made their first decisive stand against the government, loudly demanded (1836) the abrogation of the charter of 1826 (known as the Charter of 1826), and the restoration of the democratic constitution of 1824. This contest of the charters continued through the entire reign of Maria, and party feeling ran so high that it resulted more than once in hostilities. The government of Ferdinand alternately supported by Septemberists and Chartists; one Cortes was dissolved after another; finally, in 1852, a revised charter was drawn up that proved acceptable to all parties. Shortly afterwards the queen died, and her eldest son ascended the throne in 1853 as Pedro V., under the regency of his father. The latter used his power discreetly; and by his judicious management the financial confusions and embarrassments were partially removed.

Upon the sudden death of Pedro in 1861 his brother was proclaimed king as Luis I. He steadily adhered to constitutional principles, and laboured at measures of internal improvement; but ever since the beginning of the century the royal power has been growing weaker and weaker. The financial condition of the country has also grown more difficult, in spite of fairy favourable commerce. The road to the En Gawa powers to appropriate African soil, and divide it amongst them, since the opening of the interior through the Congo, in some degree awoke the old colonial enterprise of the Portuguese, and threatened national pride, and all the more tenaciously to the fragmants of colonial territory still left to them in Afirca. But the welding came too late; the march of events and the energy of her rivals have wrested from her many square miles that she claimed as her own, but had done next to nothing to colonise and peopie, whilst instead of them, Portugal abandoned to their claims to Nyassaland, and two years later a treaty was signed defining the respective spheres of influence of the two countries in East and West Africa, especially in the basin of the Zambezi. Further delimitations were agreed upon in 1891. In the meantime Charles I. had succeeded his father, October 1889. The action of Britain occasioned an outburst of strong popular feeling in Portugal, which the republicans turned to their own advantage; and they were greatly helped by the successful revolution of the republicans in Brazil and the expansion of the empire (November 1889). But in the home country their advantage proved to be of only a temporary nature.

H. Major, Life of Prince Henry of Portugal, translated by Capt. and Lady Samuel; and Caroline (1890); Salisbury, Portugal and Its People (1893).

Language and Literature. — Portuguese, like every other branch of the Romance family of languages, has grown out of a local form of the Lingua Romana Rustica, and in course of time has ingrafted upon it many elements of Arabic from the Saracen invaders, and numerous verbal and idiomatic characteristics of the Frankish and Celtic dialects which were introduced with the Burgundian founders of the monarchy. The earlier forms of Portuguese bore close affinity to Galician; and, although Portuguese presented strong resemblance to its sister-language, the Castilian, in so far as both possessed numerous words of identical origin, it differed so widely from the latter in regard to grammatical structure as almost to merit the designation of an original tongue. The antipathy existing between the Portuguese and Spaniards, and the consequent strenuous efforts of the best Portuguese writers to distinguish their language from the Castilian, and to resist the introduction of further Castilian elements, had the effect of making Portuguese still more dissimilar from the sister-tongues of the peninsula, and the result has been a language that differs from pure Spanish in having a peculiar grace and musical cadence, with a softening or lisping of the consonants, and a deepening of the vowels, which renders it the softest, but feeblest, of all the Romance tongues. The earliest specimens of genuine Portuguese belong to the beginning of the 13th century, and consist for the most part of collections or books of song (see Cancionero), which, both in regard to form and rhythm, resemble the troubadour or minne songs of the same period. Amongst the writers of these the most outstanding figure is King Diniz, who, besides being the forerunner of the Portuguese school of pastoral poets, also drew inspiration from the popular songs of his people. In the 14th and 15th centuries, whilst the romances of chivalry were popular and numerous chronicles were written, the best being that of Fernan Lopes (1380-1459), the court continued to be distinguished by courtly and aristocratic tastes, and the popular poetry was in greater vogue than Portuguese, which was despised by the numerous royal poets who emulated the example of Diniz, and composed love-songs and moral or didactic poems. Under the culture of those noble lands the poets grew more and more bolder, and without the tenderness and pathos which characterised the Spanish verse 'romances' of that age. But the literature of Portugal acquired new vigour...
with the growth of her maritime and commercial prosperity. The Cançãoário Geral (1516) of Garcia de Resende (1470-1554), which gives a general summary and history of the Portuguese poetry of the latter half of the 16th and beginning of the 17th century, is the first evidence of the change, which is most strongly exemplified in the dramas of Gil Vicente (1470-1530), and in the pastorals and eclogues of D. Mendes de Faria (1495-1558), whose dramatic imitations of Horace and Terence mark the transition period between the medieval lyrical and the later classical style. These first attempts at the drama were followed by Antonio de Ferreira's (1323-69) Ignes de Castro, the oldest, and still the finest, Portuguese tragedy. But the classical school, whose chief cultivators were the courtiers of Lisbon and the professors of Coimbra, found little favour among the people at large, whose enthusiasm and patriotism were deeply stirred by the discoveries and conquests of the nation in Asia, Africa, and America. The national pride and glory found expression in the works of Portugal's one really great poet, Camoens (1524-80; q.v.), who, in The Lusiads (1572), struck out a new path in the domain of epic poetry; while his numerous sonnets and dramatic productions exhibit a versatility of genius and graceful tenderness which place him in the foremost rank of European poets. Next after Camoens come the epic poets Corte-Real (1540-93), Mousinho de Quevedo (1540-1614), Pereira de Castro (1571-1628), and Sá de Meneses (1567-1606). To the same period belongs the dramatist Ferreira de Vasconcellos (died 1585).

With Camoens the language and poetry of Portugal reached the culmination point of their development. The Spanish and Portuguese so far lost all feeling of national independence that they at length renounced their native tongue, and adopted the language of their rulers. With the restoration of political independence, under the sway of the House of Braganza, a new school emerged; but the 17th and 18th centuries produced few Portuguese writers who attained more than an ephemeral and purely local reputation—bomast, or slavish imitation of Spanish and Italian writers. Among the principal characteristics of the Portuguese school of light literature, some Good Words belong; however, this period, as Jacinto Freire de Andrade (1597-1657), whose life of Joao de Castro, Vicerey of India, still holds its place as a monument of classical Portuguese prose; the great Indian missionary, the Jesuit Father Antonio Vieira (1608-97); whose sermons and letters are regarded as models of style and diction; De Barros (1496-1570), the historian of The Conquest of the Indies; De Faria e Sousa (1509-1649), De Brito (1509-1617), and Brandão (1534-1604), who wrote Monarquia Universalia; A. de Resende (1498-1529); and F. X. de Menezes (1673-1743). During the 18th century French literary canons and models were slavishly followed by most Portuguese writers of verse, of whom the best known is Da Cruz e Silva (1731-1800). But in the beginning of the 19th century Portuguese poetry was partially elevated from its previous low grade by two men, who, although they professed to observe a strictly classical style, possessed a delicacy of taste, and a general creative power, which saved them from falling into the absurdities that had generally characterised the school in Portugal; the elder of these, F. M. do Nascimento (1734-1819), although specially noted as an elegant lyric poet, deserves notice for his graceful miscellaneous; while Manoel do Boeco (1796-1806), his less cultivated rival and contemporary, must be regarded as the most original and truly national of the modern poets of Portugal. His sonnets rank as the finest in the language, and these, with his numerous idylls, epigrams, and occasional poems, composed in various styles and modes of versification, have had a host of imitators, among the best of whom are the dramatist, J. B. Gomes (died 1803); De Macedo (1761-1831), the epic poet; and the satirist, T. da Almeida (1741-1811). The best of the recent Portuguese poets are A. de Castilho (1800-75) and D'Almeida Garrett (1799-1854). The last named was the most versatile and popular writer of his time in Portugal. Next to them come Herenciano (1810-79), who is also one of Portugal's best historians; Da Silva Mendes Leal; De Lencos, founder of the Coimbra school; Palmeirim, De Passos, De Deus, Braga, and Du Quintal. Other modern writers who deserve mention are the historians De Luz Soriano and Latino Coelho; Branco and Biester, playwrights; the novelists Rebelo da Silva (who ranks after Herenciano as the scientific historian) and De Queiroz; and Lobo (1763-1844), a general man of letters. Portuguese literature is likewise cultivated in Brazil, as well as in late years, with considerable independence and success. The principal names in poetry are F. V. Barroso, De Barros, De Cunha Passos, De Carvalho, Goncalves-da-Cruz, Porto Alegre, M. De Macedo, Teixeira e Souza, and Magalhaens, the most national of them all; in history, Varnhagen, author of the Historia Geral de Brazil, and F. da Silva, author of the Brazilian Plutarch; and the epigrammatist Fonseca.

See T. Braga's Historia da Litteratura Portuguesa (14 vols. 1870-89), his Curso (1886) and his Antologia (1876); F. da Silva and Assunção's Dicionario Bibliográfico Portuguez (12 vols. 1888-89); Buterweck, History of Spanish and Portuguese Literature (Lond. 1823); and French works by P. Bouterwek, and B. L. and E. F. Kugler.
they are much diffused over the world, and are shrubby or herbaceous, generally succulent, mostly growing in dry places. The flowers are often large and showy, but are generally produced in large clusters and are in bloom and insipid. Some species are used as salads and pot-herbs, of which the best known is Purslane (q.v.). The tuberous roots of Cheltonia tuberosa, a Siberian plant, are used for food. The genera Calendrinia and Portulaca furnish some beautiful annuals.

Port Wine (i.e. Porto or Oporto Wine), a species of red wine, hot and heady, which is produced chiefly in a mountainous district of Portugal, called Cima de Douro, and exported from Oporto and Lisbon. The vine from which this wine is produced is generally planted on craggy slopes with a southern exposure. The wine, when pure and unadulterated (which is very seldom the case), does not acquire its full strength and flavour till it has stood for some years, to allow for the disturbance of the spirit to subside, and the antagonistic ingredients of the mixture to harmonise; but care must likewise be taken that it is not allowed to become too old. The colour of new port wine varies from pale rose to deep red, and changes with age, becoming a deep tawny brown, which is permanent. By far the greater portion of the wine is mixed with spirit even during the time of fermentation, in order to give the new wine the ripeness and strength which importers require, and which the wine does not naturally attain till it has stood for some time; the proper colour is also given by a mixture known as rouge, which is a preparation of elder-berries, molasses, raisin-juice, and spirit. It is an exception of this jargon in the inferior sorts of port which communicates to them the medicated colour so frequently noticed. The extreme 'headiness' of port is chiefly due to the liberal admixture with spirit, and this is the amount with all the wines generally exported, which average 35 per cent. of proof spirit. From the time when port came into demand (about 1700, though it was known in England for a considerable time before this) down to 1826 its export was a monopoly in the hands of the English merchants, but at a certain period increased with tolerable steadiness, year after year, till the three years ending 1840, when it reached 34,700 pipes of 126 gallons. The ultimate effect of this monopoly of the Oporto Wine Company was to increase the price of port wine in England, and at the same time so to deteriorate its quality that its course of time it became of less demand, and was largely supplanted by southern French and other wines. Since that period it has fluctuated, being sometimes more and sometimes less than this figure; in 1850 the exportation reached 57,457 pipes. Between 1890 and 1895 the exportations from Great Britain ranged from 3,000,000 to 4,000,000 gallons (not all for consumption in that country), and the value from £900,000 to £1,340,000. The natural wine, with less than 26 per cent. of proof spirit, is by law sold uninvigorating. The exports of port wine from Oporto in 1890 were 37,700 pipes valued at £1,471,000, but in the years 1880-97 decreased considerably on the whole.

Poscharszewatz. See Passarowitz.

Poseidon. See Neptune.

Posen (Polish Poznan), a province of Prussia, bounded N. by West Prussia, E. by Poland, S. by Silesia, and W. by Brandenburg. Area, 11,178 sq. m. The Warthegau owes its existence to a waterland, which, navigable throughout the greater part of the

are several lakes in the east. Like Pomerania, it is essentially an agricultural province, nearly 62 per cent. of the area being arable land, 13 per cent. woodland, 20 per cent. meadow and pasture. More than 55 per cent. of the total is in the hands of large landed proprietors (see also Mecklenburg). Grain, potatoes, and hops are the principal products. The industry is not much developed, being limited chiefly to machinery, cloth, bricks, sugar, and beer. Pop. (1890) 1,751,412; of whom 889,000 are Poles, mostly in the rural districts, 725,000 Germans, principally in the towns, and 51,000 Jews. There is a Roman Catholic archbishop of Gnesen and Posen. The chief towns are Posen (the capital), Gnesen, Bromberg, Lissa, and Rawisch. Posen formed an integral part of Poland till 1772, when, at the first partition, the districts north of the Netze were given to Prussia; to these were added in 1793 Great Poland, except Masovia, the whole being incorporated under the name of South Prussia. In 1807 Posen was included in the duchy of Warsaw; but by the Congress of Vienna it was re-assigned to Prussia under the title of the Grand-duchy of Posen. In 1848 the Poles gave the Prussian government considerable trouble. See History by Chr. Meyer (1881).

Posen, the chief town of the province, and a fortress of the Holy Roman Empire (1827-53), is situated 160 miles south-west of Warthe, 158 miles by rail E. of Berlin. One of the most ancient cities of Poland, it became the seat of a Christian bishop in 908, and it was the capital of the early Polish dukes. In the 17th century it was an important trading mart, but by the end of the same century had begun to decline. Recent improvements have rendered it one of the most pleasant towns in Prussia; it has regularly built streets and squares and handsome suburbs. The fortifications have been strengthened by detached forts built in 1876-84. The cathedral, a Gothic pile dating from 1377, has attached to it the 'Golden Chapel' of Count Raczyński, which is adorned with valuable treasures and works of art. The principal secular buildings are the town-house (1508), containing valuable archives; the Raczyński Palace, with a library; the Działynski Palace, both are built in the Renaissance style. Posen is a provincial museum of antiquities. The chief manufactures are artificial wools, agricultural implements, furniture, carriages, &c.; and there are likewise several breweries, distilleries, and flour-mills. Pop. (1875) 60,988; (1890) 69,627, about one-half urban and 355 urban bulls. It is the chief Jewish city, though the Jews number nearly 7000. See Histories by Lukaszewicz (1881) and Uhlschläger (1886).

Posidonia. See Pecten.

Posidonius, a Stoic philosopher, born at Apaneia, in Syria, about 135 B.C., who studied at Athens, and settled at Rhodes, whence in 86 he was sent as envoy to Rome. Here he became intimate with Cicero, Quintus Pomponius, and other illustrious Romans. He died at the age of eighty-four, leaving works on philosophy, astronomy, and history, of which only fragments have been preserved.

Posilipo (from a villa here called Pastrisipon, 'Pausa-sound,' which at one time belonged to the Emperor Augustus), a mountain on the north-west of Naples, opposite the city of the same name. It is the site of an old noble site for the villa of wealthy citizens. It is remarkable for the tunnel known as the Grotto of Posilipo, through which the road from Naples to Pozzoni (anc. Puteoli) passes. The grotto varies in height from 20 feet to 80 or more, is 20 to 30 feet wide, and 135 yards long. It is traditionally said to have been made in the reign of Augustus, but is probably earlier. Above the eastern entrance of the grotto is the so-called
POSITIVISM

1. Tomb of Virgil. At the base of the hill anciently stood the poet’s villa. During the middle ages the common people believed the grotto to be the dwelling of the poet, whom they regarded as a great magician. Two other tunnels were bored from the hill, one to the north of the grotto, 800 yards long, 39 feet high, and 33 feet broad, made for the tramway, and another constructed at the command of Agrippa in 37 b.c., but only discovered in 1818.

2. Positivism, the System of Thought and Life founded by Auguste Comte (1798-1857; s.v.), is defined by him as consisting essentially of a ‘philosophy and a polity which can never be dissevered; the former being the basis, and the latter the end, of one comprehensive system, in which our intellectual faculties and our social sympathies are brought into close correlation with each other.’ He chose the word Positive on the ground of its indicating the reality and constructive tendency which he claimed for the doctrine in its theoretical aspect, while he anticipated that in the future the term would acquire a wider meaning by suggesting also similar ideas in the sphere of feeling and action. The two primary characteristics of Positivism, the philosophy and the polity, were finally welded into a whole under the conception of a religion, which has for its creed the new synthesis established by the one, and for its moral law the social reorganisation proposed by the other. We may best consider Positivism under these three aspects.

3. Positive Philosophy.—Comte’s primary aim was to put an end to the intellectual and social anarchy which had resulted from the destructive criticism and the revolution and to show the way out by supplying an interpretation of phenomena which should organise our knowledge of the world, of man, of society, into a consistent whole. Such a universal synthesis must the new philosophy provide in form, for the titanic task of a new art of life.

4. Historical analysis revealed to Comte, as a law of mental growth, the progress of all human conceptions through three distinct phases. The primitive stage he called the theological; the transition stage, the metaphysical; and the final stage, the positive stage. These three general terms in the restricted sense of the words are most concisely explained by Stuart Mill’s translation of them into volitional, abstractational, experiential. The transition was effected by the gradual acceptance of the scientific method of induction from observation of phenomena as the only sound basis of the solution of all problems, whether other than phenomenal being finally given up as fruitless. Science, therefore, is the instrument capable of effecting the desired unity; and the problem of the positive philosophy is a threefold one: (1) to bring all knowledge within the sphere of scientific investigation; (2) to extend scientific methods through the whole territory of each division; (3) to co-ordinate the results obtained from the separate sciences; so as to approach an expression of all our knowledge in terms of a single doctrine. All these parts of this problem Comte considered to be in a demonstrative degree solved by his Classification of the Sciences.

5. He observed that the several classes of conceptions advanced from the theological to the positive stage with different degrees of facility, and on investigating the causes of these progressions, he found that the order of emancipation of the various sciences was determined by the degree of complexity and the consequent relations of dependence. A preliminary distinction was made between the abstract and the concrete sciences, the former treating of the general and the latter of the special, by the phenomena of any class, and the latter depending on these and treating of definite objects under the several aspects in which they may be viewed. The concrete sciences, Comte considered, did not yet admit of co-ordination, and he confined his classification to the abstract sciences, which he placed in the following series: (1) Mathematics; (2) Astronomy; (3) Physics; (4) Chemistry; (5) Biology; each of these classes dividing the preceding science, and adding a new order of conceptions peculiar to itself. This series he found coincident with the sphere of knowledge then supposed to admit of scientific treatment. But there remained his phenomena of society, forming a wide field of inquiry to which positive methods had never yet been applied. Certain tentative efforts had indeed been made to construct a so-called science of history—notably by Montesquieu and Condorcet—but no one before Comte had formulated the principles on which such a task might be accomplished. By his discovery of the methods proper to a rational study of social phenomena, and by his dicta—that owing to the complexity of the conditions involved, the laws of such phenomena cannot be determined a priori, but must be inductively observed, and afterwards verified and co-ordinated by deductive application of the general laws of life; that the statistical condition of each historical period must be viewed in its totality, as determined by the interaction of the various classes of social factors; that intellectual evolution affords the true measure of development; and that the evolution of these and other doctrines Sociology was created and established in the hierarchy as the last and crowning science of the series.

6. The whole realm of fact was now included in the domain of positive inquiry, and Comte next addressed himself to the inquiry of the separate departments of knowledge. In the earlier portion of this task his mathematical aptitude ensured him a large measure of success; while in biology he paved the way for further developments by his organisation of the materials then available. His main services, however, in scientific co-ordination were in the department of sociology. Besides the formal constitution which he gave to the new science, his chief substantive contribution was his enunciation of the fundamental law of intellectual development, which all his other theories served to illustrate. His cardinal doctrine of the positive philosophy. The process of thought, moreover, from theological to positive conceptions was shown to be coincident with a progression in social action from an aggressive militarism, through a period of defensive attitude, to the first regime of industrialism. The series of transitions in which, as in the series of transitions of all sciences, our increasing knowledge of the conditions of our existence and our systematic efforts to modify them, are mutually and necessarily dependent, our increasing knowledge of the conditions of our existence and our systematic efforts to modify them, are naturally reacting on each other.

7. The main problem of the positive philosophy, the unification of knowledge, was not yet ripe for its final solution in the days of Comte, but his classification of the sciences is regarded by his followers as affording an admirable framework for the theory of evolution advanced at a later date with the claim of supplying this want. Comte was fain to be content with the partial solution of a sublime unity in the suberviance of all the sciences to the needs of man.

8. Positive Polity.—On the basis of the philosophy he had thus established Comte founded a scheme for the regeneration of society. The ethical portion he did not live to complete, but in his elaborate exposition of the art of social politics we have ample insight into his views on what he considered an integral part of his system. We have space here only for a bare outline.

9. The true measure of man’s life must be that which rests on the fullest knowledge. We naturally strive to improve those conditions of our existence which we can affect in the direction indicated by the clearer
POSITIVISM

light of a new synthesis. What, then, are the evils or imperfections of our lot which may be remedied by positivity? Positivism, throughout, its laws are wholly beyond our direct influence, and we can only to a limited extent affect the conditions of their action. But in the science of man we ourselves are the factors, and our efforts to modify our environment form the subjective aspect of Positivism, if we most correctly consider, a law of social development.

Comte believed the first requisite of systematic action to be the recognition of a central intellectual and moral authority dissociated from practical politics, which he proposed to secure by organizing a Spiritual Power, consisting of promoters, supported by the state. This class, exerting a purely moral control, yet supreme in all affairs of private and social life in virtue of its natural prestige, would have only an indirect influence on political action. The temporal power should be in the hands of capitalists, the captains of industry—i.e., in their own order and naming their successors—who would feel a moral responsibility to the spiritual power, especially when the authority of the thinkers should be strengthened by the support of women and of the working classes, whose ready adherence to positive principles Comte firmly anticipated. Besides the corrective influence of each of these powers on the other, an efficient check on despotic control on the part of either is provided in the perfect freedom of opinion and expression allowed—a freedom the more valuable that it would rest on a system of scientific and moral education, which it would be one of the chief functions of the spiritual power to direct and enforce.

With the decline of militarism and the growth of industrialism Comte foresaw that political action would in the future be mainly directed on the organization of labour for the benefit of society at large. No idleness would be permitted; all would be workers. The distinction between the capitalists and the workmen, the rich and the relatively poor, would remain; but the former would be taught to hold their wealth as a trust from society to be used for the benefit of all, while the latter would also come to regard themselves as performing public functions, serving society each in his place. These views are substantially similar to such more recent economic teaching as that of Carlyle and Ruskin in Great Britain.

In the sphere of morals the main office of the spiritual power would be to strengthen the social tendencies of man at the expense of the personal, a process made possible by the development of the affections originally called forth in family life. In the sphere of intellect it should regulate and concentrate the labours of its members, putting an end to the present ‘dispersive speciality’ of scientific aims, and determining the direction of all intellectual efforts by reference to social needs. In this constructive and constructive sphere of Positivism Comte applies these general doctrines to the immediate future, by propounding a scheme of concerted action for a great Western Republic, embracing the French, English, German, Italian, and Spanish nations—an organization imperfectly expressed by the influence of Faddism and Christian

Positivist Religion.—Such are the creed and the practice of Positivism. But a religion is more than creed and practice; there must be a sentiment, an appeal to the heart, a satisfaction of the feelings. The positive is subjective, it is a reaction reverted, proposed by Comte to succeed the idea of a Deity (whose existence he considered impossible either to affirm or deny) is that of Humanity, regarded as a collective unity, a great being, consisting of all the men and women past, present, and to come, whose lives have been or shall be devoted to the best-being and for the best of humanity. To this partly ideal yet wholly real, capable of being definitely conceived, and not beyond the reach of our services, would gather round it all our affections for our fellow-men; gratitude and reverence for those who have struggled and achieved in the past have made us what we are; love and sympathy for all round us who are striving after better things; hope and effort for the more perfect life of those yet unborn. Comte looked on the religion of Humanity as fulfilling all the highest aims sought by the religions of the past, and especially as the generalization of the ethical of Christianity, the historical value of which he thoroughly appreciated as a transitional phase of religious development. The worship of Humanity was to consist in prayer, taking the form of high resolve and profound communion with the noble spirits among the dead, and in public commemorations, for the observance of which a calendar was suggested, associating each day of the year with some great name in the roll of mankind, and arranged so as to illustrate the course of human history. Positivism would carry on the traditions of the priesthoods of former religions, preaching self-abnegation as the rule of life that brings the highest happiness, and offering no reward, save a place in the ‘cloud invisible’ of the great and good, whose names are cherished in the hearts of those who follow them, and whose influence will live to the end of time.

Positivism is of too recent origin to be adequately treated except in an account of its genesis, and the above outline of the system has therefore been entirely confined to that of this life; the secret activities attached to himself a body of disciples more remarkable for intellectual eminence than for numbers. The most prominent of these was M. Liétré (q.v.), who afterwards edited his master’s works, and established a review with the title of La Philosophie Positive. His discipleship, however, did not extend to the later developments of the system. Near the end of his life Comte founded the Positivist Society, an organization which still has its headquarters in Paris. Among the best known of its members are Mr. Frederic Harrison, Dr. Bridges, and Professor Decury, who have translated Comte’s chief works and have published many expository and illustrative papers and addresses. There are two centres of Positivist activity in London, each with connections in other large towns. One of these, which is presided over by Mr. Congreve, has introduced more of a ritual into its services; while the best-known group, associated chiefly with the name of Mr. Frederic Harrison, and having its headquarters at Newton Hall, Fetter Lane, devotes itself mainly to extending a knowledge of the system by public addresses and various forms of practical effort.

Among sympathetic critics of Positivism are many thinkers of eminence imbued with the positive spirit, and more or less indebted to the genius of Comte. Stuart Mill, in his work Auguste Comte and Positivism (1865), though taking an independent standpoint, speaks in terms of high appreciation not only of the leading doctrines of the positive philosophy, but also of the conception of Humanity as a great and wonderful keystone of the new religion. Many of the details of ritual and worship, however, were repugnant to him, as they have proved to many; and, while exaggerating the importance of the Conscience, he makes no allusion to the connection between the earlier and the later portions of Comte’s career. His book should be read along with Dr. Bridges’ reply, entitled The Unity of Comte’s Life and Doctrines (1865). Mr. Spenner in his Life of Comte vindicates his independence of Comte than to acknowledge his obligation to him. His references to his great predecessor mostly concern their disagreements. In
two essays, one on The Genesis of Science and the other on The Classification of the Sciences, he opposes Comte's views on these subjects; and he has even thought it worth while to write a second edition of his Essay on the Development of the Philosophy of M. Comte. Mr Spencer's exposition of the theory of evolution is regarded by Positivists as a valuable contribution to that scientific philosophy, the aim of which is for the benefit of mankind.

G. H. Lewes, in the chapter on Comte in his History of Philosophy, calls him the greatest thinker of modern times, and declares himself an ardent adherent of Positivism. For this reason, however, Lewes' feeling is one of partial sympathy only. In George Eliot's works the influence of Comte's doctrines is evident, and she has devoted one of her novels to the annihilation of Intelligentism and religion, an issue in which Comte and Lewes found themselves linked. In Lewes' view, the scientific spirit can only be fostered by a religious idea, and he has devoted a whole number to the subject.

In theologick alae. Britain possession, distinguished the man the ownership article Dr. Later scientific added what most interest reversion the. enacting, enforcing them the resistance, raising him. physicians, of tivism', sympathy Positivism, History of. Comte's Ency. Brit.; Professor Edward Card, Social Philo-

sophy and Religion of Comte; Dr J. M'Cosh, Christian-

ity and Positivism; Dr Martineau, in Types of Ethical Theory; Professor Huxley, 'Scientific Aspects of Posi-
tivism,' in Lay Sermons; and Mr A. J. Balfour, Religion of Human-

ity. Among critics wholly antagonistic to Positivism are naturally to be found the theologians, the so-called metaphysicians—i.e. all whose explanations of phenomena either assume the action of supernatural beings or are expressed in terms of abstractions such as vital principle, intuition. But Comte still evaded all such interpretations of his system; he professed merely to express his general conceptions, and leaves them open to theological and metaphysical influences beyond the immediate sphere of their own speciality. The opposition of these classes follows from the refusal of the latter to accept the modern recognised modes of thought to other than an historical importance.

Posse Comitatus ('the posse of the county', the infinitive 'to be able' being used in late Latin a noun, and meaning power or force), the whole force of the county, consisting of knights and men above the age of fifteen, with constables, who attend the orders of the sheriff to assist in enforcing process or quelling riots. Justices of the peace can also, if apprehensive of an organised resistance, command the services of the posse comitatus, and it is the sheriff's duty to raise the necessary number of men. But practically, in modern times and specially in large cities, they have all the assistance given or required. See SHERIFF.

Possession is the relation which subsists between a person and a thing, when the person has control over the thing, and maintains his control with the intention of exercising rights over the thing. A man may be in possession of what is not his own; a thief enters into unlawful possession of another's goods; a farmer has lawful posses-
sion of his landlord's property. Again, a man may own a thing without possessing it, and the law prescribes the forms of action, &c. whereby an owner may recover possession of his property. In a reasonably well-governed community possession is evidence of right to possess; the person in possession is therefore protected against all the world, unless there is some other person who can show that he has a better title: this is what is meant by saying 'possession is nine points of the law.' To speak sometimes of an interest in possession, as distinguished from an interest in reversion or remainder: thus, the person who is entitled to receive the rent of land has an inter-

est or estate in possession, though he does not possess the land. In common speech possession is frequently used for a right; for instance, legal purposes the two ideas must be carefully distinguished. See Hunter's Roman Law; and Pollock and Wright's Essay on Possession in the

Common Law (1888). There may be joint-ownership in either personal or real property, one of the characteristics of this kind of ownership being 'benefit of survivorship'—i.e. if one of the joint-

owners dies his interest accrues to the other, and does not pass to the deceased's heirs or representatives. In partnership, when one partner dies his share belongs to his own personal rep-

Possession, DEMONIA. See DEMONOLOGY, EXORCISM.

Posset, a dietetic preparation, made by curd-

ing milk with some acidulums liquor, such as wine, rose-water, white wine, vinegar, or lemon-juice. The posset is often preferred, but sometimes old ale is used. The milk is boiled, and whilst it is still on the fire the aci-
dulous matter is added; if sherry, about a wine-
glassful and a half to the pint of new milk is the proportion, or twice the quantity if ale. A tea-

spoonful of vinegar or of lemon-juice is sometimes used instead; one or two tablespoonsfuls of treacle may be added, to sweeten. Taken at bedtime, it is used for colds and coughs.

Post-capitain. See CAPTAIN (Naval).

Postglacial and Recent System. The deposits belonging to this system contain the remains of plants and animals, few of which are very abundant. The most important animal remains are those of the great mammals, being the oldest of the large herbivors, and the most ancient of the Flora and Fauna of the Neolithic Age, and the postglacial or recent period.

The flora and fauna of the period are essentially the same as at present. In the earlier stages of the period, however, the flora of north Germany, Denmark, southern Sweden, &c. was arctic-alpine, and that flora was accompanied by the northern mammals, including the reindeer, &c. Later in the period, as the climate became more genial, the northern flora and fauna disappeared from the low grounds of north Europe, and the flora and fauna of the more southern and genial parts of Europe took their place. Of the more notable mammals of the period in Britain were Megaceros (Irish deer), Bos primigenius, and Bos longifrons. The oldest traces of man met with at this stage belong to the Neolithic period.

Several geographical and climatic changes appear to have supervened in postglacial and recent times. After the Scandinavian flora and fauna had been succeeded in our area by the present assemblage of plants and animals, the climate appears to have become even more genial than it is in our day. The vegetation of the period by which these trees do not now grow, and reached elevations on the mountains which they cannot now attain. At the same time many southern types of molluscs
migrated into northern seas, some of which have since died out, or still survive in diminished numbers and dwarfed in size. To this genial stage belonging in invaded, the former low-lying, the lower buried forests of the bogs. Eventually the climate changed and became wet and cold. The British area, formerly continental, was insulated and of less extent than now—the sea overflowing the low ground of Scotland up to a height of 50 to 60 feet level. The vegetation pacers that made their appearance in many mountain-gleams, and these areas the place where the 'carse-clays' (45-50 feet terrace) belong to this stage. The climate was not so favorable for the growth of great trees, which were more restricted in their vertical and horizontal range. Over wide areas the forests decayed and became buried by mosses and their allies. The general occurrence throughout north-western Europe of a second well-marked 'buried forest' seems to indicate a return to more genial climatic conditions, giving rise to a second period of great forests, which gradually overspread much of the moory and waste lands. Coincident with this second forest-epoch there appears to have been a gain of land, at least in Scotland, but there is no evidence to show that Britain again became continuous. The second forest epoch was succeeded by one that first had been by somewhat cold and wet conditions, under the influence of which the forests decayed, while swamps and morasses increased. At the same time the Scottish area became depressed for some 25 feet or thereabout below its present level. The last physical change of which there is clear evidence is the final retreat of the sea, while the general aspect of the bogs (in which the rate of decay exceeds that of growth) would seem to indicate that we are living under drier conditions than obtained when the second forest-epoch came to a close. See EUROPE, STONE AGE.

Post-horn. See HORN.

Posting, the forwarding of passengers from place to place by means of relays of horses. Posting was long in Britain, as it is yet in some parts of the Continent, a government monopoly. See POST-OFFICE.

Post-mortem Examination. Examination of the body after death is a duty which has frequently to be discharged by medical men in various circumstances, of which the most important are: (1) cases of sudden or accidental death; (2) cases of lingering illness, in which the nature of the disease had not been determined during life; and (3) cases of suspected suicide or homicide. Such examinations cannot legally be undertaken until twenty-four hours have elapsed after death, and permission or warrant must be obtained for the performance of the examination. In ordinary cases where the examination is necessary or advisable for the purpose of throwing light upon the nature of the fatal illness, and where no judicial question is involved, the presence of the parents, relatives, or guardians must be procured. In medico-legal cases the order of the coroner (in England) or of the procurator-fiscal (in Scotland) is essential. In such cases the examination should always be performed by two medical men, one of whom is desired to be an expert. In all cases the position of the body and of the surrounding objects should be carefully noted, as they often throw light upon the cause of death. The external appearances of the body, such as the presence of rigidity and of post-mortem changes, should be observed, as affording a certain indication of the period at which death occurred. In medico-legal cases every organ in the body should be carefully examined, and its condition briefly but accurately noted. A careful microscopic examination should follow if there be the least doubt as to the nature of the disease condition present. Finally, in cases of suspected suicide or homicide, the body should be subjected to chemical analysis. The study of the changes wrought in the various organs by disease has been one of the most potent factors in advancing scientific medicine.

Post-nuptial Contract. See HUSBAND AND WIFE, SETTLEMENT.

Post-obit (Lat. post obitum, 'after death') is a bond of security given by heirs and others entitled to reversionary interest, whereby, in consideration of a sum of money presently advanced, the debtor binds himself to pay a much larger sum after the death of some person, or of himself. Whenever, as is not unusual, the payment is uncertain, and depends on the obligee outliving somebody else, very high interest is required, or rather a very much larger sum is agreed to be repaid than what is advanced. These are generally usurious bargains; but the obligee or creditor can enforce payment of the full amount; though, if there is a great excess of inadequacy in the proportions amounting to fraud, a court may consider it void.

Post-office. (1) A government department whose chief business it is to convey letters from place to place; and (2) any office or agency appointed by that department for the reception, despatch, or delivery of letters. Although letter conveyance is the primary work of the post-office, many other branches of business have been assumed by it. The word post is derived from the Latin postus, meaning 'placed', 'fixed,' and comes to have its particular application from the posts, or stages, at which on the roads of the Roman empire couriers were maintained for the purpose of conveying news and despatches. Herodotus mentions that a system of couriers existed in the Persian empire; and Xenophon states that post-stations or houses was established by King Cyrus. Marco Polo describes a similar system existing in China in the 13th century, the stations being only three miles apart, thus securing great rapidity of communication. Among the ancient Aztecs in Mexico a complete system of couriers was likewise maintained, the stations being about two leagues apart, and providing a rapid means of communication by foot-messengers. In all these cases the work was done on foot, and the posts so set up for government service only.

The first letter-post in the modern acceptance of the word seems to have been established in the Hanse towns in the early part of the 13th century. A line of letter-posts followed, connecting Austria and Lombardy, in the reign of the Emperor Maximilian, which are said to have been organised by the princes of Thurn and Taxis; and the representatives of the same house established another line of posts from Vienna to Brussels, connecting the most distant parts of the dominions of Charles V. The family of Thurn and Taxis continued to enjoy certain privileges in connection with these posts down to 1807, when they were ceded by treaty to the Prussian state, and have since been assumed by the German empire.

In England in early times both public and private business was conveyed by special messengers only; later on they were frequently conveyed by common carriers plying with their pack-horses. In the reign of Edward I., 'posts' were established where horses could be had for hire by messengers wearing the royal livery; and in the reign of Edward II., a post-station was set up at the period of the war, so that private messengers might travel 'post.' In 1481, when Edward IV. was at war with Scotland, a system of relays of horses was
established in the north (probably from York to Edinburgh) in order to provide the king with the latest news in his camp. This arrangement, however, ceased on the restoration of peace. In 1648 the charge for post-horses impressed for government service was reduced by act of parliament, per mile. Camden mentions the office of 'Master of the Postes' as existing in 1581; but the duties of the 'Master' were probably confined to the supplying of post-horses. The foreign or alien merchants in London established a post office there from London to the outports in the year 1514, appointing their own postmasters; but dissensions occurred among them, and the matter was referred to the government in 1588. At this time also the English merchants complained of unfair treatment by the foreign post; and the consequence was that the government set up a post-office for letters to foreign countries for the benefit of the English merchants. The first inland post was established by Charles I., who in his proclamation of 1633 refers to the uncertainty of communication between England and Scotland. The proclamation thus proceeds: 'Wherefore, he now commands his Post-master of England for foreign parts to settle a running post or two, to run night and day between Edinburgh and London, to go thither and come back again in six days, and to take with them all such papers as shall be directed to the post-town in or near that road.' At the same time by-posts were to be connected with the principal towns lying off the main line of posts. In 1637 a proclamation prohibited any messengers or foot-posts to carry letters other than the messengers of the king's postmaster-general, with certain specified exceptions. This inland post was placed under the charge of Thomas Witherings, who, with William F rizell, had been entrusted with the English post for foreign letters from the year 1632. In 1640, in post of irregularities, Witherings was superseded in his office, which was then entrusted to Philip Burellacli. Eight main postal lines throughout England were at this period set up. The rates of postage for a single letter were as follows: not exceeding a distance of 40 miles, 1 Penny; 41 to 150 miles, 2 Pennies; beyond 150 miles, 4 Pennies. The great distance in England, 6d.; to Scotland, 8d. In 1649, in the time of the Commonwealth, the court of Common Council for London set up a post in rivalry with that of the parliament; but the Commons promptly put an end to the undertaking. Material changes were made in the post-office, and Cromwell and his parliament in 1657, and an ordinance bearing on the subject furnishes a motive for the establishment of posts—that they will be the best means to discover and prevent many dangerous and wicked designs against the Commonwealth.' At the Restoration the settlement of the post-office made during the Commonwealth was confirmed, and its substance was re-enacted by statute 12 Carols II. cap. 35, which act, being the first strictly legal authority for the establishment of a post-office, has since then been looked upon as its charter. Although in 1633 something was done towards establishing posts between England and Scotland, little was attempted as regards internal communication in Scotland till 1635, when the Scotch parliament passed an act for the government of the private post. 1635 an upholsterer named Robert Murray set up a penny post for the conveyance of letters and small parcels about London, which business was subsequently assigned to Thomas Dockwra. This undertaking was, however, seized by the government and the management of it was in the future, and Dockwra was granted a pension of £200 a year by way of compensation. This system was the commencement of the London Postal District service, and Dockwra was afterwards appointed its controller. About the year 1700 robberies at the posts were so frequent in the neighbourhood of the Borders that acts were passed by the Scotch and English parliaments making robbery of the post-office a grave offence. With the establishment in 1708 a Mr Povey attempted to set up a halfpenny post in London; but this was suppressed as the result of a lawsuit at the instance of the government. By a statute passed in 1710 the post-office was remodelled, a general post-office for the three kingdoms being established and the offices being established under 'Her Majesty's Postmaster-general.' This officer was empowered to keep one chief letter-office in London, one in Edinburgh, one in Dublin, one in New York, and one in the West Indies. The Irish parliament in 1784 passed an act, giving the Irish post-office a separate existence, and creating an independent postmaster-general; but the offices were again united under the British postmaster-general in 1831. In the year 1776 a penny post for Edinburgh and Leith was set up by Peter Williams, and continued on until about 1792, when it was absorbed by the General Post-office. In 1720 Ralph Allen (1694-1764) obtained a lease for life of the crosses-posts at a rent of £5000 a year; and so greatly did he improve the revenue from this source that he realised an annual profit of £12,000, which he lived to enjoy for forty-four years.

The institution of mail-coaches (see Coaching) marks a very important period in the history of the post-office. Their introduction is due to Mr John Palmer, manager of the theatre at Bath, who submitted his plan to Mr Pitt in 1763. In order to carry out his plan Mr Palmer was appointed Controller to the General Post-office, with a salary of £1500 a year and 2½ per cent. on any excess of revenue over £240,000 a year. The running of mail-coaches commenced in 1784, the plan being carried out, like the later great scheme of Sir Rowland Hill, in the face of vehement opposition on the part of officers of the post-office. The new method of conveyance, however, proved most successful, both on account of greater safety to the mails, and acceleration of the correspondence. In 1792 Mr Palmer was superseded from the post-office, and allowed £3000 a year being made to him in lieu thereof; but after a long struggle with the Treasury parliament in 1813 made him a grant of £50,000. The mail-coach era may be said to have covered a period of sixty years, during which time the great road engineers so improved the highways that the speed of the coaches was increased from about six to fully ten miles an hour. Mails were first sent by railway in 1830 over the line between Liverpool and Manchester.

In order of time the next great feature in the history of the post-office is the uniform penny postage scheme of Mr (afterwards Sir) Rowland Hill (q.v.). He suggested his plan of reform in 1837. It evoked strong opposition within the post-office and from a section of the public without; but it was eventually adopted by a majority of 100 in the House of Commons, and the scheme was launched on the 10th January 1840. Immediately prior to that date the inland postage rates were as follows for an ordinary single letter:

<table>
<thead>
<tr>
<th>Distance</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>16 miles and under 20 miles</td>

</tbody>
</table>

For every additional 100 miles 1d. and for every letter carried over the Borders an additional ½d.
The extra halfpenny was charged as an indemnity for toll dues from which, by the Act 53 of Geo. III., 1813, mail conveyances in Scotland having more than two wheels were not exempt. These were the initial rates payable for single letters—i.e., letters not containing an enclosure. If a letter contained an enclosure the letter became a double letter, and double postage was claimed. For a letter weighing an ounce the charge was quadrupled, and each quarter of an ounce in addition added an additional rate to the charge. Under the Act 53 of Geo. III. a letter weighing 1 oz. was levied according to weight, commencing with a penny for a letter not exceeding half an ounce, and a penny for every additional half ounce, irrespective of distance within the kingdom which the letter had to be conveyed. The uniformity of rate as regards distance has been maintained till the present day, though the Rowland Hill scale has been altered. Thus, in 1871 the initial half ounce letter ceased (as regards inland letters), and the scale became as follows: Not exceeding 1 oz. 1d.; not exceeding 2 oz., 1½d.; not exceeding 3 oz., 2½d.; not exceeding 4 oz., 3½d.; not exceeding 5 oz., 4½d.; not exceeding 6 oz., 5½d.; not exceeding 7 oz., 6½d.; not exceeding 8 oz., 7½d.; not exceeding 9 oz., 8½d.; not exceeding 10 oz., 9½d.; not exceeding 11 oz., 10½d.; not exceeding 12 oz., 11½d.; not exceeding 13 oz., 12½d.; and 12½d. being charged for each additional ounce. In 1885 this comparatively heavy charge over 12 oz. was removed. The privilege of Franking Letters (q.v.) enjoyed by members of parliament till 1840, which was a great loss to the revenue, ceased on the 1st January, 1841. Envelopes were introduced, bearing a revenue stamp or mark for postage, and known as the Mulready envelopes, from the name of the artist who prepared the design; but the public would not take to them, and their issue was discontinued. Postage stamps, in early times, were based on the halfpenny, but at this time, and have since continued to be used. The following figures show to what extent cheap postage has stimulated the correspondence of the country. In 1839 the number of letters passing through the post, including franked letters, was 82,500,000; in 1840 the number at once rose to 169,200,000; and in 1890 the number was no less than 1,650,200,000. In addition to this mass of written matter, besides 217,100,000 post-cards, the following articles passed through the post in 1890: Bookpackets and cards, 4,472,500; newspapers, 150,300,000. For some years after the introduction of Rowland Hill's scheme there was a deficit in the post-office revenue, but this was soon covered by the rapid growth of business, and for many years the post-office has paid large yearly profits to the Treasury. In 1890 the gross revenue from all branches of post-office business was £21,211,614; the expenditure, £8,863,527; and the net revenue, £12,348,087. Halfpenny post-cards were introduced in October 1870, and the penny postage upon newspapers was reduced to 1d. In 1898 2,012,300,000 letters were posted; post-cards, 389,400,000; book packets and circulars, 727,300,000; newspapers, 150,900,000; parcels, 67,823,000. The revenue for the year was £12,429,376, and the expenditure £8,682,713, giving a profit of £3,746,664. In the end of 1898 penny postage was introduced throughout the United States, Canada and the Cape, and one or two minor possessions. From 1891 the railway companies were empowered to convey single letters for the public, between their stations, on behalf of the post-office, provided the letters do not exceed 1 oz. in weight. Such letters are charged at the rate of the value of 1d., which goes to the revenue, and a railway stamp of the value of 2½d., which goes to the companies as payment for conveyance. In March 1891 a system of express delivery for letters and parcels was established in London and certain of the more important towns in the kingdom; and shortly thereafter it was made general throughout the country. The delivery is effected by means of the messenger force employed in the telegraph service. When railway, omnibus, or tramcar conveyance only is used by the messenger, the fee, in addition to the ordinary postage, is twopenny for the first mile, and three pence for each additional mile. Higher fees are charged for cab conveyance.

Postal Union.—Under the terms of a treaty concluded at Berne on the 9th October 1874, the object of which was to secure uniformity in the treatment of mail-bags, the members of the Postal Congress, on the 2nd June 1875, agreed to the establishment of a special system of accounts, as well as the reduction of rates within certain limits, and whose provisions were carried into operation generally on the 1st July 1875, the whole of Europe, the United States of America, Egypt, British India, and all the colonies of France were at the outset, or shortly thereafter, included in the Union, and many other countries and colonies have since joined it. The rates of postage to the several states concerned will be found set forth in the British Post-office Guide. The international accounts in respect of postages among these states are settled every year, and by the terms of the treaty each state has the option of paying a levy of £25. The transactions are taken every third year. The rates of postage to Great Britain are not always the same as those from Great Britain, each country having a certain limited discretion in fixing rates.

Registered Letters.—In 1839 the postmaster-general issued an order that postmasters should disseize the public from sending letters by post containing cash in gold or silver, rings, or bracelets, &c.; but this order was rescinded in 1792. At the same time postmasters were again authorised to accept such letters; but before placing them in the mails the postmasters were required to mark the rear of the letters with the front of the letter bill and to tie the letters up with the bill. This mode of giving greater security to letters of value seems to have been the initial stage in the development of the registered letter system. The modern plan of registration is based on the principle that every registered letter must be signed for in passing from hand to hand; and, although the postmaster-general gives guarantee (under special conditions) to but a comparatively small amount, the system affords the public confidence. The great number of letters registered in the United Kingdom in 1890 was 11,357,335. The fee for inland registration, in addition to the ordinary postage, had for many years been fixed at twopenny; but on the 1st June 1891 a combined system of registration and insurance was introduced for letters and parcels, with fees ranging from twopenny to sixpence, and a maximum insurance of £25.

Money Orders.—In the year 1792, by permission of the postmaster-general, some half-dozen clerks who had charge of the 'country roads,' or despatching divisions, in the London General Post-office, set up a system of remittances for the public to and from the post-offices in England and the chief post-offices in Edinburgh and Dublin, the postmasters at these places acting as agents in the scheme. This was the origin of the money-order system, which for many years was managed entirely on their own account. It was not till the year 1838 that it became a recognised branch of the post-office establishment. In the earlier years the rates of commission were very high, thus preventing any extensive development of the business, but for many years the payment of small amounts, on a very moderate scale. In the period from 1850 till the present time the money-order system has been extended to a great many of the colonies and to foreign countries, and every year further extensions are being made. In 1890 the number of money-order offices in the United Kingdom was 9437. The amount of business done in
that year was as follows: Inland orders, 9,027,750, £23,333,417; colonial orders, 453,192, £1,631,616; foreign orders, 893,292, £2,590,872.

Postal Orders.—In pursuance of the recommendations of a committee appointed by the Treasury, of which the late Mr. George Moore, the philanthropist, was chairman, the transmission of money by means of postal orders was begun in London on the 1st January 1881. This simple method of remitting small sums of money has grown rapidly in public favour, and each year adds largely to the amount of business done. In 1890 the total number of orders issued was 44,732,518, representing an aggregate value of £17,737,902.

Post-office Savings-banks.—By Act 24 Vict. chap. 19, a system of savings-banks in connection with the post-office was established in 1861, affording great facilities for thrift to the industrial classes and to young people. The rate of interest payable to depositors is 2½ per cent., calculated upon complete pounds remaining with the post-office complete months. No single depositor may deposit more than £30 in any one year. The number of offices opened for savings-bank business up to the 31st December, 1889, was 4,742; in the 18th December 1889 the number open was 9,353. In this year the deposits numbered 8,101,120, amounting to £19,814,308, and the withdrawals were 2,757,545, amounting to £10,614,268. On the 31st December 1889 a total amount, including interest, remaining in the deposits was £62,999,620. The interest credited to depositors for the year was no less than £1,443,186. The post-office savings-bank is largely used by friendly societies, provident institutions, and penny banks as a safe place of deposit for their funds. Since 1880 depositors have had the right of withdrawing their money from savings-bank stocks with little or no trouble. On the 31st December 1889 the total amount of stock so held was £4,175,634, distributed over 46,993 persons. Under regulations of 1888 the minimum amount of stock purchasable was reduced from £10 to £5. See Savings-banks.

Government Insurances and Annuities.—An Act 27 and 28 Vict. chap. 43, 1864, empowered the postmaster-general to grant life-insurance policies and annuities within certain limited amounts; and the scheme was in operation from the 1st April 1865. These branches of business have not developed beyond very narrow limits, and, in so far as the scheme may have been devised to make life insurance and the buying of annuities on the part of the less well-to-do more general, the attempt has hitherto been a failure.

Post-office Telegraphs.—Prior to 1870 the business of conveying telegraphic messages for the public was in the hands of several rival telegraph companies and the railway companies; but by the Act 31 and 32 Vict. chap. 110, 1865, the postmaster-general was authorised to acquire, work, and maintain electric telegraphs; and by Act 32 and 33 Vict. chap. 73 he acquired (with certain exceptions) the exclusive privilege of sending telegraphic messages within the kingdom. The actual transfer of the working system took place on the 6th February 1870. The tariff was, like the inland postage, a uniform tariff within the United Kingdom, the minimum charge being 1s. for twenty words, with free addresses. In the first complete year of the new management (1870-71) the total number of telegrams transmitted was 850,177. On the 1st October 1885 the minimum charge for a telegram was reduced to 6d. for twelve words, addresses ceasing to be sent free. In the year 1889-90 the number of messages transmitted was 62,403,299. The total sum laid out as capital in connection with the purchase of the telegraphs was £10,880,571; and the annual interest on this sum, 1889 was £299,316, is now borne on the post-office votes. In the year 1888 the number of telegrams was 68,810,786, and the revenue, £2,130,973. The number of offices for postal telegraph business in 1898 was 8175 (see Telegraph). The post-office had also in 1899 53,000 miles of telephone trunk-wires, and connections with the National Telephone Company of the United States.

Parcel Post.—This is the most recent of the greater undertakings entered into by the post-office. By the Post-office (Parcels) Act, 1882 (45 and 46 Vict. chap. 74), the post-office was empowered to convey parcels by post on different conditions from the ordinary post. The object was to give the railway companies for the conveyance of the parcels in bulk being fixed at eleven-twentieths of the gross inland postage received for the parcels, the post-office performing all duties of collection and delivery. This business was entered upon by the post-office on the 1st August 1883, the parcels conveyed being exclusively inland parcels. At the outset the maximum weight of a parcel was fixed at 7 lb. On the 1st May 1886 the maximum weight was raised to 11 lb., and an alteration made that the extra charge for a parcel of 11 lb. being fixed at 1s. 6d. In the 33rd year of the parcel post the number of parcels transmitted was upwards of 22,900,000. On the 1st July 1885 parcel business was extended to certain of the colonies and to foreign countries, and from year to year this connection was further extended. In the year ended 31st March 1890 the total number of parcels of all kinds delivered in the United Kingdom was 42,852,570, the gross postage upon which was £392,113. This vast system of parcel carriage is said not to have damaged the business of the parcel business of the railway companies, and consequently it must be held to be a new convenience created for the public, the value of which it is impossible to estimate.

Inland Revenue Licenses.—Through the medium of the post-office the inland revenue department finds a ready means of issuing a great variety of licenses throughout the country. In the year ended the 31st March 1890 the number of licenses so distributed was 1,518,136, representing a sum of £200,183.

Mail-packet Service.—Occasional reference is made in old writings, and in official records, to the employment of vessels called packets, for the conveyance of the mails, but there seems hardly any continuous account of the services performed by those vessels. In the time of Charles I. regular mail communication between Dublin and Chester, and between Milford Haven and Waterford, conveyed government despatches, and in 1600 one Nicholas Herbert agreed to have his barque in readiness at Whitehaven, with one sufficient master, and other meet and able sailors, to carry letters for His Majesty or the council at Dublin for £10 per lunar month. It would seem that for some time anterior to 1788 the packets belonged either to the crown, to members of the post-office staff, or to their friends, for in that year a commission upon fees of public offices recommended this system should be done, and that contracts should be obtained by public advertisement. The recommendation was, however, only partially acted upon at that time, and no public contracts were entered into, apparently, until after 1857, at which period the packet service was placed under the control of the Admiralty. Another committee in 1848 strongly urged an extension of the contract system, and a similar recommendation was made by Lord Canning's Committee of Inquiry into packet-contracts in 1853. This committee also recommended that the stipulation as to the arming of the packets
should be omitted in future contracts, and the committee's views in this matter were then given effect to. The mail-packet contract business remained in the hands of the Admiralty till the 1st April 1800, when the whole management was taken over. In order to effect rapidity and regularity of service, it has been necessary from time to time to grant vast subsidies to the mail-packet contractors, in those cases where the exigencies of trade had not secured those conditions; but the growth of finances and gradual emancipation has enabled the post-office in many cases to obtain easier terms. At the close of the 17th century a mail-packet was a vessel of some 85 tons, and in the last years of the 18th century a mail-packet on the Falmouth station, reckoned fit to proceed to any part of the world, was one of about 179 tons. The packets at this time sailing to and from the Continent were of about 70 tons or thereabouts. About 1840 packets performing the American service were vessels of about 400 or 500 tons burthen. Steam-vessels were first employed in the British mail service in 1849, and since then vast strides have been made both in the speed and carrying capacity of these ships. The British mail-packets are to be seen in almost every sea on the globe. For the Atlantic service steemers of from 7000 to 10,000 tons are employed, making the transit of this ocean in 6 days. So late as 1829 the time allowed for a packet trip to and from America was 105 days. The contract services at home are very numerous, and those to foreign stations are almost co-extensive with the high seas. In the year 1889-90 the total payment made by the post-office for packet services was £665,375, full details of which will be found in the post-master-general's annual report.

Rates and Regulations.—In the scope of an article like this it is impossible to review the past rates of postage and changes of regulations that have taken place from time to time. The conditions applicable to the business in relation to the public will be found fully set forth in the Post-office Guide, which may be consulted at any post-office, and to which the reader is referred.

Staff.—The highest authority in the post-office is the postmaster-general. This officer is a member of the government, a privy-councillor, and sometimes a cabinet minister. All important measures of administration, appointments of officers, and dismissals are passed under the authority of the postmaster-general in the form of minutes. This department also includes the secretaries, a financial secretary, four other secretaries in London, a surveyor-general in Scotland, and a secretary in Ireland. The several secretaries under the first secretary take charge of separate branches of post-office business. Another important officer is the receiver and accountant-general. This officer is responsible for the whole vast accounting work of the post-office, the collection of its revenue, and the distribution of its expenditure. He has no power, however, except by effecting economies of work or reform of method, to reduce the latter or to increase the former. The laws of revenue and expenditure are fixed by higher authority. The total number of persons employed by the post-office (1890) is 113,560. Of these 61,054 are established officers, and 52,496 unestablished and persons not given to the public. The total number of employees comprises 89,373 males and 24,177 females. The salary of the postmaster-general is £2500 per annum, and of the chief-secretary a maximum of £2000. On a change of government the postmaster-general demits his office.

Espionage of Letters.—The post-office statute of Queen Anne contains a prohibition, repeated in subsequent acts, against letters being opened or detained by persons in the service of the post-office, except under a warrant from one of the principal secretaries of state. During the 18th century such warrants were often granted upon very trivial pretexts. At Bishop Auckland Addressing, 1272 copies of his letters, intercepted in the post, were produced as evidence against him; and it would seem that about 1735 a system was kept up at immense expense for the examination of home and foreign correspondence. In 1782 the correspondence of Lord Temple, then the lord-lieutenant of Ireland, was subjected to such treatment in the post. The 19th century brought a change for the better in this respect, and in 1806 Lord Spencer initiated the custom of recording the dates of all warrants granted, and the grounds upon which they were issued. Since 1892 the warrants have been preserved at the Home Office; and a House of Commons return in 1833 shows that, in the preceding ten years, only six letters were detained and opened,—four in cases of felony. When Sir Robert Peel introduced the Penny Post, in 1840, a warrant was issued for the arrest and opening of the letters of Mazzini, the matter contained in them being conveyed to the Austrian minister. This act involved the government of the day in serious public obloquy, and produced a widespread, though groundless, disturbance. The postmaster-in-chief may make regulations for the destruction of intercepted letters, subject to the ordinary correspondence of the country. It may safely be held that this power of opening letters in the post has been very rarely exercised in recent years.

Dead-letter, or Returned-letter Office.—A department of the post-office appointed to deal with letters, books, newspapers, &c. which cannot be delivered to the persons to whom they are directed. When a letter or other postal packet is refused at the address which it bears it is kept by the post-master, if an inland letter, &c., one day, and if a colonial or foreign letter, &c., three days, before being sent to the returned-letter office. Inland letters are here opened, and those which contain the writers' addresses are at once returned to them; while those which furnish no indication of the addresses of the senders, and contain nothing of value, are immediately destroyed. The number of the senders' addresses on the outside, in the form of medalion or otherwise, are, however, usually returned without being opened. Foreign and colonial letters, after being retained from one week to one month, are returned unopened to the country of origin. The secretary is directed to suppress all letters found to contain value. In the year 1889-90 the following numbers of articles were received in the various offices constituting this department: letters, 63,311,102; post-cards, 841,076; book-packets (including circular-letters passing at book-post rates), 6,661,201; newspapers, 531,022; patterns, 27,488; parcels, 167,583. Of the letters 119,386 were re-issued to corrected addresses, and 5,359,551 returned to the senders, while 214,859 were returned unopened to foreign countries. Of the total parcels received 81,277 were either re-issued to corrected addresses or returned to the senders. The returned-letter department has not only principal offices in London, Edinburgh, and Dublin, but branch offices in the other more important towns.

Offices of the Post-office.—In view of the vastly important services rendered to the public by the post-office, involving the imposition of great responsibility upon its officers, and of the necessity which obviously exists for the protection of the revenue (the conveyance of letters being a matter of monopoly), it is thought fit to pass special enactments for the regulation of the one and the safeguarding of the
other. In addition, enactments have been passed from time to time bearing upon the other branches of post-office business. The following are some of the offences recognised in the enactments:

Every person employed by or under the post-office who steals, secretes, or destroys a post-letter is guilty of felony, and if it contain a chattel or money the punishment is death 

Every person who posts letters or other postal packets out of the customary office or its officers are likewise guilty of felony, and similarly punishable; and a person who fraudulently retains or willfully keeps or detains a letter or other postal packet delivered to him by mistake, or for any other reason from which he may have found, is punishable by fine and imprisonment. The moment a letter or other postal packet is put into the post-office, or is delivered to a person authorised to receive such missives for the post, the protection of the statute commences, and it ceases on the letter being delivered at the place of its address. If a postman delay the delivery willfully, or if an officer of the post-office disclose or intercept or willfully delay a telegraphic message, he commits a misdemeanor of the post-office or the contents stolen or taken from the post-office are guilty of felony. By the 1 Vict. chap. 36 sect. 2, any person sending or conveying otherwise than by post letters or packets not exempted from the exclusive privilege of the postmaster-general, or persons not entitled or authorised to send letters or parcels, or persons who, being otherwise entitled, are liable by reason of their own breeding or manner of life, are, or are by the same or any other means, by any means liable at the discretion of the postmaster-general, or if such persons send letters or packets which are not conveying letters or packets from place to place, is liable to a penalty of £5 for every such letter or packet. This exclusive privilege or monopoly does not extend to newspapers. There are, however, exceptions to the general rule as regard post-office packets. Thus, articles of conveyance are, in course of conveyance by a private friend and not by the post-office. Letters sent by messengers on purpose, on the private affairs of the sender or receiver, commissions and legal letters, letters of merchants sent by their own vessels or along with goods to which they relate, and likewise excepted. But no person is permitted even to collect these excepted letters for the purpose of sending them in the manner described, for this is infringing the exclusive privilege of the post-office. Moreover, certain persons are by the statute, carrying letters even gratuitously—viz. common carriers unless the letters relate to goods in their carts or wagons; owners, masters or commanders of ships, except letters of the owners of the ships or such as relate to goods on board; and passengers or other persons on board any ship, or on any lines or roads on a postal order as well, in the case of a cheque, or knowingly offers, utterers, or disposes of any order, with such fraudulent oblation, addition, or alteration, is guilty of a felony, and is liable to the like punishment as if the order were a cheque. By the Act 45 and 46 Vict. chap. 74, relating to the parcel post, that act is to be deemed to be a post-office act within the meaning of the Post-office Acts (Money Orders) Act, 1837. This, however, subject to its provisions. The Post-office Acts apply to parcels in like manner as they apply to other postal packets. Act 47 and 48 Vict. chap. 76 —the Post-office (Protection) Act, 1834—deals with a variety of offences under the following heads: prohibition of affixing baneful designs against post-office letter-boxes; prohibition of sending by post explosive, dangerous, or deleterious substances, or indecent prints, words, &c.; prohibition of affixing placards, notices, &c. on a post-office, letter-box, or other post-office property; prohibition of imitation of post-office stamps, envelopes, cards, forms, and marks; prohibition of fictitious stamps; prohibition of false notice implying that any place is a post-office, postal telegraph office, or post-office letter-box: obstruction of officers of the post-office in the discharge of their duties; obtaining of clothing by officers of the post-office on ceasing to be officers; forgery and improper disclosure of telegrams. Contraventions of these prohibitions entail penalties generally ranging from twelve months' imprisonment with hard labour, or a fine of £2, or both; and the service charges on letters greater than £1 are 5s., and on newspapers..

Foreign Post-office Systems.—The advantages of the post are now enjoyed, in a greater or less degree, by all civilised countries; and the several systems bear in their main features a general resemblance to the British system, upon which, in many cases, they have been modelled. At the same time details of marked difference may be observed, each country having adapted its system to its own particular wants. Thus, in certain countries subscriptions to the newspapers and accounts for merchandise are collected by the post-office; the parcels post conveys larger and heavier articles than are conveyed in Great Britain; a system of sending through the post letters of declared value is in force in some; and a different means is employed for transferring mails to and from mail trains while running. Besides a classification of the goods sent in regard to rates of postage is not uniform. The amount of matter conveyed through the post between Great Britain and certain foreign countries is enormous—e.g. the average number of sacks of mails despatched weekly in 1839 from the United States was 1200, and to the Australian colonies 410.

United States.—The beginnings of a postal service in the United States date from 1639, when a house in Boston was employed for the receipt and delivery of letters for or from beyond the seas. In 1672 the government of New York colony established 'a post to goe monthly from New York to Boston;' in 1702 it was changed to a fortnightly one. A general post-office was established and erected in Virginia in 1692, and in Philadelphia in 1693. A deputy postmaster-general for America was appointed by an act of the Pennsylvania legislature in 1710 (see p. 347) he was directed to keep his principal office in New York, 'and other chief offices in some convenient place or places in other of Her Majesty's provinces or colonies in America.' The monopoly was established which included also the transport of travellers, and a tariff was fixed. The system, however, proved a failure, until 1753, when Benjamin Franklin became postmaster-general; when he was removed from office in 1774 the net revenue exceeded £3000.

In 1789, when the post-office was transferred to the new federal government, the number of offices
in the thirteen states was only about seventy-five. A conception of the remarkable progress in the ensuing century is supplied in the table below. Outstanding events in the history of the American postal service have been the negotiation of a postal treaty with England (1846), the introduction of postage-stamps (1847), of stamped envelopes (1852), of the system of registering letters (1855); the establishment of the free-delivery system, and of the travelling post-office system (1863); the introduction of the money-order system (1864), of post-office carts (1873), and, between the last two dates, of stamped newspaper-wrappers, and of envelopes bearing requests for the return of the enclosed letter to the writer in case of non-delivery; the formation of the Universal Postal Union (1873); the issue of "postal notes" payable to bearer (1883); and the establishment of a special delivery system (1885), under which letters bearing an extra ten-cent stamp are delivered by special messengers immediately on arrival at the post-office of destination. Later progress is found in the rapidly-growing system of free rural delivery, and in the extensification of domestic rates to the island possessions. The postmaster-general is a member of the cabinet. Under him about 100,000 persons are employed, of whom some 60,000 are postmasters. Most of these, except letter-carriers and clerks, are selected from the list of the post-office with a view to filling the office of a new political party. The following table shows the increase, during the first century of the department's history, in offices, length of mail routes in miles, revenue, &c., with figures for 1898.

As will be seen, the United States post-office department, unlike that in Great Britain, is carried on at a loss; this is due to the large amount of postal matter of certain classes carried at less than the cost of distribution, and to some kinds of correspondence carried free. In 1898 there were 12,325,703,000 pieces of mail and packages, 15,416,892 registered and parcel post, 1,061,416 through registered pouches, &c. In 1890 there were conveyed by post:

- Letters, post-cards, &c. | 2,289,550,015 |
- Newspapers, &c. | 776,425,415 |
- Other mail | 310,247,199 |
- Articles sent free of postage | 370,569,165 |
- Articles of all kinds for foreign countries | 41,273,812 |

Grand total: 4,005,400,206

The number of post-offices in the United States is larger than in any other country; but as regards the number of persons employed the United States takes third rank. It provides a post-office for every 1003 persons, while in Great Britain the proportion is one to every 2165 persons.

See the articles STAMPS, TELEGRAPH. The following works may also be consulted: Postmaster-general's Annual Reports, issued yearly since 1835; Her Majesty's Message by Sir H. B. S. Hume, "The History of Penny Postage," by Sir R. H. and G. H. B. St. George (1890); Fifty Years of Public Work, by Sir Henry Cole (1884); The History of the Post-office to 1856, by H. Joyce (1901); The Post-office, by F. C. Baines (1886); The Royal Mail (1835), and The Post in Great Britain (1881), by the present writer.

POTASSIUM

Potash Water. See AERATED WATERS.

Potassium (sym. K. equiv. 39) is one of the alkaline metals. The letter K is selected as its symbol, being the first letter of Kali, the Arabic word for potash, the letter P has been in vain attempted to be derived from the Greek polemos, war. The following are the chief characters of this metal. It is of a bluish-white colour, and presents a strong metallic lustre. It melts at 146° 5' (62° 5' C), and at a red heat is converted into vapour. Its affinity for oxygen is so great that on exposure to moist air it immediately becomes covered with a film of oxide, and hence it must be kept below the surface of maphtha. When heated it burns with a violet flame. Its intense affinity for oxygen is well shown by throwing it into water, on which, from its low specific gravity, 1.05, it floats. The metal abstracts oxygen from the water, and forms oxide of potassium (potash); while the liberated hydrogen carries off a small portion of the volatilised potassium, and, taking fire from the heat evolved by the energetic chemical action, burns with a brilliant flame. Its chemical affinities are extraordinarily varied. Of all the metals, none more resemble it than the alkali metals; the burning metal swimming about rapidly on the water, and finally disappearing with an explosion of steam, when the globule of melted potash becomes sufficiently cool to come in contact with the water.

Potassium does not occur in the native state, and can only be obtained by the reduction of its oxide, potash. In 1807 Davy prepared it by decomposing its hydrated oxide (potash) by means of a volatile current, but this process is not applicable on the large scale. It is now usually manufactured by dissolving a mixture of carbonate of potash and charcoal in an iron retort.

If proper proportions are taken, the mixture is wholly converted into carbonic oxide and potassium, as is shown in the equation:

K₂CO₃ + 2C = K₂ + 3CO

Potassium forms two compounds with oxygen, viz. a protoxide, KO, which constitutes potash, and is strongly basic, and a peroxide, K₂O₄, of these the former is the one of most importance. Potash is procured in the anhydrous form by heating thin slices of the metal in air perfectly free from moisture or carbonic acid. It is white, very deliquescent, and caustic. When moistened with water it becomes incandescent, and the water cannot be expelled by any means. The most important substance is the Hydrate of Potash or Caustic Potash (KOH = K₂O₂H₂O). This is commonly prepared by dissolving carbonate of potash in ten times its weight of water, and gradually adding to the boiling solution a quantity of skewled lime, equal in weight to half the carbonate of potash used. The resulting compounds are carbonate of lime, which falls as a precipitate, and hydrate of potash, which remains in solution; the changes being expressed by the equation:

K₂CO₃ + Ca(OH)₂ = CaCO₃ + 2KOH.

The clear supernatant fluid is removed by decantation, or by means of a sjolin, into a clean silver or iron vessel, heated until it flows tranquilly like oil; it is then either cast into cylinders in metallic moulds, or is poured upon a cold slab, and solidifies on cooling. As so obtained it is very impure, but by solution in alcohol and evaporation a very pure article may be produced.

Hydrate of potash, on solidifying after fusion, occurs as a hard, grayish-white, opaque body, with a crystalline fracture, which may be readily again fused into a colourless oily fluid, but which only
volatilises at a very high temperature. It is soluble in about half its weight either of water or of alcohol, and rapidly absorbs both carbonic acid and oxygen. It leaves a thin less soluble than a powerful emetic, and quickly destroys both animal and vegetable tissues, and hence its solutions can only be filtered through asbestos or pounded glass or sand. Its affinities are so powerful that few vessels can stand its reaction upon test-paper. Its solution must be preserved in glass bottles into the composition of which no oxide of lead enters, as it has the property of dissolving this oxide out of the glass. Vessels containing silica (porcelain, earthenware, &c.) are decomposed, and platinum itself is oxidised when heated in contact with it.

The salts which potash forms with acids are for the most part readily soluble in water, and colourless, unless (as, for example, in permanganate of potash) the acid is coloured. Most of them are crystallisable, and they all communicate a light tint, characteristic of potash, to the flame of spirit of wine and to that of the blowpipe. Many of them occur in animals and vegetables, and the ashes of plants contain them in large quantity.

Carbonate of Potash, $\text{K}_2\text{CO}_3$, is obtained by burning in a blowpipe the ashes of plants and bones washed in water, evaporating till the sulphates, chlorides, &c. separate in crystals, and then boiling the mother liquid to dryness in iron pots. The quantity of pure carbonate of potash contained in it is liable to great variation, and for pharmaceutical purposes it must be dissolved in water and crystallised in a vessel in which the crystals containing about 20 per cent. of water. Carbonate of potash is extremely deliquescent, and is soluble in less than its own weight of water, but is insoluble in alcohol. It has an acrid, alkaline taste, and is closely similar to the alkaline earths, and it is a compound of great importance, both as a chemical reagent and as entering largely into the preparation of most of the other compounds of potash, and into the manufacture of soap and glass.

The commercial carbonate is often called Pearl Ashes. Bicarbonate of Potash, $\text{KHCO}_3$, is obtained in white rhombic prisms, by passing a current of carbonic acid gas through a strong solution of carbonate of potash. These crystals are permanent in the air, but are decomposed by heat; water and carbonic acid being evolved, and the simple carbonate of potash being left. The crystals of the carbonate, requiring four parts of cold water for its solution, which is nearly neutral to test-paper, and has a much milder taste than the preceding salt. It is employed as an antacid in medicine. The Sulphate, $\text{K}_2\text{SO}_4$, and Thiosulphate, $\text{KHSO}_3$, may be prepared by treating potash with sulphuric acid. Nitrate of Potash has been already described under the head Nitre. Chlorate of Potash, $\text{KClO}_3$, occurs in white rhomboideal tablets of a nearly lustre. It has a cooling taste like that of nitre. It fuses at a gentle heat without decomposition, but on increasing the heat it gradually gives off all its oxygen, and is converted into chloride of potash, according to the equation:

$$2\text{KClO}_3 = 2\text{KCl} + 3\text{O}_2$$

It is not very soluble, as it requires for solution 16 parts of cold and 1-7 parts of boiling water. It even surpasses nitrate of potash as an oxidising agent; and if combustible substances, such as carburets of carbon in the presence of air, be heated in a test-tube, or be forcibly rubbed with it, a detonation or explosion occurs. This salt is employed in the manufacture of Matches (q.v.), in certain operations in calico-printing, and for filling the friction-tubes employed for firing cannon: the best mixture for these tubes consists of 2 parts of this salt, 2 of sulphide of antimony, and 1 of powdered glass. A mixture known as White Gunpowder, consisting of chloride of potash, dried ferrocyanide of potassium, and sugar, has been employed for illuminating matches, but its preparation is accompanied by so much danger that it is seldom used. This salt does not occur as a natural product, but may be obtained along with chloride of potassium by passing a current of chlorine gas through a hot solution of caustic potash. The two salts can easily be separated by crystallisation, as the chloride is comparatively insoluble, and the chloride extremely soluble. Hypochlorite of Potash can only be obtained in solution. Under the title of Eau de Javelle, it is sold as a bleaching agent. It is obtained by passing chlorine gas through a cold dilute solution of carbonate of potash, when chloride of potassium and hypochlorite of potash are formed, from which the chloride may be removed by crystallisation. The Phosphates of Potash, formed by the different varieties of phosphoric acid, are sufficiently noticed in the articles PHOSPHORUS and MANURE.

The Silicates of Potash are important compounds in connection with the manufacture of glass; they also enter into the composition of Fuchs's Soluble Glass (see GLASS), or Water-glass, and have been employed for bleaching purposes. The sulphides of magnesium and other limestones may be prevented. The Chromate and Bichromate of Potash are noticed in the articles CHROMIUM and CARBONIC ACID.

The limpid salts of potash may be passed on very briefly. The Chloride of Potassium, $\text{KCl}$, is prepared by boiling a large quantity in the preparation of chloride of potash, or may be procured by burning potassium in chlorine gas, when the result of the brilliant combustion which takes place is this salt. In its general character it is closely similar to common salt, $\text{NaCl}$, except that the former communicates a violent sensation to the latter a yellow tint to the flame of alcohol. It is a constituent of sea-water, of salt marshes, and of many animal and vegetable fluids and tissues. The Bromide and Iodide of Potassium are noticed in the articles BROMINE and IODINE.

Fluoride of Potassium, $\text{KF}$, possesses the property of cornding glass. There are several sulphides, the most important being the Liver of Sulphur, prepared by fusing together carbonate of potash and sulphur. Besides its use in skin diseases, it is much employed for bleaching purposes, and gives a violet colour to the latter a yellow tint to the flame of alcohol. It is a constituent of sea-water, of salt marshes, and of many animal and vegetable fluids and tissues. The Bromide and Iodide of Potassium are noticed in the articles BROMINE and IODINE. The Cyanide of Potassium, $\text{KC}($, may be obtained commercially by fusing together 3 parts of ferrocyanide and 3 of carbonate of potassium. This salt forms colourless deliquescent crystals very soluble in water. It exhauses an odour of hydrocyanic acid, and is nearly as poisonous as that acid. Its great deoxidising power at a high temperature renders it a valuable agent in many of the finer operations of metallurgy, and in a dilute solution, it is a solvent for natural gold, and is used (the 'cyanide process') for the profitable treatment of low-grade free-milling ores, in which the gold occurs in fine particles, not otherwise utilisable.

The following are the ordinary tests for the potassium compounds: (1) Some of the solution is added in excess to a moderately strong solution of a potassium salt gives after some time a white crystalline precipitate of cream of tartar (see TARTARIC ACID). The result is hastened by stirring or shaking. (2) The same salt gives a crystalline yellow precipitate, which is a double salt of bichloride of platinum and chloride of potassium. If not previously acid, the mixture to be tested should be acidulated with hydrochloric acid. (3) The violet tint occurring in the presence of potassium in the outer flame of the blowpipe,
or in the flame of spirit, has been already noticed. (4) The spectrum of a flame containing potassium exhibits a characteristic bright line at the extreme limit of the red, and another at the opposite violet limit of the Spectrum (q.v.).

In medicine the following compounds are used: Carbonate of Potash, or Hydrate of Potash, KOH, which occurs in it, and is employed in its pure form in dissolving the animal tissues, it is sometimes used as a caustic, although its great deliquescence renders it somewhat difficult to localise its action to the desired spot. In bites of venomous serpents, mad dogs, etc., it may be applied with advantage, and it is useful in destroying warts and fungoid growths of various kinds. Solution of Potash, commonly known as Liquor potassse, is obtained by the process already given for the preparation of hydrate of potash. Liquor potassse, in combination with a tonic infusion, is of service in cases of dyspepsia which are accompanied with excessive acidity of the stomach, such, for example, as often occur in habitual spirit-drinkers. It is also frequently given with the view of rendering the urine alkaline, or of diminishing its acidity in cases in which that secretion has need of it. The use of potassse gradually increased to as much as a fluid drachm. Acetate of Potash, KC,H,0, is obtained by the action of acetic acid on carbonate of potash, and occurs in white foliaceous salty masses. In its passage through the system it is converted into carbonate, and thus renders the urine alkaline. In small doses, as from a scruple to a drachm, it acts as a diuretic, and is of service in some forms of dropsy. Combined with other potass-salts, it is much given in acute rheumatism. The two carbonates and the sulphurated potash have been already referred to.

The Chlorate of Potash has come much into use as a popular remedy for sore throats. For this purpose it is usually employed in the form of compressed pellets, which are allowed to dissolve slowly in the mouth.

Potato (Solanum tuberosum; see SOLANUM) one of the most important of cultivated plants, and in universal cultivation in the temperate parts of the globe. It is a perenniaI, having herbaceous stems, 1 to 3 feet high, without thorns or prickles; pinnae leaves with two or more pair of leaflets and pinnae. The flowers about an inch or an inch and a half in breadth, the wheel-shaped corolla being white or purple, and more or less veined, followed by globular, purplish fruit, of the size of large gooseberries; the roots producing tubers. The herbage has a slightly narcotic smell, although cattle do not refuse to eat a little of it, and the tender tops are used in some countries like spinach. The tubers are, however, the only valuable part of the plant. It was long customary to speak of the potato as a native of mountainous districts of tropical and subtropical America, but it has not been determined whether it is really indigenous, and where it has spread after being introduced by man. Humboldt doubted if it had ever been found truly wild; but subsequent travellers, of high scientific reputation, express themselves thoroughly satisfied on this point. It has been rendered certain that long before the Spaniards reached the New World the potato was cultivated by the Incas and other Andean nations. It seems to have been first brought to Europe by the Spaniards, from the neighbourhood of Cuzco, in the beginning of the 16th century, and to have spread from Spain into the Netherlands, Burgundy, and Italy, but only to be cultivated in a few gardens as a curiosity, and not for general use as an article of food. It is said to have been brought to England from Virginia by Sir John Hawkins in 1563; and, again, in 1568 by Sir Francis Drake, to whom indeed a statute, as the introducer of the potato, was erected at Offen- burg, in Baden, in 1538. Anyhow, it cannot have attracted much notice; and though Raleigh is believed to have planted potatoes both at his Devonshire birthplace Hayes, and on his Munster estates, it was a long time before they began to be extensively cultivated in England. It had become almost all Europe countries the same name with the Batatas or Sweet Potato (q.v.), which is the plant or tuber meant by English writers down to the middle of the 17th century in their use of the word potato. It was not until 1597, published in 1597, gives a figure of our potato under the name of Batata Virginiana; but so little was its merits appreciated that it is not even mentioned in the Complete Gardener of Loudon and Wise, published more than a century later, in 1719; whilst another writer of the same time says it is inferior to skirret and radish! It began, however, to be imagined that it might be used with advantage for feeding 'swine or other cattle,' and by-and-by that it might be useful for poor people, and for the prevention of famine. In 1659 the Duke of York's Commission for the Prevention of Famine in Ireland took up this idea, and in 1663 adopted measures for extending the cultivation of the potato, in order to the prevention of famines. To this the example of Ireland in some measure led, the potato having already come into cultivation there to an extent far greater than in any other European country, and with evident advantage to the people. From Ireland the cultivation of the potato was introduced into Lancashire about the end of the 17th century, soon began general there, and thence spread over England; so that before the middle of the 18th century it had become important as a field-crop, which it became in the south of Scotland some twenty or thirty years later, about the same time in Saxony and some other parts of Germany, but not until the later part of the century in some other parts of Germany and in France. In France the potato was long supposed to cause leprosy and fevers, and the extension of its culture was mainly due to the exertions of Parmentier (1778). In Prussia Frederick the Great took an interest in it, and promoted it by compulsory regulations. The potato has the most important as affording food both for human beings and for cattle; and next to the principal cereals is the most valuable of all plants for human food. It is also used for various purposes in the arts. No food-plant is more widely diffused; it is cultivated in subtropical countries, and struggles for existence in gardens, even within the Arctic Circle, yielding small and watery tubers, although the effects of late spring frosts, or early autumnal frosts, upon its foliage often prove that it is a plant properly belonging to a climate milder than that of most parts of Britain. A more familiar and poetic use than that of the potato has been its employment in the musical comedy of 'The Wish,' which was produced in 1846 and 1847 in Ireland and elsewhere from the failure of the crop. The results—due mainly to excessive and imprudent cultivation of the potato—confirmed two great laws, that the plants which live longest in soils cultivated in the same district, however successfully they may be cultivated for a time, are sure to fail at last; and that the exclusive, or almost exclusive, dependence of a people on one source or means of support is unfavourable to their welfare in respect to all their interests.
Humboldt calculates that the same extent of ground which would produce thirty pounds of wheat would produce one thousand pounds of potatoes. But though it degenerates, as it is accustomed to the wheel, and the constant employment of them as the chief article of food is not favourable to the development of the physical powers, and is consequently in its protracted influence unfavourable to mental energy, it is widely cultivated in Ireland, and the Highlands of Scotland, in a race capable of the highest development. It is calculated that 100 parts of good wheat-flour, or 107 parts of the grain, contain as much actual nutriment as 613 parts of potatoes. The inferiority of the potato in many respects, like the drills used in the corn, is compensated by a comparatively small quantity of nitrogenous substances which it contains, in consequence of which it is most advantageously used along with some very nitrogenous article of food, in Britain generally with animal food, in some parts of Europe with curds or with cheese. The potato tuber, in a fresh state, contains about 71 to 80 per cent. of water; 15 to 20 per cent. of starch, 3 to 7 of fibre or woody matter, 3 to 4 of gum, dextrine, and sugar, and 2 of albumen, gluten, and casein. There are considerable differences, however, in the proportion of these substances in different varieties, and in different soils and seasons.

Potatoes are used, both raw and boiled, for the feeding of cattle. For human food they are variously prepared by roasting or boiling, but now chiefly by boiling, a process by which they are freed from their starch, or a gummy and disagreeable matter, which the water in which potatoes have been boiled is wholly a wholesome.

The herbage or haulm of the potato has been used for making paper, but the results were not encouraging. Potato pulp produces a kind of cellulose paper, very like, or even superior to that from the morulae of the hydras. The berries yield by distillation a tolerable spirit.

The varieties of the potato in cultivation are extremely numerous—500 were exhibited at the Westminster Tercentenary Exhibition (1886). Any enumeration or classification of them is impossible. New ones are continually appearing, and old ones passing away. Those most advantageously cultivated in particular soils and climates are often found to thrive in these forms of ground which are small distances. Potatoes differ considerably in the character of their herbage—which is sometimes erect, sometimes straggling—and in the size and colour of their flowers, but are more generally distinguished by the size, form, and colour of their tubers, which are round, long, or kidney-shaped, white, red, dark purple, variegated, &c.

New varieties of potato are produced from seed; but potatoes are ordinarily propagated by planting the tubers, or cuttings of the tubers, each containing an eye or bud. Much has been written by gardeners and agriculturists on the comparative advantages of planting whole tubers or cuttings, but the latter method generally prevails.

Potatoes are planted in drills, made either by the spade or plough, or in couch beds, which are always made when the land is cultivated as arable land. The bases of potatoes are covered over with earth dug out of the alleys. The alleys serve, although imperfectly, for drains in undrained land. The cultivation of potatoes as a field-crop seems to have been first attempted in the Netherlands. They are still common in many parts of Ireland, but are now scarcely ever seen in England or Scotland. They are very suitable for strong, heavy, and somewhat moist land, and are profitably used in reducing some kinds of soil to cultivation, but are generally unsuitable for field-culture, owing to the expense of labour required. In strong, heavy land potatoes are cultivated in raised drills; in lighter and drier soils the raising of the drills is unnecessary. Manure is invariably given, with various and general artificial manures. Common dressings consist of from fifteen to twenty-five tons of dung per acre, with from five to ten cwt. of artificial manure, such as guano, dissolved bones, superphosphate, a little potash, and perhaps nitrate of soda or sal ammoniac. With Irish farmers the cultivation of potatoes, after they are planted, whether in the field or garden, consists chiefly in keeping the ground clear of weeds, and in earthing up the plants, to promote the formation of tubers. Potatoes are taken up by the fork, by turning over the drills, and by an implement specially designed for the purpose, known as a potato-raiser. Where the crop is grown extensively this implement is now almost universally used, and performs its work expeditiously and thoroughly.

Potato seed is forced in small boxes in which it is placed over winter, and from which it is taken in spring when it is twenty-five to thirty days in the ground, and planted in well-manured drills. Potato seed thus prepared may be dug about three weeks earlier than if the seed had not been sown.

The main field-crop is allowed to ripen thoroughly, and is capable of being stored for winter and spring consumption. This potato, however, is not be successfully practised in most parts of Britain before February or March, and in many seasons the later-planted are found as early as the earlier-planted, and more productive. The storing of potatoes is variously accomplished in dry lofts or sheds, in airy cellars or lofts, and in pits, which are sometimes holes excavated to a small depth in the earth, with the potatoes piled up above the surface of the ground, in a conical, or in a roof-like form, sometimes mere heaps of one or other of these forms. The potatoes are covered with straw and earth to keep out light and frost. Potato-pits should always be well ventilated by means of pipes or otherwise, as without ventilation the potatoes are apt to heat and sprout. Potatoes taken from the ground before they are quite ripe are extremely apt to heat and sprout. The potato crop is now an important one in almost all the rotations practised in Britain, although its cultivation is in most districts not quite so extensive as before its failure from the potato disease in 1845 and subsequent years, and farmers are more careful not to depend too much upon it. It very commonly succeeds a grain-crop, but sometimes is advantageously planted on land newly broken up from grass.

But, besides its value as a culinary vegetable, the potato is important in other respects. Its starch is very easily separated, and is in large proportions; hence it is cheaper than any other kind. It is manufactured on a very large scale. It is chiefly used in textile manufactories under the name of farina, which is converted into dextrine or British gum (see STARCH). In Holland and in Russia, where there is much difficulty in keeping potatoes through the winter, and there is consequently a necessity for using the crop quickly, large quantities of starch are made, and this is converted into sugar or syrup (see SUGAR). The refuse of the starch-manufactories is all utilised; it is pressed out from the water,
and used either for pig feeding or for manure. In the north of Europe much spirit for drinking is made from potatoes; it is called Potato-Brandy.

The potato is subject to several diseases, the chief of which is that serious fungous affection now commonly known as the potato disease. This disease was first observed in Germany; the earliest known outbreak of a grave character occurred at Liege in 1842. It broke out in Canada in 1844, and once proved very destructive. In the following year it made its appearance in the British Isles, having been first observed in the Isle of Wight. Its ravages in Ireland in 1846 and 1847 brought a terrible famine upon the small farmers of that country, and at frequent intervals since it has caused great losses in the potato crop.

It has been proved beyond doubt that a particular fungus always accompanies this peculiar and destructive disease. The point is still doubted by some, but it is now very generally believed that this fungus is the main cause of the disease. This mysterious fungus, Phytothornia infestans, runs through a strange life-cycle every year, and is by no means easily kept at bay. It is believed that except in temperatures below 40° and above 77° F., it is always present, ready to pounce upon a weak potato plant, and liable to develop into an epidemic should the climatic conditions be favourable to fungus-life. These conditions are damp, dull, calm weather, and a moist or wet soil, with a vigorous crop, vigorous stems, leaves, and tubers, especially after a crop which has been attacked by the disease; planting varieties which have been known to be exceptionally successful in resisting the disease; growing the potato crop under such general cultural, sanitary, and manorial conditions as will ensure to the fullest extent possible the healthy and vigorous development of the crop; careful selecting and storing of potatoes to be used as seed; and dressing the potato-tops, both before and after the appearance of the disease, with sulphate of copper. No certain preventive measures have as yet been discovered, but all these measures have been carried out with advantage. The discovery of the copper remedy is likely to be of great importance to potato growers. This is the mixture—about 3 to 6 parts of sulphate of copper and quicklime to 100 parts of water—which proved so efficient in combating the allied parasite fungus, Peronospora infestans, that attacks the vines, and there is good reason to believe that it will be almost equally successful in averting the potato disease. It is well known that a vigorous variety of potato is much better able to withstand a disease than one that is weak, and its healthy development is most successful in resisting the fungus. It is with the potato as with a human being— deprive it of wholesome food and healthy sanitary surroundings, and disease will speedily ensue. The prevalence of this particular disease in recent years is a sure indication of a deterioration in the constitutional vigour of the cultivated potato. The other diseases from which the potato crop is liable to suffer are Curit, Scab, Dry Rot, Wet Rot, and a fungus known as Puccinia potanae, all of which affect the foliage and general health of the potato-plant, and does not seem to be necessarily connected with the presence of any vegetable parasite or insect enemy.—Scab is a disease of the tuber, which becomes covered with brown, oblong, and finally confluent and circular spots, causing an offensive smell when the surface is powdered with minute olive-yellow grains, a fungus called Tuberculinus scalae, of the division Hyphomycetes.—Dry Rot is also ascribed to the growth of a fungus of the same order, Fuscoporia solani, and attacks the tubers either when stored in a dark, damp, or light, but not damp, atmosphere. It was first observed in Germany in 1830, and caused great loss in that country throughout many years. The tissues of the potato-tuber become hard-ened and completely filled with the mycelium

Section of potato leaf, lower surface uppermost, showing: a) hair of the plant; b) epidermal cells; c) hydride, or thread of the fungus Phytothornia infestans; d) tinea, conidia or dust spores; e) spores; f) spores breaking to liberate the conidiospores; g) anthereis or male portion, and h) oogonia or female portion, of a fungus in the central tissue of the leaf, but whether portions of the Phytothornia, as once asserted, or of another fungus, Pythium, is doubtful (Corduner's Chronicle, 1891).
of the fungus, which at last bursts forth in little cushion-shaped tufts loaded with fruiting-spores.—Wet Rot differs from dry rot in the tufts becoming soft and rotten instead of hard and dry, and is always characterised by the presence of a fungus referred to Fries to his genus Perioba, but which Berkeley regards as another form or stage of the same fungus which causes or is inseparably connected with dry rot. Both dry and wet rot have often been observed along with the potato disease, which, however, is always characterised by the presence of another peculiar fungus.—Peziza postuma has occasioned heavy losses, chiefly in Ireland, by destroying the leaves before the crop has matured. See books on potato-culture by Pink (1879), Cox (1880), Fremlin (1883), and Ward (1891), and on the potato-bleight by Bravender (1880).

Potato, Sweet. See Sweet Potato.

Potato-beetle. See Colorado Beetle.

Potato-fly (Anthomyia tuberosa), a dipterous insect of the same genus with the Radiish-fly, Cabbage-fly, Turnip-fly, &c. In its perfect state it is known, like the House-fly. The maggots are often abundant in bad potatoes in autumn, and are different from the maggots of the House-fly, being hairy, bristly, and tawny; the long tail ending in six long bristles. The pupa is very like the larva.

The Potato-fly (Anthomyia tuberosa):
1. Larva, or maggot, natural size; 2. larva magnified; 3. Potato-fly.

Curtis) and the caterpillar of the Death's-head Moth (Acherontis atropos, Linn.) feed on the leaves and stems of potatoes, but rarely do serious damage.

Potemkin, GREGORY ALEKSEDOVITCH, the most celebrated of the Empress Catharine II.'s favourites, was born near Smolensk on 16th September 1739, the descendant of a noble but impoverished Polish family. Having entered the Russian army, he managed (1762) to attract the notice of the czarina by his handsome face and athletic figure; he was attached to her household, and in 1774 was preferred as her recognised favourite. From 1776, when the Emperor Joseph of Austria made him a prince of the Holy Roman Empire, till the year of his death he was the director of the Russian policy in Europe. It was at his instigation that the khans of the Crimean put himself (1783) under Russian protection. Four years later Catharine paid a visit to his government in the summer of 1787, which he then played off on his sovereign is described by De Ségr (Mémoires). He caused an immense number of wooden painted houses to be constructed, and grouped into towns and villages along the route the czarina was to take, and hired people to act the part of villagers and the像ants, tradesmen, and agriculturists, engaged in their various pursuits. The czarina's vanity was hugely gratified at the seeming improvements of the country under her rule, and she covered Potemkin with titles and honour. Almost immediately after this a war broke out with the Turks, and Potemkin was placed at the head of the army, with Suwaroff as his subordinate. The latter was taken after a terrible siege, and Suwaroff won the great fights of Bender and Ismaili—which of all which Potemkin reaped the credit when he entered St. Petersburg in triumph in 1791. That same year he was seized with sudden illness whilst travelling between Moscow and St. Petersburg, and died on October 15, and was buried at Kherson. He was a man of considerable ability in court intrigue and statesmanship; his skill as a general has been both affirmed and denied. Personally he was licentious, coarse in his habits. and utterly tyrannical and unscrupulous; in spite of his lavish extravagance he heaped up an immense fortune.

See Memoirs (Lond. 1812), and the Life in German by his secretary Saint-Jean (new ed. Karlsruhe, 1888).

Potential, in dynamical science, is a quantity of peculiar importance. Its value, as a mathematical function of the theory of attraction, was recognised by Laplace in the Mécanique Cosmique. The name was, however, given by George Green (1793–1841) in 1828, when its broad dynamical significance was for the first time explicitly stated and powerfully developed. The theory of potential is capable of developing the dynamics of what are known as Conservative systems. When such a system is made to pass from one configuration to another, the work done against the forces of the system depends only upon the initial and final configurations, and in no way upon the particular series of changes by which the passage is made. For instance, the work done against gravity in lifting a given mass to a height of 500 feet is exactly the same whether the mass is lifted vertically up, by a balloon, say, or more laboriously taken up the character of the course taken. We know that the work so done is lost and cannot be recovered in dynamic form (see ENERGY). These forces are in short dissipative, and so far as their action is concerned the system is not conservative, and the theory of potential does not apply. Further consideration will show that when the forces are functions of distances only the system will be conservative. Such forces then have a potential; and, although this does not exhaust all types of conservative systems which have a potential, it includes all that are certainly known to occur in nature around us. The force of gravitation and the force between electrified or magnetised bodies evidently belong to the category just described. In all such cases the potential at any point in the field of force is a definite function of the position, a mathematical expression having for any particular case a definite value, such that the difference of the potentials of two points measures the work done in carrying unit quantity (of matter, electricity, magnetism, &c.) from one point to the other (see Ex hấpition). This will depend upon the character of the course taken. We know that the work so done is lost and cannot be recovered in dynamic form.
POTENTILLA

differentiation in any chosen direction gives the force in that direction. It is obvious that other directed quantities besides forces may be expressible as the differential coefficients of a single non-directed or scalar quantity. Thus, in the mathematical theory of Hydrodynamics (q.v.) a very important directed quantity is that of motion which have a velocity-potential and motions which have not. In the former the velocity can be represented by a space differentiation of a scalar quantity; in the latter it cannot. See Vortex for an account of fluid motion, which has no velocity-potential.

POTENTILLA, a genus of plants of the natural order Rosaceae, sub-order Potentillae, differing from Fragaria (Strawberry) in the fruit having a dry instead of a succulent receptacle. The species are very numerous, natives chiefly of northern temperate regions, and some of them the coldest north; most of them perennial herbaceous plants, with yellow, white, red, or purple flowers, and pinnate, digitate, or ternate leaves. They are often called Cinquefoil (Fr., ‘five-leaved’); and some of the species are favourite garden flowers. A few are natives of Britain; one of the rarest of which is a shrubby species (P. fruticosus), forming a large bush, with pinnate leaves, and a profusion of yellow flowers, often planted in shrubberies. P. reptans, a common British species, with creeping stems, digitate leaves, and yellow flowers, once had a high reputation as a remedy for diarrhea, from the astrigent property of its root, of which most of the species partake with it. But P. anserina, a very common British species, popularly known as Silverweed, having creeping stems, yellow flowers, and pinnate leaves, which are beautifully silky and silvery beneath, has an edible root, with a taste somewhat like that of the parsnip. Swimmers may grab it up with avidity, and it was once much esteemed as an article of food in some parts of Scotland, particularly in the Hebrides, where it abounds and has been a resource in times of famine.

The name potentilla is said to be derived from the Latin potentia, powerful, or able to manifest virtual power. Tormentil (q.v.) is sometimes referred to this genus.

Potencia (anc. Potentia), a town of South Italy, ensconced in a valley of the Apennines, 103 miles E. by S. of Naples. It is surrounded by a wall, has a large and well-preserved fortification. Potencia was shaken by earthquakes in 1723, 1812, and 1857. Pop. 17,978.—The province of Potenza, called Basilicata until 1871, has an area of 3998 sq. m. and (1889) a pop. of 565,309.

Pot-herbs are not, as might be supposed from the name, the vegetables chiefly used for culinary purposes, as supplying articles of food; but rather those subsidiary in taste, and valued chiefly for flavouring, as parsley, fennel, &c.

Pot-holes. See GIANTS' KETTLES.

Poti, a seaport of Russian Caucassus, stands at the mouth of the river Poni, on the eastern shore of the Black Sea, 200 miles by rail W. of Tiflis. Here maize (£242,000), manganese (£85,000), &c. are shipped to the annual value of £300,000. The imports do not exceed £2500. Poti was seized by Russia in 1828. Pop. 3112.

Potidrea, a Corinthian colony founded on the westernmost isthmus of the Chalcidice peninsula in ancient Macedonia. By its revolt from the Athenian League (432 B.C.) it brought on the Peloponnesian war; it was besieged and taken by the Athenians (429 B.C.). The Athenian colony which was then settled there was destroyed by Philip of Macedon (356 B.C.). Cassander built up a new town, and called it Cassandria; this flourished greatly until it was captured and sacked by the Huns.

Pot-metal. Tap and pot metals are alloys of copper and lead. The proportions of the two metals vary from equal parts of each to 1 of copper and 10 of lead.

Poto mac, a river of the United States, formed by two branches which rise in the Allegheny Mountains in West Virginia, and unite 15 miles SE. of Cumberland, Maryland, from which point the river flows in a generally south-easterly course 400 miles, and falls into Chesapeake Bay, after forming a very nearly 100 miles long, and from 21 to 7 miles wide. The largest ships can ascend to Washington, and the tide reaches Georgetown. A few miles above Washington the river forms a catarract 33 feet high; and between there and Westport it falls more than 1000 feet. The scenery in this portion of its course is wild and beautiful, especially where it breaks through the Blue Ridge at Harper's Ferry. Its principal affluents are the Shenandoah, Cacapon, and Monacacy. The Potomac forms the greater part of the boundary between Virginia and Maryland.

Potoro, or Kangaroo Rat (Haplogrurus), a genus of the hopping, rabbit-like kangaroos. None of the species are larger than rabbits. They feed on roots, for which they dig with their fore-feet. Two other genera, Bettongia and Hopligrurus, are nearly related.

Potosi, capital of a department of the same name, and one of the most famous mining-towns of South America, stands in a barren and barren district, nearly 50 miles SW. of Chuquisaca. It is built on the side of the Cerro de Potosi (15,381 feet), at an elevation of 13,000 feet above the sea, and is thus one of the loftiest inhabited places on the globe. The town has a circumference of some 4 miles; but fully one-half is composed of tottering and ruined buildings, uninhabited and desolate, and the whole place, with its squalor, dilapidation, and dirt, presents a sinister aspect. The public buildings include a handsome cathedral and a mint which employs 200 hands; and the reservoirs are also worthy of mention. The streets are short and narrow, and there are no wagons or carriages, but only llamas and mules. The climate is very trying; all the four seasons may be experienced in one day, but usually it is bitterly cold, owing to the elevation and to the mountains all round, from which the snow nevercever melts. Yod-rapiches, card-shaves, &c. But it also, and originally, signifies a dish of different sorts of viands, and
POTSDAM, chief town of the Prussian province of Brandenburg, and second residence town of the royal family of Prussia, is situated on an island beside the lake-like river Havel, 18 miles by rail SW. of Berlin. It is a handsome city, with broad streets, public gardens, adorned with statues of Prussian sovereigns and fine squares. The royal palace (1667-1701), in the park of which are statues of Frederick-William I., Alexander I. of Russia, and Generals Blicher, Greisenau, Kleist, and Tauenzen; the town-house, a copy of that at Amsterdam; and the military orphanage are the finest of the public buildings. The Garrison church, with a steeple 290 feet high, contains the tombs of Frederick-William I. and Frederick II.; and the Friedenskirche the tombs of Frederick-William IV. and the Emperor Frederick III. The Brandenburg Tower {Tranjer's Tower} and the Neuer Turm of the immediate neighbourhood of the town are more than half-a-dozen royal palaces, as Sans-Souci (1745-47), the favourite residence of Frederick the Great, surrounded by a splendid park and gardens, containing Rauch's monument to Queen Louise and the palace of Friedelshack, formerly the New Palace (1763-70), with nearly 200 rooms, many of which contain costly works of art; Charlottenhof, built by Frederick-William IV. in 1820; the Marble Palace, the summer residence of the Emperor William II.; and Babelsberg, the private property of the same prince. Potsdam has an observatory, and a cadet and other military schools. Its manufactories produce sugar, chemicals, harness, silk, waxcloth, beer, &c. Flower-gardening, especially of violets, is a busy industry. Among other buildings in the palace grounds are the Pop. Garden, 53,727, opened by the Garrison church, 1800, including the Garrison church, 1800, which contains a creation as a town to the Great Elector, Frederick-William, and to Frederick II. Prior to that period it was a fishing-village, built on the site of an ancient Slav settlement. See German works by Kopisch (1864), A. R. (1883), and Sello (1888).

Potsdam Beds, a name given in North America to the uppermost division of the Cambrian or Primordial strata.

Potstone, Latpis Ollaris of the ancient Romans, a massive variety of tale-schist, composed of a finely-felted aggregate of tale, mica, and chlorite. It is generally of a grayish-green colour, sometimes dark green. It occurs massive, or in granular concretions. It is soft and easily cut when newly dug up, greasy to the touch, and insubstantial even before the blowpipe. It becomes hard after exposure to the air. It is made into pots and other household utensils, which communicate no bad taste to anything contained in them, and when greasy are cleaned by the fire. It was well known to the ancients; and Pliny describes the manner of making vessels of it. It was anciently procured in abundance in the Isle of Siphnos (Siphanto), one of the Cyclades, and in Upper Egypt. Large quarries of it were wrought on the Lake of Como, from about the beginning of the Christian era to 23th August 1618, when they fell in, causing the destruction of the neighbouring town of Pleurs, in which it was wrought into culinary greens, &c. It was carried to the Valais, Moravia, Norway, Sweden, Greenland, near Hudson Bay, &c.

Pott, August Friedrich, a great philologist, was born at Nettrelide in Hanover, 14th November 1802. He studied philology at Göttingen, habilitated at Berlin in 1830, and in 1833 became extraordinary, in 1839 ordinary professor of the Science of Language in the university of Halle. Next to W. Humboldt, Bopp, and Grimm, the name of Pott stands prominent in the new science of comparative philology. The fame of his researches was from the first secured by his Etymologische Forschungen auf dem Gebiet der Indogermanischen Sprachen (2 vols. 1833-36; & 2d ed. 6 vols. 1859-76), a work second in importance only to Bopp's Comparative Grammar. His work on Germanisch, in Ersch and Gruber's Encyklapdie, is a masterpiece of condensation, and for once of order. For his setting forth was a lack of order and perspicuity, which made Ascoli compare his books to the plain of Shinar after the confusion of Babel had taken place. But no student ever brought to his studies a loftier spirit of devotion, or collected more massive materials for the foundation of a new science. So thorough was his treatment that all the progress of learning since has not stripped the fragments from the foundations on which Pott's Names, on Numerals, his essays on Mythology, African Languages, or General Grammar. He died at Halle, 5th July 1887, working to the last.

Pottawattamies, a tribe of American Indians, belonging to the Algonquin stock. The early French settlers established a mission amongst them at Green Bay, and to this day many of them are Roman Catholics. They sided with the English both during the Revolution and in the war of 1812, and afterwards settled in Kansas, where one band of over 400 now live in houses and cultivate the ground. Another band, nearly 500 strong, is on a reservation in the same state, under the care of the Society of Friends.

Potter, John D.D., an English scholar and divine, the son of a linen-draper of Wakefield, in Yorkshire, was born in 1674, studied with great diligence and success at Oxford, where he took his degree of M.A. in 1694, and in the same year received holy orders. He was appointed chaplain to Queen Anne in 1706, professor of Divinity at Oxford in 1708, Bishop of Oxford in 1715, and finally in 1737 attained the highest dignity in the English Church—the archbishopric of Canterbury. He died 21st October 1747, and was buried at G oven. Potter's principal work is his Archologia Graeca ('Antiquities of Greece,' 2 vols. 1698), not superseded until the appearance of Dr W. Smith's Dictionary of Greek and Roman Antiquities; besides which, however, we may mention his edition of Lyceophone (1697) and of Cnossus Alexandrinus (1715).

Potter, Paul, the greatest animal-painter of the Dutch school, was born at Enkhuizen in 1625, and was the pupil of his father, Pieter Potter, a landscape-painter, with whom in 1631 he came to Amsterdam. He was also an excellent etcher, and possessed the most exquisite taste in his etched pieces, The Herdsman (1640, life-size), The Shepherdess (1642), and The Wood-Hawk (1643 and 1644 respectively. He established himself at the Hague in 1649, where next year he married the daughter of an architect, but in 1653 he returned to Amsterdam. He died there in January 1654 at the untimely age of twenty-nine. His
best pictures are pastoral scenes with animal figures, the life-size ‘Young Hull’ (1647, at the Hague) being especially celebrated. His ‘Dairy Farm,’ measuring only 19 by 48 inches, was sold in London on 27th June 1890 from the Stover collection for £6000, or £13 per square inch. The Rijks Museum at Amsterdam possesses several pictures of this ‘Dairy Farm’ and seven other pictures from his easel. Very many of his productions are preserved in England.

See P. Potter, an Vie et ses Oeuvres, by Van Westriëne (the Hague, 1867), and Cundall, Landscape Painters of Holland (‘Great Artists’ series, 1881).

Potters, The, a district in North Staffordshire which is 3 miles broad. The centre of the earthenware manufacture in England, includes Hanley, Burslem, Stoke-upon-Trent, Newcastle-under-Lyme, Tunstall, and other towns.

Pottery. This term, derived through the French poterie from the Latin pota, ‘a drinking vessel,’ is applied to all objects of baked clay. Pottery may be said to be almost contemporaneous and co-extensive with mankind; it is found with the earliest remains of the most primitive races, and it is fashioned amongst the rudest of present day tribes. The art in its rudimentary condition—merely moulding wet clay into the desired form, and submitting it to the hardening heat of the sun or of fires, in order to be rendered impervious to the least touch of savagery. The universality of the primitive art, and the many different lines along which it progressed, preclude the possibility of tracing its history in chronological sequence, and only a few of its more important developments can be traced historically.

Pottery as known at the present day is distinguished into many classes according to the nature and purity of the clay employed, the heat to which it has been exposed in firing, the glazes or enamels with which it has been covered, and the coloured or other ornamental treatment of its surface. Briefly, as regards material and baking it may be divided into (1) earthenware, which, exposed to a comparatively low heat, remains earthy in texture and can be scratched with a steel point; (2) stoneware, fired at a high heat, hard, dense, compact, and not scratched by the blade of a knife; (3) porcelain, fired at the highest temperature, semi-fused and vitreous in structure, and, when sufficiently thin, translucent. Earthenware again may be subdivided according to the manner in which its surface is treated, being either (1) plain, as in an ordinary flowerpot; (2) of Astbury, black surfaced pottery of ancient Greece; (3) glazed or coated with a transparent glass or varnish; and (4) enamelled or coated with an opaque white or coloured glass, which completely conceals the body over which it is spread.

Manufacture.—The dough-like condition into which clay can be worked with water, and the hardness and indestructibility it acquires by burning, are the qualities upon which the potter’s art essentially depends. Clay is one of the most metallic substances known, but it is of many qualities and degrees of purity. The commonest brick clays are so coarse in texture and so impregnated with iron and other foreign ingredients that they can be used only for bricks, tiles, and the very coarsest kinds of pottery. The purest potters’ clay, known as clays or kaolin (q.v.), is formed by the decomposition of granitic rocks. It consists essentially of the hydrated silicate of alumina with small proportions or trACES of one or more of lime, potash, soda, and magnesia. The finest china-clay of Great Britain is at Port Sunlight, Wirral, where it was discovered at Carlclaz, 2 miles N.E. of St Austell, between 1758 and 1758 by William Cookworthy.

Cookworthy’s discovery was of the utmost importance for the homoe manufacture of porcelain and fine pottery; and the development of the industry which took place under Josiah Wedgwood and others was due in no small measure to the fine material which thus became available to them. Commoner potters’ clay or pipeclay is obtained principally from Poole in Dorsetshire. The materials used for the paste or body of different varieties of porcelain and pottery are as follows: (1) Porcelain.—At Sévres, kaolin, 48 parts; sand (pure white), 48 parts; chalk, 4 parts. At Dresden, kaolin, 62 parts; flint, 38 parts; broken biscuit-porcelain, 2 parts. At Berlin, kaolin, 76 parts; telspar, 24 parts. In England three mixtures are used: for common china, ground flints, 75 parts; calcined bones, 150 parts; china-clay, 40 parts; clay, 70 parts. For fine china, ground flints, 66 parts; calcined bones, 160 parts; china-clay, 90 parts; Cornish granite, 80 parts. Fine, for modelling figures, &c., Lynn sand, 150 parts; calcined bones, 300 parts; china-clay, 100 parts; potash, 107 parts. The glazes require to be varied for nearly all, so that their fusibility may be greater or less, according to the more or less fusible character of the biscuit ingredients. (2) Stoneware, such as is used for jars, bottles, drain-pipes, &c., is made of several kinds of plastic clay, mixed with felspar and sand, and occasionally a little lime, but the materials vary much in different localities. (3) Earthenware. A labelled earthenware is made of various kinds of clay, varying in colour from yellow to white, according to the quality required; and more or less of powdered calcined flints are mixed with it, to give it body and hardness. Sometimes, as in porous vessels, only clay is used.

The use of calcined flint was first adopted by a Burslem potter named John Astbury, who in 1720 noticed the fine white character of a powder applied to the eyes of his horse for the cure of some ailment. He learned that the powder was made from calcined flint, and thereon he conceived the idea of using it in his pottery; and did so with great success. The ingredients, such as the clay and calcined flints, are prepared by separate means, the former in the pug-mill, which is represented as at C in fig. 1. This is an upright, iron-bound, wooden cylinder, with an axis, A, turned by machinery; projecting from the ceiling, as at D, are three arms, b, each of which has three knives fixed in it, with the points outward, and so arranged that they spread over the largest amount of space in the interior; and altogether they are placed in a spiral manner, that they may substitute in motion the clay, which is thrown in humps into the hopper-shaped upper part of the vat, is worked down, and is so cut and kneaded by the knives that it is forced out of the pug-mill in a state of soft pap. This is aided by the knives on the lower part of the lowest arm being connected together by a plate, D, which prevents all settlement at the bottom. This pap-like clay passes into a large wooden tank, in which it is agitated with water until quite incorporated, so as to resemble milk in colour and consistency. In another mill (fig. 2), of
a different construction, the Cornish granite and calcined flints are reduced to a somewhat similar state. This mill is very strongly constructed, and consists of a tub-like vat, A, in the centre of which turns an axle, B, moved by machinery; in the bottom of the vat is a thick stone-bed, C, consisting of either chert or horn stone. From the upper part of the axis three strong arms, D, D, D, project like the spokes of a wheel; and strongly attached to these are stout beams, a, pointing downward, and nearly touching the stone-bed, C. As the axis, with its arms and beams, turns round, the beams push some large masses of the Cornish granite or of chert stone round with them, and these triturate the calcined flints and other hard materials, and stir up the water with which the vat is kept constanty supplied, whilst it overflows in a milky state, charged with the finely-divided materials, into a cistern, where it is kept stirred until it is sufficiently supplied with the solid materials, and the thickened milky liquid is then drawn off, in proper proportions, into a vat to which the prepared clay is also passed. The mixture of the two is then allowed to subside until the water is nearly clear, when it is drawn off; and the sediment is deprived of its surplus moisture, either by evaporation, or, in the best works, by a pneumatic exhausting apparatus, which does it very quickly. The composition is then a fine plastic material of the consistency of tough dough, and is ready for the potter’s use. In preparing the finer materials for porcelain many other operations are required, all, however, having the same object—viz. the extreme minute division of the substances used.

The prepared clay is taken to the throwing-machine, or potter’s wheel, which is represented in fig. 3. This consists of a fixed table, A, through which passes the axle, B, and rises a little above its surface, and having on its upper end a disc, C, which revolves with it. The axle is put into rapid motion by turning the fly-wheel, D, either by hand or machinery; and this causes a rapid revolution of the disc, C, upon which is placed the soft mass of clay to be moulded. At E is seen an upright, with a small sliding-bar regulated by a screw; this is the guide for the potter to regulate the height of the vessel he is making. When the lump of clay is revolving, the potter, with his hands or with proper tools, fashions it into any rounded form he desires, gradually working from the base upwards till the vessel in his hands attains the external shape, height, and thickness of wall required. It is then put aside for some time to dry, and when in a state of greatest doughly tenacity it is fixed on a turning-lathe, and by means of sharp steel tools its surface is accurately turned and smoothed. But some articles are formed in moulds, the moulds being made of plaster of Paris. This answers well for fine porcelain intended to be very thin, because the plaster-mould absorbs much of the moisture in the paste, and thus partially dries it, so that it admits of handling, which in a softer state would be very difficult. The paste is used so liquid that it can be poured into the moulds. It is usual, in casting, to have a mould for each part, as seen in figs. 4, 5, 6, which represent the body, neck and lip, and foot of the creamer, fig. 7. The handle is also separately moulded, and attached with the aid of a fluid clay paste, called a slip. For nearly flat articles, such as dinner-plates, a plan is adopted which combines both processes: a mould, usually of plaster, fig. 8, a, is placed on the disc of the throwing-wheel, b, and a thin layer of the paste is pressed on to it, so as completely to take its form; then to the guide-post, c, is attached an arm, d, with a small brass plate,
heating of the pieces, and also protect them from smoke. A kiln has generally eight furnaces, and it is usual to raise six piles of seggars between every two furnaces, or rather between their flues, which rise to a considerable height in the kilns. Each pile of seggars is technically called a *bung*, so that there are generally forty-eight or fifty bungs to the charge of a kiln. When all this is arranged the furnaces are lighted, and great care is taken to

use the best coal, as it enables the manufacturer to make a more certain calculation as to its effects, and is less liable to smoke and sulphurous vapours, which might injuriously affect the contents of the kiln. The baking or firing usually lasts from forty to forty-two hours. The fire is then allowed to go out, and the kiln to cool very gradually, after which it is opened, and the seggars removed, to be unpacked in a separate workshop.

The articles are now in the state called biscuit-ware, and are ready for any pattern they may be intended to bear, and the glaze. Here, however, it may be stated that it is possible to glaze refractory pottery, such as stoneware in the biscuit oven, and

thus avoid the necessity for two firings to the ware. The glazing is in this case effected by throwing common salt into the oven when at its highest temperature. The salt is volatilised and the sodium separates from the chlorine, and, combining with the silica it finds in the heated ware, forms a
true soda glass with it, which makes a uniform transparent glazed layer over all the pottery surfaces which it reaches. In this way all glazed sanitary wares and ordinary stoneware jars and bottles are made at one firing. Common pottery is often figured by printing the desired pattern in enamelled colours on transfer-paper, and, whilst the printing is still wet, applying it to the biscuit-ware; the ware absorbs the enamel ink, and the paper is recovered by soaking the cloth in water, leaving the pattern on the ware. It is next fired in seggars, or a muffle, to fix the colour, and is then dipped into composition called glaze, of which three kinds are used in the Staffordshire potteries. The first, for common pipeclay ware, is composed of Cornish granite, 16 parts; flint, 30 parts; white-lead, 53 parts; and encault, or broken flint-glass, 4 parts. These materials are triturated with water, with the same care and by similar means to that employed in forming paste, and are reduced with water to the same milk-like liquidity. Each workman has a tab of the glaze before him; and as the articles of biscuit-ware, either with or without decorations, are brought to him, he dips them in the glaze, so as to ensure a uniform coating over them; and by nice management he prevents any large drops or accumulations on one part more than another. The porous biscuit-ware rapidly absorbs the moisture, and dries up the thin film on the surface of the articles, which are again placed in seggars, and carried to the glaze-kiln, where they undergo another firing, which melts the glaze, and converts it into a transparent glass all over the surface, and renders any pattern previously printed upon it very plain. The temperature in the glaze or enamel kiln is not increased very gradually, and is kept up for about fourteen hours, after which it is allowed to cool slowly, and the articles are taken out completed. So far, this description has applied to the manufacture of pottery and porcelain on a large scale, for general purposes; but when it is applied to more costly and artistic works very special arrangements are required; and in the case of remarkably fine pieces, instead of the huge kilns, which hold frequently many thousands of pieces, small furnaces (fig. 14) are used for each separate article for the biscuit, the glaze, and the enamelled gilding. These, in porcelain, are applied on the glaze, and not on the biscuit.

In the decoration of painted pottery and porcelain the colours employed are coloured glasses ground to impalpable powders, and mixed with borax or some other fluxing material, on which they are generally made liquid with oil of spike, and they are laid on with hair-pencils, in the same way as oil-colours. The whole process is exactly the same as in painting or staining glass; the glaze on the biscuit-porcelain being true glass, and the enamel colours being exactly the same as those used by the glass decorator. The colours may be made by mixing the materials of which glass is made with the colouring materials in enamelled colours on transfer paper, and the article is then dipped into the already coloured glass and the flux. When the former plan is employed the principal colouring materials made use of are oxide of chromium for green; oxide of iron for red, brown, violet, gray, and yellow; oxide of uranium for orange, yellow, and black; oxide of vanadium for green and purple; oxide of cobalt for blue, gray, and black; oxide of antimony for yellow; oxide of titanium for yellow; oxide of copper for green; suboxide of copper for red; sesquioxide of iridium for fine black; protochrome of iron for brown; chromate of lead for yellow; chromate of barytes for yellow; chloride of silver for deepening reds and purples; purple of Cassius for ruby and purple. Several of these colours are much increased in brilliancy by the addition of oxide of zinc, which of itself gives no colour; and the transparent ones are rendered opaque by the addition of oxide of tin.

Other fluxes besides borax are used—as sand, felspar, boracic acid, minute or litharge, salt, salt-petre, potash, and soda. For the gliding of pottery gold-leaf is rubbed down with oil of turpentine; or metallic gold or powdered bismuth is added to the melt from its solution. The finely-divided gold so obtained is washed and dried, and then worked up with one-sixteenth of its weight of oxide of bismuth and oil of turpentine, painted on, fired, and afterwards burnished.

History.—The most ancient pottery of which we have any trace consists of the rude clay urns, vases, and other vessels found in the tombs of the prehistoric races. These remains exhibit the art of the potter in its most elementary condition, yet they are not devoid of elegance of form, and the decorative instinct of primitive man found appropriate expression on them in bands of incised lines forming lozenge, zigzags, and other geometrical forms, and in impressed wavy cord marks, &c. See LAKE-DWELLINGS, STONE AGE, TROY.

Egypt.—If we except the races of the far East, it is to the Egyptians among historical nations to whom precedence must be assigned in the art of the potter. We know that at a very remote period people made bricks of sun-dried clay cementsed with straw, which were sufficient for the purposes of construction in a country where there is scarcely any rainfall. Vases of baked earthenware were also in use at the earliest period of Egyptian civilization, and glazed tiles are preserved which belong to the epoch of Ramesses III., not long after the exodus of the Israelites from Egypt. That the Egyptians attained considerable skill as potters is attested by the lustrous red ware they made for holding perfumes, wine, honey, and other delicacies; but their most remarkable pottery was their so-called porcelain made of a fine sand or frit covered with a thick silicious glaze, blue, green, white, purple, or yellow in colour. The blue colour—which is that principally employed—was produced by an oxide of copper which yielded tints of unrivalled beauty and fineness. This was fashioned into vases, sepulchral figures of deities, scarabeae, beasts, &c.; and it must have obtained such estimation that it was found in most of the ancient countries which had commerce with Egypt. The unglaIZED Egyptian pottery (fig. 15) illustrates the fact, also attested by
early Greek vases, that the vase as well as the
statuary figure had its origin in the human form.
On these early vases the head, body, and limbs are
figured, and the body of the vase is only an exaggerated
human trunk.
Assyrian.—In the contemporary
empires of Assyria and Babylon
pottery was also in use at an early
period. Sun-dried and kiln-dried
bricks were made about 2000 B.C.,
and like Egyptian bricks these were
stamped with the names and titles
of the reigning monarchs, and the
locality for which they were destined.
Glazed bricks of various colours,
occasionally enlivened with figures of
men and animals, were introduced
into constructions, and Semiramis is
said to have adorned them with the walls of
Babylon. In these bricks we have the earliest
example of the employment of materials for colouring
like those now in use. The glaze, however, is
silicious. Glazed polychromatic bricks were also
used in the construction of the walls of the palace of
King Darius, the contemporary of the prophet
Daniel, at Susa (scriptural Shushan). These
bricks varied so as to be set together into
regular geometrical patterns, colossal figures of
men, &c. in high relief. The objects most remark-
able for size are the large coffins found at Warka,
supposed by some to be the ' Ur of the Chaldees.'
The Assyrians and Babylonians used terra-cotta for
historical and legal purposes, making cylinders,
hexagonal prisms, tiles and tablets of it, on which
were impressed extensive writings in the cuneiform
character. Some of the most remarkable of these
tables contain an account of the campaign of
Sennacherib against Judah and the tributes of
Hezekiah; others give a record of the flood, the
creation, &c. See BABYLONIA.
Phoenician.—Contemporaneously the Hebrews and
Phoenicians practised the art, but of purely
Hebrew work few traces remain. Phoe-
nician pottery, however, has been abund-
antly excavated in Cyprus, and may be
taken as a type of the works of both
peoples. It is principally of a cream colour
and of a brick red body, ornamented in
horizontal bands, with lines in amber and
red, concentric circles, and other geometri-
cal forms being the most common deco-
ration. They also moulded rude figures of
deities and of domestic animals, the latter
having apparently been used as toys by
children.
Greek.—The most remarkable pottery
of antiquity was the Greek, which seems in
its earliest development to have had
a certain affinity with Phoenician products.
The Greeks claimed the invention of the
potter's wheel, and the principal cities
contested the honour of the art, which is
mentioned in Homer and attributed to
Correhus of Athens, Hyperbius of Corinth,
or Talos the nephew of Dedalus.
The Greek vases which remain to this day, prin-
cipally recovered from tombs in Greece and in the
lands to which its commerce reached, show
that within a few centuries the art rose from
the rude condition like that shown in prehistoric
pottery till it reached a perfection and variety of
form and a grace and dignity of decoration not
since attained by the efforts of any people. It was
the triumph of pure art, for the material of which
the body of Greek vases is fabricated is of the
commonest type, and the colours the artists had
at their disposal were few and simple. The archaic
pottery of the Greeks down to about the 7th
century B.C. was like the rude earthenware of
prehistoric times. Their first improvement consisted
in the application of a brown glaze to the surface
of the ware, which enabled them to give to vases
the incised ornament, scratched through the glaze
into the differently coloured body. Next the
potters discovered black pigment which they could
apply over the brown glaze, and thus increase
their decorative resources by painting geometrical
patterns in black. By degrees the purely geometri-
cal forms of ornament were abandoned, and figures
of animals, rising ultimately to the human figure,
were painted in black silhouette on the vases,
some of the details being touched with white and
purple. In the case of the human figure faces and
limbs began to be expressed in white and colour on
the black figures painted on a red ground.
Consequently, the rough clay body of the vases began
to be wholly or partially covered with an engobe or
slip of clay of much finer quality and colour, the
engobe being applied by dipping the moulded
article into a vessel containing the slip. With
these developments in material and decorative
variety the forms of the vases and the skill of the
artist draughtsman show steady and continuas
development. Just as the best period in Greek
art approached the favourite method of vase
decoration underwent a total change. The decora-
tive figures, deities and men, were traced on their
red and white clay surfaces; but, instead of the
figures being filled up in black, the surrounding
space—the body of the vase itself—was blackened,
giving a black varnished background with figures
the colour of the underlying body. The details of
these figures are indicated with fine lines. Some-
times the faces and limbs are filled up in white, and
the draperies may be parti-coloured. At this stage
Greek pottery reached its greatest loveliness of
form and perfection of ornamentation, the drawing
being supremely refined, delicate, and spirited.
Among the most interesting of the Greek vases
which remain to us are certain of the Panathenic
amphora—prizes won at the public games in
Athens—on one side of which was painted an
archaic figure of Athens, and on the other any
appropriate design with the inscription:
ΤΑΞΙΑΝΟΕΝΟΡΟΑΘΗΝ." In most cases also they
contain the name of the archeon or chief-magis-
trate of the city for the year, in this way enabling
us to find the precise date of the manufacture. Of
these vases ten are in the British Museum, six of
which bear the name of the archeon, and the Louvre
possesses three, which, from the archon's names
they bear, can be referred to 323, 321, 313 B.C.
respectively. At this period the decadence of Greek art had already set in. The drawing degenerated speedily, figures were multiplied and crowded in confusion; ornament became coarsely superabundant, and the proportions of the vases became exaggerated and bad. Subjects themselves were no longer lofty and heroic, but connected with incidents of everyday life, with burlesque scenes, and with fancy.

In the history of Greek art no subject has excited more widespread interest within recent years than the terra-cotta figurines or statuette figures and groups found principally in tombs and about temples of the later period. From 1875 downwards a great number of such figures were excavated from tombs at Tanagra in Boeotia; subsequently a very important find was made at Myrina on the coast of Asia Minor, opposite the island of Mitylene, and at Tarentum, Corinth, the Crimea, Cyprus, the Cyrenaics on the African coast, and in other localities quantities of such figurines have been obtained. The Tanagra figurines were found in tombs which contained no painted vases; but some glass vessels, lamps, and inferior black pottery were associated with them, indicating that the statuettes belonged probably to the Christian era. The terra-cotta ware of the Ancient and Asian coast comes down to a period as late as the time of Septimius Severus. The objects from the Tanagra tombs consist principally of single figures and groups of draped females and young girls; subjects, drawn from the everyday life of the people, treated with true Artistic grace and simplicity, and with marvellous sculptural feeling. In the Myrina series, which obviously have a different inspiration, deities and heroes of mythology form the most important element—Apollo and Bacchus, Silenus, satyrs, and maenads frequently recurring. The figures are mostly polychromatic, sober, earthy colours, not fired in, having been used to tint them; but in some the colours are true enamel pigments. Miniature reproductions of known statuary figures and groups also occur among these exquisite works in terra-cotta.

Etruscan.—From the fact that much Greek pottery has been found in Etruscan tombs, this ware came to be popularly known as Etruscan pottery. True Etruscan pottery, however, was rarely painted. The most characteristic ware of that people, with a bright colour throughout, but covered with a lustrous siliceous glaze. The red colour nearly resembles in appearance and texture a coarse sealing-potter; the surface was often remarkably fine. The vases, generally of small dimensions, were turned on the lathe; the ornaments were moulded separately, and attached to the vase; patterns were produced by the repetition of the same mould, or by placing the bas-reliefs from various moulds on the vases. This kind of pottery was first made by the Romans at Arezzo, but subsequently, or nearly simultaneously, was produced at Capua and Cumae in the 1st century. It afterwards extended over all the Roman world, and was made in Gaul and Germany. While under the republic it was at first extremely fine, the manufacture deteriorated under the last of the twelve Caesars, and the ware is no longer found under the Antonines. The names of several hundred potters are found stamped upon existing specimens of this ware, some of them evidently of Gaulish origin. It was extensively imported into Britain and other remote provinces of the empire. In Britain the Roman conquerors established the manufacture of pottery in many localities, making use of the native clays. The ware was generally of inferior quality, but some objects were made of good red and white ware, and there are examples which are very rare in Britain, and it is said that some of them are of Oriental origin. It is said that in the time of the Severi, the underglaze colour was as bright as upon the surface, but afterwards it became dark, and the ware was not made at Rome in the 2nd century.

Roman.—The only important development made in pottery under Roman rule was this Aretine or Samian ware. It is evidently imitated in its decoration from works in metal, in all probability from the chased cups of silver and gold which began to come into use in Italy, and was a continuation of the later moulded wares of Greece and Italy. The Samian ware of the Romans, so called from having originated in the island of Samos, was of a bright red colour throughout, but covered with a lustrous siliceous glaze. The red colour nearly resembles in appearance and texture a coarse sealing-potter; the surface was often remarkably fine. The vases, generally of small dimension, were turned on the lathe; the ornaments were moulded separately, and attached to the vase; patterns were produced by the repetition of the same mould, or by placing the bas-reliefs from various moulds on the vases. It can be no doubt that the production of brilliant enameled pottery simultaneously in the East and the West—in Persia, Damascus, and Rhodes on the one side, and in the Spanish peninsula on the other, exeroused a powerful influence on the origin and progress of the same art in Italy. But there, under the contemporaneous renaissance of art generally, the decoration of the pottery assumed a distinctively European character, and it attained a much greater freedom, wealth, and variety of decorative resource than was reached by any of its predecessors. The use of the fine white enamel glaze yielded by tin in Italy first associated with the name of Luca della Robbia. The great sculptor, who employed it in coating his terra-cotta relief figures and groups, works which are now among the most prized treasures of art. From his time onwards the application of this tin enamel to earthenware became common in Italy, and it is to such pottery that the name Majolica properly belongs. One of the most famous of the many artists who produced this ware was Giorgio Andreaoli, commonly known as Maestro Giorgio, who worked at Gubbio during the first half of the 16th century. His pieces, Gubbio ware, are distinguished by a remarkable iridescence, flashing ruby, golden, and opaline tints of marvellous brilliancy with every variation of light. Among the most famous centres of Majolica production in Italy besides Gubbio were Pesaro, Urbino, Castel Durante, Diruta, Faenza, Forli, and Venice. The artistic value of the products declined with the waning of art in Italy in the 17th century.

France.—From Italy the art of making enameled ware passed with Catharine de' Medici into France, and the manufacture was established on Italian models in Nevers about 1590, and there it flourished till the end of the 17th century. But previous to that time the celebrated Bernard Palissy in 1555, after unhearkened exertions, had independently discovered an enamel glaze, which he applied to his characteristic rustic dishes, embellished with exquisitely moulded figures, in high relief, of fishes, reptiles, fruits, and other figures. But while Palissy was pursuing his investigations there was being produced in France a limited number of specimens of a ware which has become much more famous than the works of any other pottery, ancient or modern. During the last fifty years only attention has been prominently drawn to a few examples of pottery, very distin-

tive in form, exceedingly rich in decorative treatment, and highly original in the method by which it had been elaborated. At first it was known as Henri Deux ware, from many of the pieces containing the cypher and emblems of Henry II. and of Diana of Poitiers. Subsequently, owing to the acceptance of a false theory of its origin, it was designated Orin ware; but, after much investigation and many suggestions, it has been discovered that the pieces were made at St. Porchaire (Deux-Sèvres) between 1555 and 1566. Henri Deux ware consists entirely of decorative pieces treated in an architectural manner, the body of the ware being a creamy pipeclay, with inlaid ornamentation in colour, and beautifully modelled masks, trusses, &c., and a transparent glaze. Only sixty-five pieces are known, and when any now change hands it is at an enormous price. In the Hamilton

The celebrated enamelled ware of Holland owes its origin to the attempts of the Dutch to imitate the oriental porcelain with which they were made familiar by their eastern trade and connections. The manufacture dates only from the 17th century, and from the fact that it was principally centred at Delft fine pottery came to be known generally in Britain as Delft.
ware or 'Delft.' To imitate the fine lustreous white of the ordinary porcelain body time-honoured glaze was employed by the Dutch potters, and their coloured decorations were in blue, and at first entirely oriental in character. Stoneware Bellarmines or Greybeards (q.v.), and the tall beer-jugs of the Germans, usually decorated with moulded ornaments, medallions and inscriptions &c, were stoneware, the spoken of as Grès de Flandres, are really almost exclusively of German origin, and may be traced, according to their colour and quality, to the neighbourhood of Cologne, Coblenz, and to Kressen in Bavaria, &c. Stoneware vessels of the same nature were also made in England early in the 18th century.

England.—Till the close of the 17th century the ware made in England was of a coarse, common description, and those who could afford the luxury obtained their pottery from the Dutch and other superior makers. The first step towards improvement was effected by John Dwight, M.A., who in 1671 obtained a patent for making stoneware, vulgarly called Cologne ware, and by him the Fulham manufacture of stoneware was first established. A still more marked influence was produced on English pottery about the same time by the brothers Elers, from Nuremberg, who settled at Barlston, and there produced a ware which they called red Staffordshire ware. To these potters we owe also the origin of the process of salt-glazing of stoneware. Finding their secrets were discovered by Astbury, they removed to Lambeth, where they established themselves in 1710. From this time onwards improvements were introduced in the Staffordshire potteries; but the great strides which for a time put English pottery in the foremost rank of the productions of the world were due to the great potter Josiah Wedgwood (1730-95, q.v.). In every department, in body or paste, in methods of ornamentation, and in the employment of artists of the highest ability, Wedgwood, with untiring application and with unstinted expenditure, aimed after perfection; and his efforts alone raised the manufacture of pottery in England to the position of an industry of national importance. Away from Staffordshire potteries of some importance existed at Lambeth, Bristol, Liverpool, Leeds, Lowestoft, and Swansea; but by degrees the manufacture drew more and more towards Staffordshire, where, in the towns collectively known as 'The Potteries,' embracing Stoke-on-Trent, Etruria, Hanley, Burslem, and some others, it now principally centres. Josiah Spode (1754-1827) made a famous kind of opaque porcelain or 'ironstone china.' English stoneware and pottery owe much to Sir Henry Doulton (q.v.), and his works at Lambeth, in the Potteries, and near Glasgow.

Peruvian.—In the New World the art of the potter showed an interesting development among the ancient Mexicans and Peruvians before the American continent became known to Europeans. No knowledge of glazes than those of the people, but, in the case of the Peruvians especially, a high degree of skill in working clay was developed; and they modelled and modified animal forms with great knowledge and spirit. Their most characteristic pottery was black, but they also made vessels of a fine, warm, yellowish body, formed on the potter's wheel, and having painted decorations analogous in style to those on archaic Greek vases.

Porcelain.—The substances with which we have dealt in this brief historical summary up to this point comprise only pottery, as contradistinguished from porcelain. The term porcelain is of Italian origin, derived from porcellana, the cowrie shell, owing to the similarity of the white glazed surface of the porcelain to that of the shell. Of porcelain there are two varieties, one being soft or artificial porcelain, the pâte tendre of the French, which may be looked on as a chemical compound, and which is wholly fusible at high temperature. The second variety, hard or kaolinic porcelain (the French pâte dure), is the true oriental porcelain, composed of two natural mineral substances alone, Kaolin (q.v.), an infusible white clay, and petuntse, a mixture of felspar and quartz, fusible in its nature, the presence of which gives its semi-fused translucency to the body of the vase.

China.—It is to the Chinese that the world owes the manufacture of porcelain; and in strict chronological sequence, in antiquity of the industry, in skill and resource in working raw materials, and in richness and variety of the finished products the Chinese porcelain ranks first place. When the Greeks were making their terra-cotta vases the Chinese were manufacturing porcelain; they had mastered the secrets of that most difficult of all ceramic tasks 2000 years before it was accomplished by Europeans. According to their own records, pottery was made in the Chinese empire in the reign of their mythical Emperor Hwang-ti about 2690 B.C. Without assuming the historical accuracy of such a precise date, there is no doubt that true porcelain was made in China under the Han dynasty between 206 B.C. and 220 A.D. From that time onward the art developed and improved, and, subject to fluctuations caused by revolutionary troubles, the porcelain manufacture continued to flourish in China till recent times. The most famous centre of the industry was formerly King-te-chin, the present Peking; but the production of Kiung-si, where it is known porcelain was made about 680 A.D. In this town alone there were early in the 18th century no fewer than 3000 porcelain furnaces; but the place was ruined by the Tai-jing insurrection. Chinese porcelain exhibits endless variety in form and painted decoration. The mythical dragon, the kylin or mythical lion, the spotted deer, domestic fowls and other birds are favourite subjects on Chinese ware. Of all Chinese porcelain that now most sought after is the old brown ware with its at first copied and imitated by the Delft manufacturers. Crackle ware, in which the glaze shows a series of separation towards the body, is a peculiarity of oriental manufacture. The Chinese appear to possess the secret of causing the cracks in the glaze to be large or minute at will. Ruby glazed ware (the Sang de boef of the French) and the bejewelled glazed porcelain are also highly treasured in Chinese porcelain. The soft sea-green glazed ware known as Celadon glaze

![Fig. 23.—Chinese Porcelain Vase.](image)
POTTERY

is assumed to be the earliest form of Chinese porcelain, and genuine ancient pieces are highly valued.

Japan.—A knowledge of Chinese porcelain passed into Japan as early as it is said, as 27 B.C.; and it is known that a corporation of porcelain-makers was established in that country in 720 A.D. In the 18th century a Japanese potter went to China to improve himself in the art of porcelain-making, and after his return he carried on the manufacture in his native country with great success. It is, however, more in the manufacture of pottery than of porcelain that the Japanese exhibit pre-eminent skill. The most famous porcelain manufacture consists of Satsuma ware, having been established in the neighbourhood of Kyōto by the formerly powerful princes of Satsuma. It is of a pale yellowish colour, covered with minute crackles in the glaze, and very richly painted and lavishly gilt. The so-called Satsuma now manufactured is yellower in colour than genuine old pieces, and it is principally made at Atawa near Kyōto. The Japanese potters generally display a remarkable power in moulding pottery and finishing its surface so as to imitate other substances, such as woods of various kinds, basket-work, &c. Among their most remarkable productions are examples of delicate moulding in Banko ware, which consists of small teapots and other vessels of a brownish and greyish unglazed earthenware, extremely light and thin in body, and very much appreciated among the native population for tea-making. The Japanese excel in the manufacture of egg-shell porcelain, so called on account of the extreme thinness of the body. Among their other porcelain manufactures Kaga ware is the most outstanding, being characterised by painted ornaments in a rich ruby colour, which is generally lawfully gilt. It is a favourite with the Japanese, and frequent flower in their vases, the crane and other birds figure most effectively, and figures of warriors and ladies are frequently employed in the resourceful and varied ornamentation of Japanese ware. The principal centres of the pottery industry in Japan are in the province of Owari, whence comes Seto ware; Kaga, for ware of that name; and Mino and Kyōto.

Persia.—Chinese porcelain was known in Persia as early as the 12th century, a circumstance not to be wondered at, seeing that Persia is then supposed to have been for centuries before the principal highway of commerce between the far East and Europe. Many evidences exist of the acquaintance of the Persians with the ceramic products of China; and at an early date pottery and a species of soft porcelain were made in Persia which both in form and decoration were modelled on Chinese originals. But Persia also had a manufacture of pottery and of enamelled tiles of an original and distinctive character, in which a fine white enamelled glaze brilliantly gilt, which lustres were employed in a most effective and original manner.

Porcelain in Europe.—In the 13th century the early European traveller, Marco Polo, visited the porcelain factories of China. In 1287 Lorenzo de' Medici received from the sultan of Egypt a present of porcelain. In 1312, according to the first record we possess of the appearance of the ware in Europe, the Portuguese were the first to import porcelain direct from the East; and subsequently large quantities were brought by the Dutch and by the East India Companies of other nations. No sooner did the ware become known in Europe than strenuous efforts were put forth in many quarters to imitate it. A certain amount of porcelain is alleged to have been made in Venice about 1470; but the earliest European porcelain of which any examples exist is that which was made by Francis de' Meskeli II., Grand-duke of Tuscany, about 1530. The quantity made appears to have been small, and the attempts at the manufacture ceased with the death of the grand-duke in 1587. Nearly a century later the art was revived at Rouen and at Paris, but it was not till 1693 that a permanent and well-established industry was founded in France at St Clou. Thereafter, porcelain manufacture was taken up in other French towns. At Vincennes it was begun in 1745; in 1753 Louis XV. became a partner in that concern. In 1756 the works were transferred to Sèvres, and in 1760 that establishment became entirely national property; and so it has continued amid all fluctuations in government and the present day. Hard porcelain was first made at Sèvres in 1764; but the fame of that establishment rests on its soft porcelain, in which body, glaze, and enamel colours blend together into a singularly smooth and lustrous whole.

But in Europe it was in Germany that the secret of making hard or kaolinic porcelain was first discovered. After years of labour and innumerable trials, which resulted only in the production of a kind of opaque glass or imitations of porcelain, Böttger (q.v.), an alchemist who had entered the service of Frederick Augustus II. of Saxony, succeeded in 1700 in making a white hard porcelain at Meissen, near Dresden. The china-clay and china-stone he employed had previously been searched for in vain by Schmor at Aue. Extraordinary precautions were taken to prevent the process of the manufacture from being revealed; but, notwithstanding the oaths imposed on the workmen and the other means employed for their supervision, the secret was betrayed by one Spindel, who fled to Vienna, and there the imperial factory which continues to this day was established in 1718. Subsequently factories under national protection were established at Höchst in 1740, at St Petersburg in 1744, at Berlin in 1750, and at Ludwigsburg in 1758. Works at which soft porcelain was principally made were established at Doccin near Florence in 1735, at Capo di Monte near Naples in 1736, and at Buen Retiro in Spain in 1759; and the products of all these manufactories have attained considerable reputation.

In Great Britain manufacturers have at all times devoted themselves principally to the making of a variety of soft porcelain. The works at Chelsea, Bow, and Derby were established about 1745, and in 1751 the manufacture began at Worcester, where it still continues. Hard porcelain-making was begun at Coalport in 1768, following by the celebrated china-clay at Coalport in 1768, after he had discovered china-clay in Cornwall. But his work continued only for about three years. Cookworthy's patent rights were then transferred to Richard Champion, who continued the manufacture at Bristol till 1781. In Staffordshire porcelain was first made at Longport, Hall near Newcastle in 1752, but it was not till about the close of the 18th century that Staffordshire porcelain became artistically and technically fine in the hands of Thomas Minton, who founded the famous works of Minton & Company, and of Josiah Spode, whose undertaking continues under the firm of Copeland & Company.
In the later part of the 18th century valuable porcelain was also made at Lowestoft, Coalport, Nantgarw, Swansea, and some other centres. The manufacture of Parian or stoneware porcelain, which is an unglazed modification of English soft porcelain, was introduced by Copeland and Minton about 1848.

It is a common practice to place on pottery and porcelain distinctive marks, either painted on or stamped into the bottom of the articles. These indicate either the manufactory in which the pieces were made, or the workman, and sometimes the decorator, employed on them; and in the case of Chinese and Japanese ware the marks give the dynasty or date of execution. It is only in the case of Sèvres porcelain that the habit of marking a date by letters of the alphabet was practised. In Chinese porcelain date-marks are found indicating that the piece was made as far back as the 10th century; but there is reason to believe that many of these early marks are forged, and at most are only copies of more ancient examples which have now ceased to exist. On some pieces of early majolica the date, place, and name of the artist are given. The great European manufactories have generally marks which indicate the place of making only; but there are often cases of arriving approximately at the date. The illustrations (fig. 25) show the marks employed at various important English works; but many of the manufacturers imprinted or impressed their names in full. In connection with these marks and names it should be borne in mind that it is easier to forge marks and names than it is to produce works equal to the originals.

imitated, the excellence and value of which causes such forgeries to be put in circulation. There is a vast quantity of forged porcelain in existence, and, specially, imitations of the fine old soft porcelain of Sèvres and of other famous fabrîques are very abundant.

The literature of pottery and porcelain is exceedingly voluminous. Among standard works of general interest may be mentioned Bonganni, Traité des Arts Cérámiques (3d ed. 1877); Marryat, History of Potter and Porcelain (2d ed. 1864); Jaquemart, Histoire de la Céramique (1873; Eng. trans. by Mrs Palliser, Lond. 1873); Garnier, Histoire de la Céramique (Tours, 1883); Davillier, Les Origines de la Porcelaine en Europe (1883); South Kensington Museum Art Handbooks: Birch, Ancient Pottery (new ed. 1879); Bayes and Collignon, Histoire de la Céramique Grecque (1888); Jewit, Ceramic Art of Great Britain (new ed. 1883); Solon, The Art of the Old English Potter (2d ed. 1885); Meteyard, Wedgwood and his Works (1875); Audley and Bowes, Ceramic Art of Japan (1881); Garnier, La Porcelaine Française de Sèvres (1880 et seq.; English trans. nearly simultaneously); Bowes, Japanese Pottery (1890); Darell and Delange, Revue de Peinture Italienne (1867). Fig. 23.—Marks on English Ware:

Pottstown, a borough of Pennsylvania, on the Schuylkill River, at the mouth of Manatawny Creek (both crossed by bridges), 40 miles by rail NW. of Philadelphia. It contains iron-foundries, blast-furnaces, rolling-mills, nail-factories, ear-work, &c. Pop. (1880) 5505; (1900) 13,696.

Pottsville, capital of Schuylkill county, Pennsylvania, is built on the side of steep hills, on the Schuylkill River, at the entrance of Norwegian Creek, 93 miles by rail NW. of Philadelphia. It is in the midst of a rich anthracite coal and iron region, and has several iron-foundries, foundries, rolling-mills, machine-shops, sawmills, &c. Pop. (1880) 12,233; (1900) 15,710.

Potwalloppers (from pot, and wallop, ‘to boil or bubble’), the popular designation of a class
of electors forming the constituency of various English boroughs (e.g. Taunton, Preston) before the Reform Act of 1832. Sir James Stephen's book "Votes as such as seek their own diet in a fireplace of their own." At Taunton in the 18th century several inmates or lodgers would, some little time before the election, bring out their pots, and make fires in the street, and dwell their victuals in the sight of their neighbours, that their votes be not called in question" (Defoe's "Tour through Great Britain", 4th ed. 1748).

**Pouched Mouse** (*Dipodomys*), a genus of small, lean, long-tailed, agile rodents, with cheek-pouches. The best-known species is *D. phillipsi*, from the waste regions of California, where it seems to frequent the Hudson River. It is a species of seeds and roots, and in the dry season no drink but dew.

**Pouched Rat** (*Pseudomys or Geomyys*), a genus of plump, short-tailed, hamster-like rodents, with cheek-pouches which open externally and are used as receptacles for food. One of the best-known species is *P. or *G. burraria*, sometimes called "Ground squirrel." It is a native of North America, and inhabits the territories east of the Rocky Mountains and west of the Mississippi. It is a burrower like the mole, active in the warm weather, hybernating in the cold, sluggish above ground, but very active in its subterranean procreation. It is a plump edifice—edifice, and is 3094 feet in length from anchorage to anchorage; or, including the approaching viaducts, nearly 7100 feet. Over three spans are cantilevers, with arms of 160 feet. The city is well built, with fine public and private edifices, but the spans have not 32 stories from the river. Poughkeepsie is the largest town between New York and Albany; its manufactures include machinery, iron-ware, silk, boots and shoes, clothing, &c., and it has a rolling-mill, a blast-furnace, and several breweries. Two miles to the north is the United States Hospital for the Insane, which cost $750,000, and the city contains a number of charitable institutions. But Poughkeepsie has most reason to be proud of its educational facilities. Vassar College (q.v.) is just beyond the eastern city limit, and the town possesses also a collegiate institute, a business college, and several high-class seminaries and academies, besides the public schools. Poughkeepsie was settled by the Dutch about 1680; in 1778 it was the state capital, and in 1788 the New York Convention met here to ratify the constitution of the United States. Pop. (1870) 89,680; (1900) 24,829.

**Poultice.** See OCTOPUS.

**Poultice**, an application to diseased or painful parts, for the purpose of promoting suppuration, relieving pain, and stimulating or soothing the skin, according to circumstances. A poultice may be composed of any moist, pulpy substance of sufficient consistence to retain the water without dripping, or soaking through the flannel or linen covering in which it is generally applied. The making of a poultice well is a matter of some nicety, and unless the proper consistence is given to the mass the application is apt to do more harm than good. The lined-meal poultice is the most easily made, and most satisfactory of all soothing applications. It is made by heating a sufficient quantity of boiling water, placed in the bottom of a small basin or teacup, until a perfectly smooth pulp is formed of the proper consistence, and in quantity sufficient to cover completely, to the thickness of three-quarters of an inch, the whole part of the body to which it is applied. It is then placed in a flannel, or poured into a flannel bag, and applied as soon as the heat will permit it to be borne. If it is to be applied to a wound, threatening abscesses, &c., where a softening effect on the superficial tissues is desired, some oil should be smeared over the surface, and the poultice put directly in contact with the skin. If applied for pain, or some deeper inflammation where heat is chiefly needed, the oil is unnecessary, and the poultice should be enveloped in cotton-wool or in several layers of flannel. It can then be borne hotter, and will retain its heat longer. The bread and milk, or even bread and water or bran poultice, is also very good; as is also the oatmeal-porridge poultice, to which a little butter may be added with advantage. A spoonful or two of yeast may be added, if there are foul discharges, or, or sprinkled on the surface of the poultice before it is applied, or it may be made with a non-irritating antiseptic lotion instead of plain water (e.g. corrosive sublimate, from 1 to 2000). Carrot poultices are in great favour with the people of the West, and the use of fennel poultices, made of the fresh leaves, or of the dried leaves, with the aid of some powder of the leaves, form a valuable sedative application in painful diseases; and poppy-heads, or even opium, are sometimes infused in the water of which a poultice is made, for the same purpose. A stimulating poultice may be made by sprinkling oil of turpentine, or chloroform, or mustard in moderate quantity on the surface of any ordinary poultice. When considerable irritation of the skin in a short time is desirable, a mustard poultice is used. For the danger of poultice, see EXCRESCE.
Europe, being, it is supposed, brought into Britain by the Romans, since whose time it has been an important article and we have not some forty distinct. The fighting qualities of game fowls have always been specially studied, and Cock-fighting (q.v.) was once a recognized sport in the United Kingdom, followed by all classes of society.

Poultry are valued for two purposes: (1) for their flesh, and (2) for their eggs. The value of the latter has been computed at £2,235,451; that of the former at £4,356,807, in the United Kingdom in 1890.

There are all kinds of British poultry; their caprices have been occasionally described by the most ancient writers, and upon some important occasions they were fed with great expense. The keeper of poultry is a very profitable occupation, and those who possess the knowledge necessary to carry it on are always in demand. The love of poultry is a passion that is growing more general every year, and the trade is becoming more important with every season. The demand for poultry is increasing, and the supply is not keeping pace with it. The cost of breeding and feeding poultry is a matter of great importance, and should be carefully attended to.

General Purpose Poultry. — Breeds which are not specially good in any one quality, but well balanced and good all round; chiefly of the Chinese type—i.e., heavy in leg and bone, large in size, and with high tails. Breeds made for this purpose are the Chinese (black) and Japanese (red), whose flesh is excellent in flavour, and easily digested. It enters very largely into the food-supply of the country in an ever-increasing ratio, and is strongly recommended to invalids or persons of weak digestion. Eggs (q.v.) are consumed to an even greater extent, and more generally than can ever be the case with poultry; for they are within the reach of all persons, and are used for every form of cooking, as also largely for manufacturing purposes. The great and ever-increasing demand in Britain for this class of food is seen in the vast imports, which have grown so enormously. In 1864 the value of eggs imported from the continent of Europe was £355,028; in 1870, £1,102,080; 1875, £2,539,800; 1880, £7,730,500; and 1885, £14,535,807, besides poultry to the value of about half a million. And in the same period it is estimated that the eggs and poultry received into Great Britain from Ireland, which has always been a large poultry and egg-producing country, amounted to one and three-quarter million pounds and more, so that Britain's poultry and egg consumption, if we take the value of home production as equal to that of Ireland, is nearly seven and a half million pounds annually. A calculation was made in 1864 to make an allowance for the quantities that the income derived from the sale of eggs and poultry in that country is £13,496,000—viz., £6,140,000 for poultry, and £7,356,000 for eggs. The number of fowls is computed at 45,000,000, representing a value of £4,500,000. It has been said that the daily consumption of eggs in the United States is 44,000,000, which would represent an annual value of more than £200,000,000.

Although the breeds of poultry are not so numerous as are those of pigeons, the development of breeds since the era of poultry-shows has been very rapid, and we have now a great many new breeds. There are several varieties, several of which are again subdivided by different colours. There are about twenty varieties of ducks, seven of geese, and six of Turkeys (q.v.) domesticated. Ducks are most prolific layers, and there is always a good demand for their eggs, especially by cooks and confectioners. The breeds of ducks valued for table purposes and for breeding are almost all good layers—the Aylesbury, Pekin, and Cayuga breeds being famous; the eggs of the Roman breed are rather smaller than those of Aylesbury. Few may be divided into four classes—viz., table breeds; laying or non-sitting breeds; general purpose breeds; and fancy or ornamental breeds.

Table Poultry. — Characterised by rapid growth, fine quality of flesh, and great breast development. Important British breeds are the Leghorns (blue), the Bantams (six varieties), the Bantams (thirteen varieties, but constantly being added to, many from China and Japan), the Long-tailed, Silkie, Sultans, Frizzled, Naked Neck, and Rumpless, &c.

That poultry can be made profitable is undoubted, but hitherto the great majority of British poultry-farms as such have ended in failure. Considerable profit is often made by those who breed and exhibit pure-bred poultry, whilst the advantage of having fresh eggs and home-fed poultry is sufficient inducement to any who wish to try them. Few, if any, fewfors, apart from the pleasure derived from them. Poultry can be kept under many conditions, and have been found to thrive in the most unlikely places, but all their wants must be artificially supplied. To maintain them in health they should have a house dry above and below, with 16 square feet of floor space for every half-dozen fowls of the medium-sized varieties, an outside shelter in which is placed a dust bath, this being the way in which their skin and feathers are cleansed, and an open run without. If they can be given full liberty it is all the better, but, if not, a good aviary should be placed out in fields or parks are the best; but often it is impossible to do this, and then not less than 6 square feet of ground should be allowed to each fowl if the run is laid in gravel or sand, or 100 square feet per bird if it is made up of grass and hay, the latter are not attainable in the ground by them, some substitute must

Laying or Non-sitting Poultry. — In these the laying powers have been greatly developed (some varieties producing upwards of 200 eggs per annum), and their value is almost the same, but the market is much stricter. They are chiefly of the Mediterranean family, but not exclusively so. These Mediterranean varieties have large single combs, a lightish body, and include Ancooms (speckled), Andalusian (blue), Leghorns or Italans (of which there are ten varieties), the They (black or white), and Black Hamburgs (with long white faces). — Under this term are two families, the Yorkshire and Lancashire Pheasant Fowls (spangled and black), as also the Redcaps, and the Dutch (pencilled), all very beautiful, and the most prolific layers we have. — Apolites.— Austrian French breed, with a crest, pale legs, and five toes. — Have a very large crest, are good layers, but are delicate; of these there are six colours. Scotch Greens.—A cuckoo-plumaged fowl, with pale legs, good flesh, and suitable for cold climates. — Fancy or Ornamental Poultry. — These include the breeds which are either bred alone for their beauty or peculiarity of plumage, or by reason of diminutive size are of no service for economic purposes. They embrace the Game Bantams (six varieties), Bantams (thirteen varieties, but constantly being added to, many from China and Japan), the Long-tailed, Silkie, Sultans, Frizzled, Naked Neck, and Rumpless, &c.
be provided. For laying birds it is found that soft food is very beneficial, and it should be given in the morning, with hard even in the later part of the day. Sheep, for example, are kept in the field for the first five months, and are then kept in the shed for the next two months, and after that four times a day until they reach maturity. Artificial incubation and brooding are very largely adopted by poultry-breeders, and have been brought to a remarkable state of perfection, the machines now sold working with great regularity and precision (see INCUBATION). The advantage of incubators is that they can be used at any period of the year, and are not dependent upon the weather, as is the case with hens. The Heron and Westernia incubators are the best, and the Westernia brooder has proved remarkably successful for all kinds of poultry. This plan of working is largely employed in France and America. Poultry are polygamous, and from four to ten hens should be placed with each cock bird, according to breed and the season of the year.

Poultry-farming.—Many attempts have been made to improve poultry-farms, but they have always ended in failure, and it has come to be regarded as an axiom that poultry will not pay. The reasons for this failure have been twofold: first, that the amount of space necessary to keep the fowls in health when in large numbers, and the consequent increase of labor, were too heavy a charge against the enterprise; and second, the placing of a large number of birds together, under conditions which were unhealthy, induced disease, and so ruined the scheme. The great mistake has been made in attempting poultry-farming as a separate industry, rather than as part of a larger enterprise. Where this can be grafted upon other work, an addition to the business of farming or fruit-growing, it can be, and has been, made successful in several notable instances. In these there is no separate charge for land; the labour is not on account of it alone; and the prices of the food being obtained by themselves from the ground, and such as is given is at the first cost; the produce can generally be sold with what other is going to market, and especially if dairying or fruit-growing be introduced into, these when purchase milk or butter or fruit being necessarily sold at a smaller profit, and chickens; and, finally, the land is enriched by the manure of the fowls, whilst its employment for other purposes will prevent its becoming foul, the great danger when only poultry are kept on the land, for disease is speedily induced by foul ground.

The force of events during recent years has compelled many British farmers to take up what were at one time regarded as minor pursuits, and branches of farming which in themselves are not sufficient to give a living—for which reason they were neglected for many years—have received attention. Once it has been expressed, ‘commercial poultry will only pay as an accessory to something else, whether it be a farm or a household—to eat scraps which would otherwise be wasted ... and to give to the land, in the shape of manure, poultry-yard manure, which can be obtained except by a heavy outlay.’ When we look to France, where poultry are bred to such an enormous extent, we find that poultry-farms as such have no existence, but that fowls are kept by every farmer and cottager. The same remarks apply to Italy. In Italy, the number from all of which countries England receives large supplies of eggs and poultry. In the wine districts of France fowls are permitted to wander amongst the vines all the year round, except just when the fruit is forming, and they do a most serviceable work in cleaning and manuring the ground. The French poultry-farmers grow vines, cultivate the land, and keep vines, and in many cases are made sufficiently narrow to pass between the rows of plants.

In France, in the Surrey and Sussex districts of England, and also at Aylesbury, where so many ducks are fattened every year, systems of fattening are extensively carried on, but as a rule, in France, especially, those who rear the birds do not fatten. Fattening is a business by itself, birds being purchased from the breeders when about eight weeks old. They are put into pens and fattened for a period varying from three to ten weeks, either by land or with machines. Some of the machines are very elaborate, but as a rule they are simple. The head of the fowl is held in the left hand, and a brass nozzle, attached to a piece of India-rubber tubing, and connected with a cylinder, is inserted into the mouth of the bird. In this cylinder is a supply of liquid food, made of buckwheat or some other meal, milk, and a little fat, and it is so arranged that when a pedal is pressed by the foot a portion of the food, varying according to the stage of fattening—for it is increased in quantity each day until the process is completed—is injected through the tube and nourishes the bird.

By this means the fattening is carefully and skilfully conducted, and there can be no doubt of the result, as every one who has tasted a well-fattened French fowl will be able to testify. In the La Bresse, Le Mans, and La Sarthe districts of France, the number of fowls fattened every year is enormous, and the best specimens realise very high prices. The flesh is beautifully tender and white, and much more abundant than would be possible on an unfattened fowl. In Surrey and Sussex the method adopted is somewhat different, in that the birds are either fed by land or with heavy crank cramping-machines, powerful enough to force semi-liquid food into the crop of the fowl. Here the process does not last more than three weeks. When the birds are killed they are immediately plucked and placed, before they become too cold, in the ice-boxes used for the transport of butter. This process has been found to give them the best appearance. In Ireland there is very little fattening carried on, and consequently the poultry from that country are poor and sell at about the lowest price on the English market.

When the fowls are kept in large numbers the best method of keeping them is to build them portable houses or portable dwellings, for these can be transferred about from place to place, giving the fowls fresh ground and distributing their manure, which is very valuable indeed, over the land. Under no circumstances should more than fifty be kept on one flock; and it will be found in practice that they will not wander far from their home, or mix with each other, even if the houses be placed in adjoining fields. The ordinary methods of management are applicable here. There can be no question that the increasing price of land, which has taken place within the last half of the 19th century, has done much to discourage poultry-keeping, and the opposite tendency ought to have a reactive effect (see PEASANT PROPRIETORS). Much might be done in the way of encouraging poultry-keeping by adopting the cottage system, which has been found of the highest value, both in the minimum of cost and the maximum of results. A very important factor in successful poultry-keeping is the selection of right breeds, and it is essential that the produce should be marketed as specifically as possible. An egg two days old is worth twice as much as the same egg three days old, and this difference is always to be borne in mind, but is too often forgotten.

In the great cities and densely populated districts there is a constant demand for fresh eggs, and at
high prices. To secure the best returns all eggs and poultry should be sent to market clean, well packed, and in the best possible condition. The supply of the commoner varieties of poultry produced is very large, and the prices obtained are consequently small, but there is no limit to the demand for high-class qualities at remunerative figures.

See L. Wright, The Illustrated Book of Poultry (new ed. 1888); Tegetmeier, Poultry Book (new ed. 1872), and Poultry for the Table and Market (1892); Poultry (Dean and Son); S. Besse, Profitable Poultry-keeping (1883); L. C. Bale, Poultry-keeping for Farmers and Cottage-keepers, by the present writer (1893); also the articles Duck, Goose, Guinea Fowl, Turkey, Egg, Food, Incubation, &c.

Pounce, powdered resin, or some gum-resin such as mastic, sandarach, or copal, and also the powder of cattle-fish bones, formerly used for sprinkling over freshly-written writing to prevent blotting; fine sand was often substituted for pounce.

Pound (Sax. pund, Ger. pfund, Lat. pondus, 'weight'), long the unit of weight in the western and central states of Europe, differing, however, in value in all of them. The symbol lb. for it is equally general, originally derived from the Latin word libra. The old English pound, which is said to have been the standard of weight from the time of William the Conqueror till that of Henry VII., was derived from the weight of 7080 grains of wheat, all taken from the middle of the ear, and well dried. For a double weight, between the present avoirdupois and troy pound, see AVOIRDUPOIS, WEIGHTS AND MEASURES. In the British Pharmacopoeia of 1864 the troy ounce was given up, and the pound avoirdupois and the ounce avoirdupois were adopted. See also livre, mark.

The pound weight of silver, a common money standard among the ancient Romans, was introduced by them into the countries they conquered, and thus the term 'pound' became a designation of a certain amount of coined money. Thus, nowadays, the English pound is considered as something (a coin or otherwise) equivalent to 20 shillings, but originally it denoted the pound of silver which was coined into 20 shillings. From Edward I.'s time the coins were more and more diminished in size, that monarch coined 25 shillings from his, which only weighed as much as half of bullion his various successors coined 30, 45, 48, 96, 144, 288, in the time of Elizabeth 60, and under George I. 66 shillings to the pound of silver, and this rate still continues, the term 'pound' being severed from its original meaning, and signifying 20 shillings of the present coinage. The sovereign of gold was first struck under Henry VII.; its value rose to as much as 30 shillings; under Charles II. it was fixed at 21 shillings, and the sovereign was superseded by the Guinea (q.v.) till 1817 (see Money, Mint). The pound weight, originally of the same value as the English one, sank in value after 1355 till in 1600 it was but one-twelfth of the value of the English pound, and was accordingly worth 1s. 8d.; it was divided into twenty shillings, each worth an English penny. The Treaty of Utrecht fixed the money thereupon used should be of the same standard and fineness throughout the United Kingdom.

Pound, in English law, means an enclosure, of which there was generally one in every parish or manor, in which stray cattle were put and detained until the damage done by them was paid for. Whenever a stranger's cattle trespass on another's lands the latter can seize them, and take them to the pound, or impound them, as it is called, damage feasant, and can keep them there till the expenses are repaid. There was a distinction between pound overt, or common pound, and pound covert, or close pound; in the former case the owner of the beasts could go and feed and water his cattle while impounded, and it was his duty to do so; but not in the latter case. Now it is compulsory for the impounder in all cases to supply the cattle with water and feed, and to keep the animal in the pounds, he incurs a penalty; and if impounded cattle are not sufficiently fed a stranger who feeds them may not only trespass on lands to do so, but can recover the costs from the owner of the beasts. Goods dismembered, if liable to the stolen damage, should be returned to the pound covert. At Madresfield, near Malvern, a public pound was repaired so recently as 1888; but practically they are quite obsolete, since the law now permits a person dismembering for rent to secure the distress on the premises (see Distress). In the United States estrays are generally liable to be sold for the benefit of the poor of the place where they are found, or for some other public use.

Poundal, a name sometimes used for the absolute foot pound second unit of force, which will produce in one pound a velocity of one foot per second, after acting for one second.

Pounds, John. See Ragged Schools.

Poussin. See Pushkin.

Poussin, Nicolas, a painter of great celebrity, was born at Les Andelys in Normandy in June 1594, went at the age of eighteen to Paris, and studied with Perdrix, Bourdon, and other artists; he died at Passy, near Paris, and is buried there. His uncle, M. de la Caze, was himself a notary, and others, but chiefly improved himself by drawing from casts, and drawings and prints after Raphael and Giulio Romano, in the collection of M. Courtous, who accorded him access to them. After a long and hard struggle he obtained the object of his desire—the means of visiting Rome. He was thirty years of age when he arrived there, and a considerable period elapsed after that before he obtained much employment. At length, however, he received several important commissions from the Cardinal Barberini, which he executed so successfully that he afterwards rapidly acquired fame and fortune. After an absence of sixteen years he returned to Paris with M. de Chanteloup, and was introduced by Cardinal Richelieu to Louis XIII., who appointed him his painter in ordinary, with apartments in the Louvre, and a liberal salary. But in 1643, annoyed by intrigues against him, he returned to Rome; and there, after producing a large quantity of admirable work, he died on 19th November 1665. His style is a combination of classical ideals and Renaissance tendencies; his colours have changed so as to interfere with the harmony of his pictures, whose noble designs may be admirably studied in the numerous engravings of them. The finest collection of his works is in the Louvre; but some of the best are in the National Gallery, at Dublin, and in English private collections. His nephew, Gaspar Dughet (1613-1675), assumed his uncle's name, and as Gaspar Poussin became famous as a landscapist, his renderings of the Roman Campagna being especially noted. He worked also in tempera and fresco. The National Gallery possesses his MS. drawing with a sacrifice to Abraham.

See works on Nicolas Poussin by St Germain, Boucheté (1858), and Peillon (24 ed. 1875), with an article by Lady Dilke (E. F. S. Pattison) in L'Art (1882).

Pont. See Bin. The name Horned Pont and Bullpont are given in America to the siluroid Amiurus, also called Catfish (q.v.).

Poverty Bay. See Gisborne.

Pownal, another name for the Gwyniad (q.v.). See Coregonus.
POWELL

POYNTER

POWELL, Haden, physicist and theologian, was born in London in 1796, was educated at Oriel College, Oxford, in 1821 became vicar of Plainstead, and in 1824 was made F.R.S. From 1827 till 1829 he wrote a great many scientific papers, and in 1829 he was appointed professor of Geometry at Oxford. He published a history of natural philosophy (1834), treatises on the calculus (1830), optics (1833), and the undulatory theory of light (1841); but he is best known by his contribution on the evidences of Christianity without Judaism (1857), Natural and Divine Truth (1857), and The Order of Nature (1860).

POWELL, John Wesley, an American geologist and anthropologist, was born at Mount Morris, New York, 34th March 1834, and served through the civil war, in which he lost his right arm and rose to the rank of major. He was afterwards professor of Geology in the Wesleyan and Normal universities; in 1868 he spent three months of hardship and peril in exploring the canyons of the Colorado; and in 1870 a survey of that river and its tributaries was placed by congress under his direction. While so engaged he devoted special attention to ethnological researches, and in 1879 he was made director of the new Bureau of Ethnology; in 1881 he was appointed also director of the United States Geological Survey. Major Powell in 1886 received the degree of Ph.D. from Heidelberg and that of LL.D. from Harvard, and in 1887 was president of the American Association for the Advancement of Science; in 1889, as vice-president, he delivered an address on 'Mythological Philosophy.' Besides the Exploration of the Colorado River in 1869-72 (1875), Lands of the Arid Region of the United States (1879), &c., his works include Contributions to North American Ethnology, and Outline of the Philosophy of the North American Indians (Reports of the Bur. of Ethn.).

POWELL, Mary. See Milton.

Power is a legal term, to some extent identical in meaning with such terms as liberty, faculty, &c. A public officer is empowered to do certain acts which are not permitted to private persons. An individual, not under disability, has power to bind himself and to dispose of his property; if he chooses to settle his property he may effect the purposes of the settlement by conferring powers on himself and others; he may, for example, reserve to himself a power of revocation; he may give power to a person who takes a life interest to charge the inheritance with provisions for daughters, &c. Powers of appointment are commonly used in English settlements to enable parents to appoint or dispose settled property among their children. Such powers must be exercised in good faith, and within the limits prescribed of the settler who confers them. A power of attorney is a deed whereby one person appoints another to do some act on his behalf or to represent him generally. A, for example, may make it his attorney, to manage his estate and receive the rents during A's absence abroad. Forms of such powers are given in Davidson, Prideaux, and other books of precedents; the difficult legal questions which arise in regard to powers over settled property are discussed in the treatises of Sugden and Farwell.

Power. For the Mechanical Powers, see Mechanics; and for various motive powers, see Agricultural Implements, Steam-Engines, Silk-Making, Despatch, Fuel; see also Horse-power, Transmission of Power. For the 'Great Powers' of the world, see Balance of Power.

POWERS, Hiram, American sculptor, was born a farmer's son at Woodstock, Vermont, July 29, 1805. While still a boy he went to Cincinnati, Ohio, where he became an apprentice to a clockmaker, and in 1824 he went to Oxford, where he formed the acquaintance of a German sculptor, who taught him to model in clay. Subsequently he was employed for seven years making wax figures and fitting them with machinery for the Cincinnati museum. In 1835 he went to Washington, where he executed the busts of several distinguished persons. Two years later he was enabled to proceed to Italy to study his art, and he resided in Florence till his death on 27th June 1873. There he produced his statue of 'Eve,' which excited the admiration of Thorwaldsen, and in 1843 the still more popular 'Greek Slave,' of which six copies in marble, with casts copies innumerable, were produced. Of his 'Fisher Boy' (1846) three copies were ordered. Among his other works the chief were 'Proserpine,' 'Il Penseroso,' 'California,' 'America,' and 'Vestas.' In 1857, while on his way to New Orleans, he went to the city of Calhoun for South Carolina, and Daniel Webster for Boston, as well as those of J. Q. Adams, Andrew Jackson, Marshall, Van Buren, and other distinguished Americans.

POWHILL. See Pochantos.

POWIS Castle. See Welshpool.

POYNTER, Sir Edward John, painter, was born in Paris, 29th March 1836, the son of Ambrose Poynter, architect, and great-grandson of Thomas Banks, sculptor, R.A. He was educated at Westminster, Brighton College, and Ipswich grammar-school. Very delicate health caused him to be sent to Madeira for the winter of 1832-33, and from this visit arose the earnest desire to become an artist. In the summer of 1833 he went to Rome, and here he made the acquaintance of Frederick Leighton, then a young man painting his picture of 'Cimabue,' who allowed Poynter to work in his studio, drawing from the models and drapery from which he was studying for his picture. In 1836 he went to Paris, and spent some months in London. He now made many designs for stained glass, and drawings on wood for Once a Week and other periodicals, and for Dalziel's projected Illustrated Bible. This led him to study Egyptian art; and in 1844 he began his large 'Israel in Egypt,' of which the whole is a reconstructed picture. His water-colours in 1851 were much admired, and he was elected to the Royal Water Colour Society in 1853. In 1858 he was made an A.R.A., in 1876 an R.A. In 1871 he was appointed Slade professor, and in 1876 Director for Art and Principal of the training-schools at South Kensington—appointments which in 1883 he resigned as interfering too seriously with his time for painting. Among the most important of his works are 'The Catafalque' (1885); 'The Prodigal Son' (1869); 'The Blue Girl' (1871); 'The Festival' and 'The Golden Age' (1875); 'Zenobia' (1876); 'A Visit to Assuan' (1880, now at South Kensington); 'The Ida of March' (1883); 'Outward Bound' (1886); 'A Corner of the Market Place' (1887); 'Under the Sea Wall' (1888); 'A Corner in the Villa' (1889); 'The Visit of the Queen of Sheba to Solomon' (1890); and 'Persians and Amazons' (1872), 'The Dreamer' (1875), Wantley and Rame (1876), 'Northcote' (1876), 'Nausicaa and her Maidens' (1879), all painted for the Earl of Warrickhilfe, and now at Wortley Hall. In the years 1869-70 he did the cartoons for a large mosaic of St George in the central lobby of the Houses of Parliament. In 1882-84 he painted designs for the decoration of the dome of St Paul's, and cartoons (full size) for one portion of the dome. Of portraits may be
PRAED

POZZO DI BORGO

mentioned those of Lord Ripon (1886), Sir Gerald Graham (1886), and the Earl of Harewood (1888). In 1894 he became director of the National Gallery. In 1896 he joined Biddulph Grammar School, and knighthood. See the article by Cosmo Monkhouse in the Art Journal for Easter 1897.

Pozzo di Borgo, CARLO ANDREA, COUNT, was born near Ajaccio in Corsica, 8th March 1764, and was educated at the university of Pisa. An advocate in Ajaccio, in 1790 he joined Paoli (q.v.), becoming thenceforth the enemy instead of the friend of Napoleon. In 1796 the allies had driven Napoleon across the Rhine, Pozzo di Borgo drew up the famous declaration, 'that the allies made war not on France, but on Napoleon.' It was he who urged the allies to make war on Bonaparte. He represented Ajaccio at Paris and the Congress of Vienna, at the Congress of Verona, and in London, but retired from public life in 1839, and settled in Paris, where he died, 15th February 1842. See Notice Biographique by Valler (Paris 1842).

Pozzoluillo, a city of Southern Italy, on the Bay of Naples, 7 miles W. of Naples, with which it is connected by a tranversal city particularly interesting from its numerous memorials of classic ages. Its cathedral was the Temple of Augustus. The Temple of Serapis or Serapeum had a rectangular colonnade of twenty-four pillars, surrounding a round temple with sixteen pillars. Some have alleged that the outer enclosure surrounded a market-place. Some of the pillars still standing are much eaten into by the lithodoma mollusc (see Boring Animals), showing that this volcanic coast was for a considerable time submerged to a depth of 10 fathoms. The site was entirely upheaved again. Part of the ruins are still under the sea-level. There are the remains of an amphitheatre in which Nero fought as a gladiator, and which could seat 50,000 spectators; in it wild beasts refused to injure St. Januarus and his companions, thrown to them by persecutors. There are also remains of temples to Diana and Neptune, and of the ancient harbour of Puteoli. Behind the town is the Solfatara (anciently called Forum Vulcain, as being the entrance to Vulcan's forge), a half-extinct volcano, from which issue currents of hot sulphurous gases, injured by sufferers with chest complaints, and springs of saline water, used as a remedy for cutaneous diseases. In the neighbourhood are Avernns (q.v.); the royal (Italian) hunting-lodge Astoni; Lake Lucernina, celebrated for its oysters; the ruins of Baie (q.v.) and Cumae (q.v.); and the Lake of Aghano, with the Grotta del Cane (q.v.). Of a very different interest are the military engineering works, the Stabilimento Armstrong, a little to the west of Pozzoluillo; this is a branch of the famous company of Sir Robert Campbell Elswick, near Newcastle, established here (1888-90) with the support of the Italian government. Pop. 11,967. The ancient Puteoli was made a Roman colony in 194 B.C. Towards the end of the republican period it became virtually the port of Rome, and during the empire was the first emporium of commerce in Italy.

Puteoli was destroyed by Alaric, Genseric, and Totila, and, though rebuilt by the Byzantine Greeks, it was sacked by the Saracens (10th century) and the Turks (1550), and was only finally recovered by the French (1806 and 1838). St Paul landed there.—For the volcanic earth found here and elsewhere, and called Puzzolana or Puzzulana, see CEMENTS.

Practice, in Arithmetic, is the name given to a method, or rather a system of expedients, for shortening or avoiding the operation of compound multiplication. The nature of the expedients will be best understood by a few examples. Suppose the price of 64,875 articles at £2 17s. 6d. is required. It is obvious that the price, at £1, would be £64,875; therefore, at £2, it is £129,750; at 10s. it is the half of that at £1, viz. £32,437.10s. at 5s., the half of this last sum, or £16,218 15s.; and at 2s. 6d., the half of this, or £8109 7s. 6d. The sum of these partial prices gives the whole price.

Praed, WINTHROP MACKWORTH (1802-39), was born 28th July 1802, at 33 John Street, Bedford Row, London. His name Winthrop came from American connections; Mackworth had been the surname of his father, who was a sergeant-at-law. After some time at a public school, he passed to Trinity College, Cambridge, distinguishing himself in mathematics and natural science, and cultivating the lighter letters with increased success in Charles Knight's Quarterly Magazine, where he had for co-editors De Quincey, Macaulay, Moultrie, H. N. Coleridge, and others. In 1825, having won many college honours, he became tutor, and soon if not then, of Aylsham, intending to qualify for the bar, to which four years later he was called. In November 1830 he entered parliament for St Germans. He subsequently became member for Great Yarmouth, and later for Aylesbury, which he represented at his death on 15th July 1839. From 1834 to 1835 he was secretary to the Board of Control.

But for his short life Praed might possibly have been successful as an orator and politician. As it is, he derives his existing reputation from the finished and delightful works which he composed from his childhood. He is the Corypheus of the little band of rhymers whom criticism, according to its taste and fancy, either dignifies or stigmatises as writers of vers de société—a term in its stricter sense applied to those pieces which treat only of the sayings and doings of the fashionable world. The majority of Praed's efforts belong exclusively to this class; and in this line his note is so individual, his rhythm so brilliant, and his wit so bright, that it has hitherto been found more easy to imitate than to excel him. A typical example of this side of his talent is the poem called A Letter of Advice. But he is also admirable in a kind of metrical genre-painting—e.g. The Vicar, which, in the opinion of many, reaches a higher poetical elevation; while in The Red Fisherman, Sir Nicholas, and one or two other pieces, he not unskilfully emulates the manner of Macaulay and Iddo. His characteristics as a verse-writer are point, elegance, and vivacity; it is his defect that these excellent gifts are but seldom relieved by any graver note. His collected verses, popular in America long before they appeared in England, appeared in 1864 in two volumes, with a memoir by the Rev. Derwent Coleridge; in 1887 followed his prose essays; and in 1888 his nephew, Sir George Young, edited his political poems. The best modern study of Praed is to be found in Salimbard's Essays in English Literature (1890).
Prefect, a common name applicable to various Roman functionaries. The most important was the Prefectus urbi, or warden of the city, whose office existed at an early period of Roman history, but was revived under Augustus, with new and extended authority, including the whole powers necessary for the maintenance of peace and order in the city, and an extensive jurisdiction civil and criminal. The Prefectus praetorio was the commander of the troops that guarded the emperor's person.

Prebendaries. See BEDEAS.

Prebendaries. See VERNATION.

Praemunire, the name given, in English law, to a species of offence of the nature of a contempt against the sovereign and his government, and punishable with forfeiture and imprisonment. The name is derived from the first words (premuniire or premoniere facia) of a writ originally introduced for the purpose of repelling papal encroachments on the power of the crown. The action was in the nature of a private suit, by bestowing bishcipses, abbeys, &c. on favourites, often aliens, and the pope's insisting on deciding in his curia cases that ought to have been tried in the king's courts, were especially unpopular in England, and were the immediate causes of various statutes of praemunire. Severe penalties were imposed on those who gave or sought to enforce obedience to the papal encroachments. The Statute of Provisions (1350; see ENGLAND, CHURCH OF, Vol. IV., p. 357) was an early act of this sort; the first act called Praemunire was passed in 1353, but the name of Praemunire is specially used of an act of 1393, in which Richard II. re-enacted and strengthened the statute of Edward III. Under Elizabeth it was made a breach of the Statute of Praemunire to refuse the oath of supremacy. By later statutes of Praemunire, the words in the above description were rendered liable to the penalties of a praemunire, as (by 6 Anne, chap. 7) the asserting that any person, other than according to the Acts of Settlement and Union, has any right to the throne of these kingdoms. The knowing knowledge as well as the omission of any one present at any marriage forbidden by the Royal Marriage Act is declared by 12 Geo. III. chap. 11 to infer a praemunire.

Prænestæ. See PALESTINA.

Prætor was, among the ancient Romans, the title given to the consuls as leaders of the armies of the state; but it was specially employed to designate a magistrate whose powers were scarcely inferior to those of a consul. The praetor, in this specific sense of the term, was first instituted in 366 B.C., as a compensation to the patricians for being obliged to share with the plebeians the honours of consulship. It was virtually a third consulship; the praetor was entitled collegia consularia; he was elected by the same aspersors and at the same comitia. For nearly thirty years patricians alone were eligible for the office; but in 337 B.C. the plebeians made good their right to it also. The praetor's functions were chiefly judicial. Though he sometimes commanded armies, and, in the time of the consulship, had military authority within the city, yet his principal business was the administration of justice both in civil and criminal; and to the edicts of successive praetors the Roman law owes much of its growth. Originally there was only one praetor; but as the city and state increased, and their relations with other nations became more complicated, others were added. In 246 B.C. a second praetor was appointed, to settle disputes that might arise between Romans and foreigners temporarily resident at Rome, for trading or other purposes, hence called praetor perientes ("praetor of the city") and sometimes called praetor urbs ("city praetor"). In 227 two new praetors were appointed, to administer affairs in Sicily and Sardinia; and in 197, two more for the Spanish provinces, or six in all. Sulla increased the number to eight, and Julius Caesar to sixteen. Praetors reduced the number to twelve; but at a later period we read of eighteen, if not more. The city praetorship was reckoned the highest; and after a person had filled this office he sometimes received the administration of a province with the title of propraetor or proconsul.

Praetorian Guard (Lat. Praetorii Cohortes and Praetorian), a body of soldiers organised for the purpose of protecting the person and maintaining the power of the emperors. We read of a praetoria cohors, or select guard of the most valiant soldiers, attached to the person of Scipio Africanus, but it is to Augustus that the institution of them as a separate force was owing. He formed nine or ten cohorts of three thousand men each (horse and foot), but kept only three of them in Rome, the rest being dispersed in cities not far off. Tiberius, however, assembled the nine cohorts at the capital in a permanent camp, and Vitellius increased their number to sixteen. The Praetorians served at first for twelve, and afterwards for five or ten years; they received double pay; the privates were held equal in rank to the centurions in the regular army, and on their retirement each received 20,000 sesterces. They soon acquired a dangerous power, which they exercised in the most unscrupulous manner, deposing and elevating emperors at their pleasure. Aspirants for the imperial dignity found it advisable, and even necessary, to bribe them largely; while those who acquired that dignity without their assistance were accustomed on their accession to purchase their favour by liberal donations. The Praetorians, however, had no political or ambitious views; they were simply an insolent and rapacious soldiery, fond of substantial gratifications, and careless how they got them. After the death of Pertinax (193 A.D.) they actually sold the "purple" for a sum of money to Julianus, who, in the same year, a new and peculiar organisation was entirely broken up by Severus, who formed new cohorts altogether out of the best legions serving on the frontiers, which he increased to four times the number of the old. After several other changes Constantine (312) dispersed them among his regular legions.

Pragmatic Sanction (sometimes Pragmatic Rescript), a solemn ordinance or decree of the head of a kingdom relating either to church or state affairs. The term originated in the Byzantine empire, and signified a public and solemn decree by a prince (pragmaticos, 'business-like,' later 'versed in affairs, 'officer'), as distinguished from the simple rescript, which was a declaration of law in answer to a question propounded by an individual. This name is given to several important treaties, of which the principal are (1) that of St Louis in 1209 and (2) that of Charles VI. in 1439, in which the 
Church (n.v.) were asserted; (3) the instrument which settled the empire of Germany in the House of Austria (1439); (4) the ordinance by which Charles VI., emperor of Germany, having no male issue, settled his dominions on his daughter, the Archduchess Maria Theresa of Austria (1745). The 
first instrument was the accession of the succession of the kingdom of Naples, which was ceded by Charles III. of Spain, in 1700, to his third son and his descendants.
PRAIRIE DOG (Cynomys ludovicianus) is a small rodent closely allied to the European Marmot (q.v.); these animals have received their vernacular name on account of the barking sound which they utter. They live associated together in colonies consisting of numerous burrows excavated by the animals themselves; their range is entirely restricted to the parks and plains of the Rocky Mountain plateau region in North America, and there appear to be two distinct varieties. They have been popularly supposed to share their habitats and to live in friendly relations, with rattle snakes and owls. As regards the rattlesnake, it is more than probable that its occurrence in the burrows of the rodent is to be explained by a desire to make a meal of its neighbours, while the owl may have a similar purpose in view; it is also possible in both cases that the burrows may be
merely utilised as a temporary hiding-place. The Prairie Marmot is rather larger than a large rat, and is of a brownish-grey colour, the under surface greyish white.

**Prairie Hen.** See GREASE.

**Prákrit** is the collective name of those lan-
guages or dialects which are immediately derived
from, or stand in an immediate relation to, Sans-
krit (q.v.). See also INDIA, Vol. VI, p. 102.

**Prase,** a rareish green variety of Quartz (q.v.).

**Pratique** is, strictly, a limited quarantine. A
ship having been put in quarantine when the
Captain has convinced the authorities of a port
that his ship is free from contagious diseases; and he is the
ereupon permitted to open trade and communication
with the shore.

**Prato** (often called Prato in Toscana), a
walled town of Italy, by rail 16½ miles S.E. of
Pistoia and 11 NW. of Florence. It has a citadel
and a cathedral with frescoes by Filippo Lippi,
though the see has been unified with that of Pistoia
since 1653. There are manufactures of straw-plait,
cloth, and paper and brass works. Pop. 13,510.

**Prawn,** a name applied indiscriminately to
crustaceans belonging to the genera Palæmon,
Palaemonetes. They are nearly allied to shrimps and
lobsters, are mostly but not ex-
cursively marine, and vary in size from a couple of
inches to over a foot in some tropical forms. There
are many species; thus, Palæmon quinquedens is
common in the Firth of Forth, while others abound elsewhere.

Many of them are semi-transparent, and exhibit
very fine colours; they are also very active
creatures, and most interesting inmates of an
aquarium, but are excessively voracious, and apt
to make great havoc among the inhabitants.

They are common on the British coasts, although
not so abundant as shrimps, and are generally
taken in the vicinity of rocks at a little distance
from the shore. They may be caught in putting
nets or in osier baskets, like those used for trap-
ing lobsters. They are esteemed for eating even
more highly than the shrimp. For illustration, see
CRUSTACEA.

**Praxinoscope.** See ZOETROPE.

**Praxítëles,** one of the greatest sculptors of
ancient Greece, of whose life little is known,
except that he was a citizen of Athens, and lived in
the 4th century B.C. His principal works—
neither all of which have perished—are the statues of
Aphrodite (at Corfu, Cnidos, Thespiae, and elsewhere)
of which that of Cnidos was the most famous,
Eros (at Spione), Dionysus (at Elles, Athens,
Megara, and other places), Apollo (the best
representing Apollo as the Python-slayer), and
Hermes carrying Dionysus (found at Olympia in
1877). Feminine beauty and Bacchic pleasures
were his favourite subjects; and in his treatment
of these he displayed unrivalled sweetness, grace,
and naturalness. His gods and goddesses were not
very divine, but they were ideal figures of the
fairest earthly lovelinesses.

**Prayer** is a universally acknowledged part of
the worship due to God; not merely petition,
but according to the New Testament models
and Christian usage, praise, adoration, confession
of sin, and thankful acknowledgment of mercies.
It is an innate and natural expression of dependence,
which seems almost necessarily to flow from a belief in the existence
of a god. Accordingly we find it both where
the object of worship is one Supreme Being and in
systems of polytheism. According to the Christian
system, however, prayer is not the mere sponta-
nous or voluntary approach of man to God in the endeavour
to appease his wrath, to win his favour, or to
obtain from him any blessing; but the right to
approach him in prayer, and the warrant to expect
advantage in doing so, rest on the revelation of his
own will. No is any truth more indisputably
taught in the Bible, or more frequently brought
into view in the Old Testament, than the absolute doctrine of predestination to the
most modified scheme which recognises the Creator
as supreme in the universe? Such questions bring up
the same difficulty which attends all other questions
of the relations between the human will and the
free agent, the freedom of man and the sovereignty
of God. But whatever seeming inconsistencies may
be implied in speculation concerning them, the
necessity of prayer and the power of prayer
are acknowledged equally by men of the most opposite
views; and generally with an acknowledgment of the
insufficiency of the human heart to foresee and
solve some of the problems which are thus presented to it. The extreme predestinarian
includes prayer among the means decreed of God along with the end to which
it contributes. And whilst prayer is regarded by
all Christians as of great value in its reflex influence
on the heart and spirit of the worshiper, the power
over stated as its whole value. It is held by
Christians in general that the only true
way of access to God is through the mediation
of Jesus Christ; and that prayer can be truly
made, in faith and for things agreeable to God's
will, only by the help of the Holy Spirit. The
Protestant churches all hold that prayer is to be
made to God alone; but in the Roman Catholic
Church, and to some extent in the oriental churches,
prayer of a kind is made also to saints, the Virgin
Mary, and angels. But as the worship (devo-
ration) of the saints differs from that (latrie)
offered to God, so the invocation of saints and angels is not for
the purpose of obtaining mercy or grace from
them directly, but in order to seek their prayers or intercession with God on our behalf. For this reason Catholics rely not only on the authority of Scripture, but on the unwritten word of God conveyed by tradition from very early times. The inscriptions in the catacombs prove that the
church of the first centuries invoked the saints; and the famous fathers of the 4th century expressly insist on such invocation. Protestants hold that prayer ought to be conducted in a language known to the
worshipers. The Church of Rome has, on the
contrary, maintained the general use of the Latin
language, even though that language is unknown
to the vast majority of the worshipers.

Forms of prayer for public use grew up in the earliest
times, naturally and inevitably: the Lord's
Prayer being doubtless regarded as a warrant
and model. Apparently the most primitive collection
is that in the eighth book of the pseudo-Clementine
Apostolic Constitutions (c.r.). The prayers in con-
nexion with the celebration of the eucharist in
the Greek and Roman communions are dealt with at
LITURGY. The most important post-Reformation
collection of prayers, that of the Anglican Church,
is dealt with in the next article. But most of the
leading reformers prepared prayer-books, Luther's
date from 1522, Zwingli's (Luther's, Strasburg) and
1541 (from Geneva), John Knox's
for the Church of Scotland (based on that of
Geneva) from 1554. The growth of Puritan feeling
in Britain led the Nonconformists, Presbyterians,
and others to undermine the advantages of set forms
of prayer, and to exalt the value of what is assumed
to be the spontaneous utterance of the heart. And ultimately it became usual to regard liturgical forms as essentially Episcopalian and non-Presbyterian, though the forms of church government are irrelevant to the question as to the best mode of guiding congregations in prayer. Since 1857 a section of the Church of Scotland has made tentative efforts towards securing the use of printed forms of public prayer, without wholly excluding extemporaneous prayer (see Lee, Robert). In 1888 the Assembly sanctioned the use of forms for the use of soldiers, sailors, and others; and the Euchologion, by the Church Service Society, has passed through several editions. In the United States liturgical forms of prayer have been almost wholly disused by all the churches save the Episcopal, Lutheran, German and Dutch Reformed, and Moravian churches. But since the middle of the 19th century there has been a manifest tendency to aim at increased dignity in Presbyterian prayer, and to bridge over the gulf that used to separate Presbyterians from the ancient church in the forms of public prayer in the sacred book of God. Professor Shields of Princeton's Presbyterian Book of Common Prayer is simply the Anglican prayer-book with the alterations proposed by the Presbyterians at the Savoy Conference (q.v.).

PRAYER FOR THE DEAD, in the Roman Catholic, Greek, and other churches, is offered with the intention and expectation of obtaining for the souls of the deceased an alleviation of their supposed sufferings after death on account of venial sins, or of the penalty of mortal sins, remitted but not wholly erased, by the practice of praying for the dead. This practice of praying for the dead is usually associated with the doctrine of Purgatory (q.v.), or with the belief in a progressive intermediate state (see HELL). It being once supposed that relations subsist between the two worlds, that their members may mutually assist each other, it is a necessary consequence of the doctrine of purgatory that the living ought to pray for the relief of their suffering brethren beyond the grave. It seems certain that some such doctrine existed in most of the ancient religions. Its existence among them, in the parable of Lazarus and the rich man in 2 Maccabees, chap. xii., that 'it is a holy and wholesome thought to pray for the dead, that they may be loosed from their sins,' Catholics contend that the doctrine as well as the practice is equally recognisable in the early Christian church. They rely on the parable of Lazarus and the rich man (Luke, xvi. 19-31), as establishing the intercommunication of this earth with the world beyond the grave; and on Matt. xii. 32, as proving the remissibility of sin or of punishment after death; as well as on 1 Cor. xv. 28, as attesting the actual practice among the first Christians of performing or undertaking certain ministrations in behalf of the dead. The Fathers of the 2d, 3d, and still more of the 4th and following centuries frequently allude to such prayers, as Clement of Alexandria, Tertullian, Hippolytus, St John Chrysostom, Cyril of Jerusalem, and St Augustine. The liturgies, too, of all the rites without exception contain prayers for the dead; and the sepulchral inscriptions from the catacombs, which reach in their range from the 1st to the 5th century, contain frequent allusions to them. In the services of the medieval and later church prayers for the dead form a prominent and striking element (see Requiem). The Protestant churches without exception repudiated the practice. In the history of English church prayer, W. 1st, his Church Book, and the Book of Common Prayer some prayers for the deceased were retained; but they were expunged from the Second Book; and no trace is to be found in that sanctioned under Elizabeth. Still it is not expressly prohibited, and it is cherished as a private and pious aspiration by not a few within the modern Church of England, as, in Coleridge's phrase, 'something between prayer and wish—an act of natural piety subdued by the instincts into the form of prayer.' On the doctrine of prayer, see Bickersteth, Treatise on Prayer (1856); Canon Liddon, Some Elements of Religion (1872); Newman Hall, Prayer: its Reasonableness and Effectiveness (1875); Jellett, The Efficacy of Prayer (Donnellan Lecture, 1877); the treatises on apologetics, and manuals of Theology. On prayer for the dead, see Plumptre, The Spirits in Prison (1884); Luckock, After Death (1879), and The Intermediate State (1890). For modern scientific objections, see Bishop of Rochester, Christian Social Laws (1874); Tyndall's British Association lecture (1874); and a series of articles in connection with Tyndall's 'Prayer Test' in Contemp. Rev., vol. xx.-xxi., by Tyndall, Galton, and others, with answers by M'Cosh, the Duke of Argyll, and others. For other questions connected with prayer, see the articles Ave, Paternoster, Kneeling, Rosary, Saints, Faith-Healing.

PRAYER, Book of Common. By this name are known the service-book of the Church of England and the several prayer-books of other Episcopal churches which have either been derived from the Church of England or largely influenced by it, such as the Episcopal Church of the United States of America, the Church of Ireland, and the Provincial Church in Scotland. The full title of the English Prayer Book (viz. The Book of Common Prayer, and Administration of the Sacraments, and other Rites and Ceremonies of the Church, according to the use of the Church of England: together with the Psalter, or Psalms of David, and the Book of Common Prayer [viz. The Book of Common Prayer, and Administration of the Sacraments, and other Rites and Ceremonies of the Church, according to the use of the Church of England];) declares the varied character of its contents, and indicates that the volume includes many services besides those (viz. Morning and Evening Prayer) to which the term 'Common Prayer' is strictly applied in the technical language of liturgiologists. Thus it will be seen that this comprehensive service-book embraces elements corresponding to parts not only of the Breviary (q.v.), but also of the Missal (q.v.), the Pontifical (q.v.), and the Sarum Missal. The Book of Common Prayer was (1) to rid the services of features which were regarded as the outcome of superstitition and ignorance (e.g. the invocation of saints, unhistorical and absurd legends read among the 'lessons'; &c.); (2) to introduce a more continuous and more extensive reading of Holy Scripture in the public services; and (3) to present all the services of the church in a language 'understanded of the people.' The publication in 1890 (from a MS. in the British Museum) of the draft, revised by Cranmer, of a reformed Book of Common Prayer to which the term 'Common Prayer' did not apply, was 1. a revision of the Book of Common Prayer which the minds of most of the influential English reformers had been influenced by the corresponding labours of Cardinal Quignon (see Breviary). The first and second of the objects above referred to were attained at in this project; the third work of the reformers was probably never attempted because the bolder design of giving the people all the services of the church in their native tongue had begun to be contemplated. Parts of the preface of Quignon's breviary were transferred, with some modifications, to the preface of the First Prayer-book, and still appear in the prefatory remarks entitled, in the present prayer-book, 'Concerning the Service of the Church.' The first vernacular service put forth by authority for public use was the Litany (1544), differing
of priests and deacons were reduced to the surplice, and those of the bishop to a rochet, for all ministrations. Among changes thus made, though of little or no doctrinal significance, may be mentioned the addition of the sentences, introductory address, general confession, and absolution to morning and evening prayer, and of the decalogue and responses to the closing form of the service.

On the accession of Queen Elizabeth the personal ecclesiastical sentiments of that masterful monarch made themselves sensibly felt. In the newly-revised prayer-book of 1559 (Elizabeth’s Prayer-book) very few changes were made, but they pointed in one direction. The vestments of the clergy were prescribed exactly as in the prayer-book of 1549 were again enjoined; in the litany the words ‘From the tyranny of the bishop of Rome and all his detestable enormities, good Lord, deliver us’ were omitted; in the communion service the words of Edward’s two books at the delivery of the elements were combined in the form still in use; the declaration concerning kneeling (the so-called ‘Black Rubric’) appended to the communion service of Edward VI.’s Second Prayer-book was omitted.

During Elizabeth’s reign the Puritan and Calvinist party within the church increased in strength, and the hopes of its members were raised high on the accession of James I., educated as he had been in Scotland under Presbyterian influence. Not many days after the king’s accession he was presented by the Puritans with a petition, called, from the great number of signatures attached to it, the Millenary Petition. This craved for the removal of ‘offences’ from the prayer-book. The petitioners further suggested a conference, and to this suggestion the king acceded, the outcome being the Hampton Court Conference (January 14, 16, and 18, 1604), so called from its place of meeting. The issue of this conference was deeply disappointing to the Puritan party. The alterations made were comparatively few and unimportant: certain chapters of the Apocrypha (Tobit, v. vii, and viii, and Dan. xiv) were removed from the lectionary; the words ‘or remission of sins’ were added as explanatory of the word, ‘absolution’ at morning prayer; a prayer for the queen and royal family, together with some special thanksgivings, as ‘for rain’, ‘for fair weather’, &c., were inserted. The only changes of much importance were the suppression of the catechism of the part treating of the sacraments (attributed to the pen of Overall, Dean of St Paul’s, and certainly not favourable to the views of the Puritans); and (2) the insistence on baptism being administered by the ‘lawful minister,’ as the church’s order; while the validity of baptism administered by any person using water and the prescribed form of words is still implied in the text of the service. It is worth observing that, while to the three earlier revisions and the last revision (1662) were given parliamentary authority (1552 and 1559, 16 Edw. VI., c. 1; 1 Eliz. chap. 2; 14 Carol. II. chap. 4), James considered that the authority of the crown was sufficient to introduce changes, which he was careful to style ‘explanations,’ as though they were not additions. The Hampton Court Conference’s ‘Prayer-book of the Church of Scotland’ (1637), commonly known as ‘Land’s Prayer-book,’ was a revision of the English prayer-book, in the construction of which Welderburn, Bishop of Dunblane, and Maxwell, Bishop of Ross, were chiefly concerned, their English advisers being Land and other Anglicans. It is remarkable for its reverting in the communion service to some of the characteristic features of the First Prayer-book of Edward VI.—e.g. (1) the ‘ Invocation,’ and (2) the commemoration of the faithful departed. It is also interesting to notice that the Scottish revision anticipated and happily met
some of the difficulties that have since been raised in respect to the Athanasian Creed. The prose
patter of this prayer-book was taken from the
authorised version of the Bible. The word 'presby-
ter' was used instead of 'priest.' The calendar
records the names of certain Scottish saints—e.g.
Columba, Ninian, Serf, Queen Margaret, etc.

The attempt to force this prayer-book upon the
Scottish Church proved a failure. The Episcopal
clergy, as it was, by the riot at St Giles' Cathedral, Edin-
burgh, on the occasion of its first being read (23d
July 1637), and the national uprising that followed
are parts of civil history. It should be added that
the Scottish prayer-book, which had seemed to be
stranged at its birth, was twenty-four years after-
wards among the most potent influences affecting
the revision which has brought the English prayer-
book to its present shape.

During the years of the Great Rebellion it was
enacted by an ordinance of parliament (January
3, 1645) that the 'Westminster Directory for the
Public Worship of God' should take the place of
the prayer-book; and a subsequent ordinance of
the same year (August 23) made the use of the
prayer-book in public 'or in any private place or
family' punishable with the loss of part of the
offence, £10 for the second, and a year's impris-
onment for the third. This harsh measure went a
long way to provoke the reaction of the Act of
Uniformity (1662).

On the restoration of the monarchy, in the vain
hope of conciliating the remaining party of Royalists,
a royal commission was issued (March 25, 1661) to
twelve bishops and twelve Presbyterian divines
(with nine coadjutors on each side) to fill the places
of members of the commission who might be absent
'to advise upon and review the Book of Common
Prayer, the Psalter, and other ancient liturgies which
have been used in the church in the primitive and present times... and, if occasion be,
to make such reasonable and necessary altera-
tions, corrections, and amendments as shall be
agreed upon for the giving satisfaction to tender
consciences.'

The meetings of the commission were held in the
Savoy Palace in the Strand, London, and hence the
name the 'Savoy Conference,' by which they are
commonly designated. Among the best known of
the members were bishops, archbishops, and divines
Cosin, Sanderson, and Brian Walton, with Drs
Pearson, Gunning, and Heylin. Among the Presby-
terians the most eminent were Baxter, Calamy,
Bates, Manton, and Reynolds. One of the most
notable episodes in the history of the conference
was the presentation by Baxter of a liturgy, com-
posed by himself in the space of a few days, which
the Presbyterian commissioners desired should be
authorised and placed on a footing of equality with
the Book of Common Prayer. The conference, as
was to be expected from the temper of the times,
caused in the discomfiture of the Parliam party
very few of whose suggestions were adopted.

Subsequently royal letters were addressed to Con-
voction directing the revision of the Book of
Common Prayer. This revision brought the book to
its present state, with the exception of changes in
the lectionary, which will be noticed below. The result
of the revision was authorised by the Convocations
of Canterbury and York, and its use enjoined
(16th May 1662) by parliament (Act of Uniformity,
14 Carol. II, chap. 4).

A number of noteworthy changes made at the
last revision may be mentioned a new preface
(by Bishop Sanderson); the adoption of the Author-
ised Version for the Epistles and Gospels, the
introduction of the prayer for parliament, of the
prayer 'for all conditions of men,' of the general
thanksgiving, and some of the special thanks-
givings; and the reintroduction in a modified form
of the commemoration of the departed in the com-
memoration service. Of course, a large part of
the prayer-book was preserved intact, very many
minute changes were made, more particularly in
the rubrics. Speaking generally, the changes,
when they possess any distinctive doctrinal colour-
ing, were marked by the dominant influence of the
Scottish Church party. The last form of the prayer-
book is not peculiar to the English Church, but
enjoys a place of authority in the Episcopal Church
of Scotland, a form of the service which is

The English prayer-book is formally declared to be the
'duly authorised service-book of this church for all
the purposes to which it is applicable' (Canon xxxiii.),
but a service for the Holy Communion (brought to
the form in current use in 1794) is sanctioned in
some congregations under certain restrictions.
PRAYER

all consecrations, ordinations, and synods the form in the English prayer-book is required to be used. The Scottish Communion Office is based on the corresponding service in Land's prayer-book, but many important changes have been made. Among the most noteworthy are (1) the transcription of the form of celebration in relation to the prayer for 'the whole state of Christ's Church'; (2) the omission of the words 'militant here in earth'; (3) the alteration in the order of the parts of the prayer of consecration, so that it runs, (a) words of institution, (b) oblation, (c) invocation, in the invocation, of the words, 'that they may become the body and blood,' &c., for 'that they may be unto us the body,' &c. This last change is for its abruptness without parallel or precedent.

For the materials from which the prayer-book has been mainly constructed, consult Maskell's Monumenta Rituale Ecclesiae Anglicanae (3d ed. 1882), and The Ancient Liturgy of the Church of England (3d ed. 1882); Missale ad usum Sarum (Bardinhal ed. 1861-67); Breviarium and Missale (3d ed. 1874-86) by P. Procter; Wordsworth's Breviarium Romanum Quaestionum, edited by J. W. Logie (1888). The successive changes made in the English prayer-book and the Scottish Prayer-book (1662) are exhibited in a convenient form in Keeley's Liturgic Britanniae (2d ed. 1851); they may also be studied in J. Parker's The First Prayer-book of Edward VI, compared with the successive Revisions of the English Prayer-book (1844), and the prayer-book and a commentary on its contents, see Procter's History of the Book of Common Prayer, with a Rationale of its Offices (18th ed. 1880); J. H. Hunt's Annotated History of the Book of Common Prayer (1884); Cardwell's History of Conferences... connected with the Revision of the Book of Common Prayer (2d ed. 1841).

PARKER'S History of the Book of Common Prayer, (1877) is valuable. Cranmer's attempts at a revision of the Breviary is exhibited in Edward VI. and the Book of Common Prayer (1890), by F. A. Gasquet and F. Bishop. Much curious information on the medieval liturgies of England, more particularly that of York, will be found in the Lay Folks' Mass Book, edited for the Early English Text Society by T. E. Simmons (1879). Among commentaries on particular parts of the prayer-book, Scudamore's Notitia Eucharistica (2d ed. 1876) and Bulley's Variations in the Communion and Baptismal Offices (1842) are of much value. The Fasciculus of the Scottish Communion Office, 1563, the Prayers attached to the Act of Uniformity, 1662, were produced in photo-lithograph in 1890. On the history of the Scottish and American Communion Offices, see the writer's A History of the Scottish Communion Office, 2d ed. (1884), and the Historical Sketch, prefixed to Professor S. H. Hart's edition of Seabury's Communion Office (1874).

PRAYER BEADS

a name given to the polished seeds of a West Indian leguminous plant, Abrus precatorius or Wild Liquorice, formerly much used for stringing into rosaries, necklaces, &c.

Praying Wheel, an instrument for offering prayers by mechanical means, used exclusively by the Lamaist Buddhists, on the assumption that the transcendent and infinite, as the result of its repetition. These instruments are of various shapes and sizes, from small cylinders turned by the hand to huge ones driven by water or wind. Long strips of paper with a written or printed formula, which translated reads 'The Jewel in the Lotus', when attached to the cylinder, or when thousands of times, are wrapped round these cylinders, and as the cylinders revolve the paper rolls uncoil, and so the prayer is said.

Preaching, or systematic instruction in religion given by word of mouth, has been almost from the beginning of the Christian church the principal means of disseminating its doctrines, and already its application to the poor is given by our Lord himself as one of the significant signs of the new economy. It is thus distinctively Christian, although it is true that it traces its ancestry to part of the function of the ancient Israelite prophets, who were instructors of the people as to their duties in the present, as well as foretellers of the future. Preaching is, so far as recorded, mostly took the form of the parable, and throughout we find its characteristic marks to be simplicity and variety, some common fact in nature or human experience being taken as the basis of the sermon, and spiritualised in a free and natural manner. Tertullian says, 'Priests, without instituting little, though he inspired much. The discourses given in the Acts also differ widely from modern sermons, their main object being to bring the person and history of Christ plainly before their hearers. The facts of His life, death, and resurrection are everywhere put forward as the roots of Christian faith and practice, and doctrine is ever interpreted without complexity, as practically connected with His person. Justin Martyr (Ap. maj. chap. 67) and Tertullian (Apol. chap. 39) describe the exhortations that followed the reading of Scripture in the Church; but the preacher in the modern sense of the word, although he employed largely the allegorical method of interpreting Scripture, happily now almost extinct. In the early church the bishop was long responsible for the preaching, although presbyters and deacons came to have a share in it. It is difficult to give an historical survey of preaching, its form, its function, and Constantine frequently. Monks were not allowed to preach until the special preaching-orders were organised in the middle ages, nor yet women, although the Montanist heretics permitted them. Sermons were usually delivered on Sundays, as part of the religious rites of the church. The popular instruction was expressed by stamping of feet and clapping of hands, a practice which Chrysostom condemned. After the 9th century preaching appears to have declined, and indeed it never seems to have flourished much. For Tertullian and Origen the ornament of the moral teachings of the preachers was Antony of Padua, Bernard of Clairvaux, Bonaventura, Berthold the Franciscan of Regensburg, John of Monte Corvino, Savonarola, John Tauler of Strasbourg, and Francis Coster (1531-1619). The Reformers were preachers, but the Reformation itself, above all, was new to the world. The new doctrine was in great measure due to the power with which they were given forth from the pulpit. As sacramentarianism lost hold of men's consciences, the higher appeared the value of the new method of learning by what means to draw near to God. Wyclif and his Door Priests, and after him the Lollards, established an evangelical tradition of the supremacy of the pulpit as a means of grace, which we find at its greatest strength in Puritanism. Seventeenth-century preaching was very scriptural, and put prominent in the fore-round the formal evangelical facts of the fall of man, the doom of sin, the redemption of Christ, the sanctifying work of the Holy Spirit. Its strength lay in the reality and vigour with which it realised these truths; its weakness was a tendency to be over-abstract, and to become theological in its religion. The religious culture and barrenness of the 18th century preaching became mainly ethical and apologetical—preaching about Christianity rather than preaching Christ; but, as Dr Johnson says, men at last got tired of hearing the apostles tried once a week for the crime of forgery, and turned for relief to listen to the earnest direct harangues of a Wesley and a Whitefield.
The whole century could show no preachers to be compared with Latimer, Donne, Hall, Andrews, Jeremy Taylor, Howe, Baxter, as well as Fuller, Sanderson, South, Barrow, and Tillotson: still less with their magnificently eloquent French contemporaries Saurin, Bourdaloue, Bossuet, Fénelon, Massillon, La Rnc, and Fléchier. But in the 18th century the voice of the pulpit was heard to speak a stockplatitude of the modern press to the contrary, with such an illustrious roll of preachers as Chalmers, Edward Irving, Robert Hall, F. W. Robertson, Henry Melville, Maurice, Hook, Newmarch, Millet, Pusey, Milman, Parker, Butler, Arnold, Spurgeon, Caird, Guthrie, Beecher, Talmage, Moody, Magee, Liddon, Knox Little, Farrar, Maclaren, Parker, and Phillips Brooks. In France again we find the names of Lacaordaire, Monod, Bersier, and Pressensé; in Germany the Reformation preaching has been choked by Rationalism, but within the century reached its finest flower in Schleiermacher, in whose sympathetic heart there met in strange harmony Pietistic and Rationalist traditions alike. Spener the Pietist, Zollkofer, and Reinhard were earlier German preachers, of whom much may be said.

The modern Church of England has been driven, through the activity of its dissenting rivals, to recognise its neglect of preaching by opening the maces of its cathedrals for special evening services, and now actively employs the pulpit in every parish as a means of spiritual instruction. But whereas he was still recognising it, however, in the words of Dr Hook, as 'a means of instruction, more than a direct means of grace.'

The chief difficulties of the preacher are that he has to speak always to the same hearers—Wesley says he has spoken to himself asleep; his audience is of varying degrees of education and intelligence; his theme is so familiar that it is difficult to compass the grace of novelty—indeed the wonder is rather, as Dr Burnet says, that so many are so good as they are, seeing that the demand in the British Isles alone extends to about 100,000 sermons a week. The foundations of the preacher's success may be said to be his personality, his sincerity, piety, and enthusiasm, his respect and love for his hearers, knowledge of the world in general and of human nature and experience of the world, together with gravity, courage, and intellectual and moral honesty. If to these be added exegetical learning, natural eloquence and fire, with the power of forgetting self in the message to be delivered as an ambassador for Christ, and finally inunction—which, as Vinet says, there is no artificial means of gaining—a preacher of the very highest order is formed. The greatest snare to the young preacher is a not unnatural self-consciousness, and still more the assumption of affectations of voice or action, from which he would quickly shake himself free if he could see how really ridiculous he appears to the pews. The best tonic for his self-consciousness is to be reminded that he himself is but an accident in the vast Christian scheme for the propagation of the gospel, and that the greatest of the apostles was himself content to be nothing so Christ was preached. Happily men without some approximation to a vocation now choose the clerical profession less frequently than formerly, for it is more difficult now to be a Charles Hymonian than it was in our great saint's days. The sovereign law of preaching is to be genuine and natural, for, as Fanst says, 'no heart will take fire if the spark does not come first from the speaker's heart.' In nothing is this ban of unreason to the writer's heart more strongly felt than—of his heart, rather; the high falsetto, the impressive roll, the insinuating whisper, or even whine, are one and all to be abhorred, as suggesting to the ear merely simulated emotions. The best method is to begin from a conversational level, to employ a completely unaffected language and style, and to aim throughout at clearness, all unfair use of the text and unauthorised spiritualising being inadmissible. Plain sensible thoughts in sensible language will still be listened to with attention, if not too long, for the modern hearer endures with difficulty more than thirty to forty minutes, where his fathers expected something at least twice as long. The judicious preacher will seasonally lighten his discourse with illustrations turned to use; but of the graceful, as Fuller says, 'while reasons are the pillars, similes are the windows of every structure.' The same over-witty old divine adds a caution which it can scarcely be said he himself never forgot, 'The preacher avoids such stories whose mention may suggest bad thoughts to the auditors, and will not use a light comparison to make thereof a grave application, for fear his poison go farther than his antidote.' But, while avoiding the grotesque, the preacher must not forget Quintilian's fatal judgment of mediocrity—'his excellence was that he had no mediocrity in his faults,' 'his outstanding excellence.' Jeremy Taylor was a master in the art of illustration, some of his examples being among the most exquisite passages in English prose. The preacher may find his inspiration in the legitimate use of the sermons and other writings of others, no less than in his own experience of life, yet most carefully, still recognising it, however, in the words of Dr Hook, as 'a means of instruction, more than a direct means of grace.'
better ordered discourse and saves the preacher from what to many is a grievous slavery; but Dr James Martineau puts its defence on yet higher grounds as the best means of maintaining the high level of thought and feeling at which the sermon was composed. And it is true that many, perhaps most, extempore preachers forget their arguments and progress, and round off their round, as Coleridge said, in verbiage, vain repetitions, and feeble and garrulous dully. But against this there is the obvious disadvantage in the loss of power and reality that must needs follow the extemporing of pure and emotional thought. The recitation of sermons by heart is scarcely better, if not indeed still more likely to destroy spontaneity and naturalness of expression, not to speak of the risk of some accident depriving the helpless reciter of his memory, as once happened to South, whereupon he left the pulpit abruptly with the words, 'Lord be merciful to our infirmities.' The method of extempore preaching is in every respect the best, provided the speaker's standard of excellence is one sufficiently high, and he is not one of those vain men who make a system of making a sermon into the process of meditation. Provided the sermon has been carefully thought out beforehand, and the preacher has some measure of facility in speech, this method of preaching will be found the most effective, the thoughts being previously methodised, the words and sentences left to the moment. For it is both the most natural manner and it allows speaker and hearers alike to be lifted simultaneously on the same waves of thought and emotion. For, unhappily, there are few men capable of reading a sermon with the same fire and glow as Chalmers. But so long as he keeps himself out of the way of mediocrity and self-possession, 'a great deal of talent is lost to the world for want of a little courage,' says Sydney Smith—and this quality he must possess in a quite unusual degree if he essays the task of preaching to crowds in the open air. The great French preachers, again, recited their sermons, apparently finding it easier than Englishmen do to revive premeditated emotion. Massillon said that his best sermon was the one he knew best; Bondadono, whose memory was apt to give way in presence of any distraction, used to preach with his eyes closed. Leighton begins to preach too soon, and leave off too late;* and still worse for the quality of the sermon is the too frequent necessity for the production of two or more every week. Bishop Andrews said, 'He who preaches twice will prate once; and Robert Hall used to say, 'A man who concentrates his ideas, and thinks out his subject properly, can write one; a diffuse, shallow man may manage two, and a fool might very likely write half a dozen.' Those under the necessity of producing two might well be permitted to make the second a little catechising, as Hume did at Bishopbourne; or an6 easy topics specially directed to children—an admirable new feature of modern preaching; or the second might be frankly allowed to be taken from some great divine, or at least to be merely one of those simpler expositions of religious truth, such as Hooker, who spend their life in their birth, and may have public audience but once.' Over-tasked preachers will find help in those collections of skeleton sermons, of which Simeon's Horse Homiletica (21 vols. 1783-1836) and Spurgeon's Sermon Notes (4 vols. 1884-88) are the best.

As for the form of the sermon, it is usual for it to be divided into an introduction or exordium, the proposition, the proof, and finally the conclusion or peroration. Simeon and his school announced the divisions at the outset; Newman notices them only as he passes from one to the other. As for the logical divisions or heads, in which the Puritan preachers were so prolific—Baxter having as many as 120—the more modern usage is to emasculate these but lightly and to have as few as possible. These are of course all important in the structure of the sermon, for, as Quintilian says, 'Without words, nothing; without order, nothing; even in rerum ordine errare.' George Herbert, in The Country Parson, warns against 'crumbling a text up into small parts; and Bishop Leighton introduced into Scotland the method of preaching without heads—'skimming the text,' as it seemed to the zealous, 'as you would a surface of water, without regard to the shortest, and may take the form of an exegetical connection of text with context—as in Liddon almost always, or an analogy, or an anecdote. The proposition should be clearly set forth, and the proof should follow in logical order, although the heads need not be named. The conclusion, peroration, or application should be an earnest, pointed appeal, warranted by the arguments that have preceded it. 'Hic, si unquam, toto eloquentiae fonte aperiens fas est,' says Quintilian. Indeed, fire and passion we cannot have too much of, if only it is justified in the subject and the connection of the argument, yet allowing the speaker to become the clearer the more he glows. Hume said John Brown of Haddington preached as if Jesus Christ was at his elbow, and James Melville tells us that Knox ere he had done with his sermon 'was like to dig the pulpit in bits, and fly out of it.' Or if a tender closing appeal best fits the subject the speaker must remember that he is a man and not allow himself to be dissolved in tears, unless he needs must, when nature will save him from being ridiculous. Bishop Heber converted the closing peroration into a sermon. In the expository discourse, technically known in Scotland as 'a lecture,' the preacher takes a series of texts or a whole passage, and opens up its meaning, the central truth being clearly set forth, and the minor truths in their relation to it.

Many of the older preachers of the evangelical persuasion never closed a single sermon without a noisy course round the whole range of cardinal doctrines in the scheme of salvation, however wide some of these might lie from the subject proper of the text. This might be well for itinerating preachers like Ainslie or Wesley, who almost certainly never address the same hearers again; but is manifestly absurd in the case of a parish clergyman whose duty is to instruct the saints as well as to raise the unconverted, and who speaks to the same people twice a week. Those preachers whose sermons invariably deal with the initiatory stages of Christian experience sometimes arrogantly claim for themselves a monopoly of preaching Christ.' No phrase has been more abused than this of St Paul's, which has been twisted to mean a mountain view of the necessary conditions of the starting-point only of a Christian experience, as if the pupils of a school were to stand still at their primer because one had not yet learned to spell. But indeed there is too little variety in our teaching,—'We hold a few texts,' say the parsons, 'which hide the rest of the Bible.' Still less profitable were those weekly tirades against the Socinians, the Scarlet Woman, or Prelacy, forced into the conclusion of every sermon by many a painful old Presbyterian divine. Even hell lost its terrors when men no longer showed the personal aspect of the devil, once familiar, became contemptible. But the pains of hell have furnished the fuel for many a noble sermon, even without such a special accessory as Fuller tells us belonged to Mr Perkins, who 'would pronounce the word damn with such an emphasis as left a doleful echo in his
auditors' ears for a good while after.' The autobiographical style is a persistent snare to young converts in their preaching, forgetting how diverse are human character and conditions, how complex is Christian experience, and how large and varied was Christ's own conception of the Kingdom of heaven. The most alarming danger to the pupil in the present day is, however, a manfull hysterical style of treating religions truths, natural enough in a society debauched with the over-excitement and fever of an age of composition, but ultimately fatal to the dignity and authority of a venerable institution, the real foundations of which must be mastery over emotion and firmness of intellectual fibre, as well as comprehensive grasp of the truths revealed by Jesus Christ.

**Precedence,** the order in which individuals are entitled to follow one another in a state procession or on other public occasions. In England the order of precedence depends partly on the statute of 1539, partly on subsequent statutes, royal letters-patent, and ancient usages. Among questions of precedence depending on usage there are some which can hardly be considered as settled by the statute, and are in a great degree left to the discretion of the crown, which generally refers any disputed question to the officers of arms. In Scotland the Lyon Court has the direct jurisdiction in all questions of precedence.

It is a general rule of precedence that persons of the same rank follow according to the order of the creation of that rank; and in the precedence of the English peerage it has been fixed that the younger sons of each preceding rank take place immediately after the eldest son of the next succeeding rank. Married women and widows take the same rank along with each other as their husbands, except such rank be professional or official, and it is an invariable rule that no office gives rank to the wife or children of the holder of it. Unmarried women take the same rank with their eldest brother; the wife of the eldest son, eldest of brothers, however, preceding the sisters of her husband and all other ladies in the same degree with them. Marriage with an inferior does not take away the precedence which a woman enjoys by birth or creation; with this exception, that the wife of a peer always takes her rank on her husband, and her heirs. The following tables exhibit the precedence of different ranks as recognised by law in England.

**Gentlemen.**

389
At the coronation of Charles I, the rule of precedence of the nobility of England was introduced in Scotland; and it was arranged that peers of England (or their sons, &c.), of a given degree, should within England take precedence of peers of the same degree. In that in Scotland this precedence should be reversed. But the acts of Union with Scotland and Ireland the precedence in any given degree of the peerage has been established as follows: (1) Peers of England; (2) Peers of Scotland; (3) Peers of Great Britain; (4) Peers of Ireland; and (5) Peers of the United Kingdom, and Peers of Ireland created subsequently to the Irish Union. A similar order is understood to obtain in regard to baronets, though in Ireland it seems rarely to have become established that all baronets to rank according to the respective dates of their patents.

The following is the table of precedence in Scotland, as recorded in the Lyon Office. It is founded partly on usage and partly on the statutes of 1623 and 1661.

It seems to be held in England that the precedence of Scottish officers of state, judges, &c., as recognised before the Union, does not extend beyond Scotland. There are rules for precedence for the members of the different professions, recognised among themselves, but which give no general social precedence. No rank, for instance, in the army, however high in itself, entitles it to the holder to precedence. Doctors in the universities are ranked thus: (1) Divinity, (2) Law, (3) Medicine. Official rank may often place its possessor, upon occasion of public ceremonies, in a position far above others of higher dignity than himself, but this, of course, confers no rank in the general order of civil precedence; on the other hand, men of official rank, who have higher personal precedence, are placed according to the latter; the wives and children of all who derive their places on the scale from official rank have no consequent privilege. One of the leading principles of the law of precedence is that it enunciates solely from father or husband, and cannot be acquired through a female unless in the case of a peeress in her own right.

Preceptor (sometimes Cantor), the officer who directs the singing in a cathedral or parish church. See Choirs and Choral Singing.

Preceptory, the name given to certain houses of the Knights Templars (q.v.), the superiors of which were called Knights Preceptor. Other houses of the order were called commanderies.

Precession, the name given to a slow motion of the earth, under the action of the sun and moon, which causes the poles of the heavens (which must remain always vertically above the poles of the earth) to describe circles on the sphere of the heavens about the poles of the ecliptic as centres. As the places of stars on celestial charts are marked with reference to the celestial poles, this motion of these poles causes all such charts to become less and less accurate with the lapse of time. A correction for precession has therefore to be applied to such charts in order to find the true places of stars at any epoch other than that for which they are constructed. This motion of the earth also causes the Equinoxes (q.v.) to recede slowly along the ecliptic, so that the sun comes to them, in his annual course, a little earlier each year. Hence the name Precession of the Equinoxes.

The physical cause of this motion is the attraction of the sun and moon for the protuberant part of the earth around the Equator (see Earth). This causes the earth slowly to turn on itself, as a spinning top gy rates when its speed slackens before it falls. As this disturbing force on the earth is small relatively to its mass, this turning takes place at the mean rate of only 501 per annum. It requires, therefore, 25,808 years for the equinoxes to describe a complete circle on the ecliptic. For a very interesting case of the effect of precession, see Pole-Star. In actual observation the effects of precession are complicated with those of Nutation (q.v.) and of change of inclination of the ecliptic. The subject is pretty fully discussed in a popular manner in Herschel's Treatise on Astronomy. For the suggested influence of precession, along with the increased eccentricity of the earth's orbit, or great climatic changes on the earth, see Pleistocene, p. 236.

Precenses. See Rambouillet.

Precious Stones. See Stones (Precious).

Precipitate Ointment is of two kinds, the red and the white. The former contains red oxide of mercury, the latter ammoniated mercury, or white precipitate. In both cases great care is necessary that the mercury preparations are in a very fine state of division, and are intimately mixed with the ointment base. Both ointments are highly stimulating, and are of service in cutaneous eruptions. The red ointment is also employed in chronic conjunctival opthalmia.

Precipitation, in Chemistry, is an operation in which decomposition occurs in a fluid, either through the action of the air, or of a gas, or of a chemical agent, or by solution; it is also produced by the deposition of a solid substance that was either previously held in solution or that has been formed by chemical action.

Precognition. See Criminal Law (Scots).
Predestination, the eternal decree of God whereby 'the elect' are foreordained to salvation. The correlative decree, whereby others are held to be foreordained to perdition, is commonly distinguished by the other term—Reprobation. The theory of predestination had its origin in the attempt of theological system to define the relations of the creatures to the Creator, and to reconcile the phenomena of human freedom with the belief in divine omnipotence. God's absolute will is represented by it as determining the eternal destiny of man, not according to the foreknown character of those whose fate is so determined, but according to God's own mere choice. They who are thus foreordained to eternal life are led to believe and live by the 'irresistible grace' of the Holy Spirit. In human salvation, therefore, God's will is everything, man's nothing. The principal scripture passage is Rom. viii. 29, 30; what was in the discussions between Pelagius and Augustine that the predestinarv view of the divine 'decree' was first fully evolved; and since their time opinion in the church has run in two great currents—the one perpetuating the influence of Pelagius, who regarded man as inborn free, and ordained to a divine foreknowledge of human character; the other that of Augustine, who maintained the absolutism of that decree, and its independence of all prior human conditions. Pelagius recognised a possibility of good in human nature; Augustine denied it. This possibility, apart from the influences of divine grace. The one held that the choice of salvation lay in man's will; the other that man's will had no active freedom or power of choice since the fall. In 529 the system of Augustinianism was approved by the Council of Ephesus, and Athanasius (Orange) as the rule of orthodoxy in the Western Church; but the reaction against the strictly logical nature of his dogma has been perpetually manifested by representatives of the more humane, though perhaps less logical doctrine of Pelagius, in every period. St. Bonaventure, a Grandi monk of the 9th century, carried the doctrine to its most extreme development. The Thomists (see Aquinas), as predestinarians, opposed the Scotch, though Thomists insisted that God willed the salvation of all and has provided the means. This was reformed by Zwingle and permitted. But the Augunarians, though the Lutheran doctrine as formulated by Melanchthon is plainly different from that of Calvin and the Reformed Church. Some Jesuits are Conformists or modified Thomists; others admit that predestination to glory, is irrespective of merit. Jansenism was a revival of Augustinianism. Arminius and the Synod of Dort mark a new period of the controversy. With such opposite representatives as Land and Hales, a large part of the Church of England has held Calvin good-night. The followers of Wesley and Whitfield differed on this great doctrine. Even the Presbyterian churches, or large sections of them, have modified their high predestinarian doctrine in at least the statement of it. The common Augustinian doctrine of faith and election 'of the elect'; moderate Calvinists or 'sub-lapsarians' held that the fall of man (lapsus) was foreseen but not decreed by God (thus trying to avoid ascribing to God the origin of sin); while extreme predestinarians or 'supra-lapsarians' affirm that both were decreed. God decreed the fall of man, overruling it for good. Jonathan Edwards (q.v.) is a modern representative of rigid Calvinism. Catholics hold that the question is one rather of metaphysics than of faith. See the article Will and works there quoted, and the articles on Augustine, Pelagius, Calvin, Jansen, &c.; the theological handbooks of dogmatic history: Freiin Willen (1863); Forbes, Predestination and Freewill (1878); Canon Mozeley, Treatise on the Augustinian Doctrine of Predestination (1878).

Predicables. This is a term in the scholastic logic connected with the scheme of classification. There were three kinds of universals: the first, comprising objects on a systematic plan: genus, species, difference (differentia), property (pronom), and accident (accidentem). The first two—Genus and Species—name the higher and lower classes of the things classified; a Genus comprehends several Species. The other three designations—Difference, Property, Accident—express the attributes that the classification turns upon. The Difference is what distinguishes one species from the other species of the same genus; as, for example, the peculiarities wherein the cat differs from the tiger, lion, and other carnivores. The Property expresses a distinction that is not ultimate, but a consequence of some other peculiarity. Thus, 'the use of tools' is a property of man, and not a difference, for it flows from other assignable attributes of humanity and mental organisation, or from the specific difference that characterises him. The Accident is something not bound up with the nature of the species, but chancing to be present in it. Thus, the high value of gold is an Accident; gold would be gold though it were plenty and cheap. See Categories, Generalisation.

Pre-emption. In the United States, under the Pre-emption Act of 1841, an actual settler on the public lands enjoys the right, in preference to any one else, of purchasing at a fixed price the land on which he has settled, to the extent of not more than 160 acres. In the case of 'offered' lands the settler must file his 'declaratory statement' within thirty days after entry, and within a year proof must be made of settlement and cultivation, and the land thereupon paid for, at $1.25 per acre if outside the limits of a railroad grant, or $2.50 if within such limits. If the tract settled on is 'unpatented,' an approved plan of the township must first be received at the district land office; the statement must then be filed within three months, and final proof and payment must be made within thirty months thereafter. Title to land is thus obtained much sooner (possibly within six months) than under the homestead laws (see Homestead); for a homestead settler may at any time after six months purchase the land under the pre-emption laws; as, on the other hand, the holder of a pre-emption claim may convert it into a homestead.

Pre-established Harmony. See Leibnitiz.

Pre-existence, Doctrine of. The notion that human souls were in existence before the generation of the bodies with which they are united in this world was anciently, and is still, widely spread throughout the East. The Greek philosophers, too, especially those who held the doctrine of transmigration, as the Pythagoreans, Empedocles, and even Plato—if with him transmigration is a system rather than a doctrine—were familiar with the conception. Plato taught that all human souls had existed from the very beginning, still and silent, in the realm of potentiality, and Origen introduced the theory into Christian theology. The dogma of the assumption of the divine and the angelic humanity—was a difficulty in the relations between the two natures in pre-existence. Yet the belief continued to survive, and we find it in Scotus Erigena, in the
Youthful Fichte, in Glanvil and Henry More, and in the profoundest works of modern theology— Müller's" "Deorationis, of Sis—where it forms a basis for the doctrine of hereditary sin. Among the early Christians the assumption of such pre-existence was connected with the belief that God had created the souls of men before the world, and that these were united with human bodies at generation or at birth. Another view long prevalent in the Western Church was that of Traducianism, according to which children received soul as well as body from their parents through natural generation. The third theory, which ultimately became that on which the orthodox was Creationism, according to which each soul is created successively. Direct intellectual interest in the doctrine of pre-existence has nearly altogether ceased in modern times, yet the dream has again and again haunted individual thinkers. Almost every one is familiar in dreams, and even in a waking state, with a haunting sense of a want of reality in the common objects around, and a vague consciousness that everything one sees or hears has happened before, when we, in the words of Tennyson,

To lase far back in a confused dream
To an instinctual simile.

There is a striking expression of this experience in Sir Walter Scott's Diary, under February 17, 1829, and there is an interesting allusion to the same subject in a well-known passage in Guy Mannering.

And Wordsworth has given supreme poetical expression to it in his famous ode—Intimations of Immortality from Recollections of Early Childhood (the germ of which will be found in a less known poem of Vaughan the Silurist):

Our birth is but a sleep and a forgetting;
The soul that rises with us—our life's star
Hath had elsewhere its setting,
And cometh from afar.
Not in entire forgetfulness,
Not in utter nakedness,
But trailing clouds of glory do we come
From God, who is our home.

Prefect (Fr. préfet, from Lat. praefectus; see Prefect), the administrative head of a modern French department (see France, Vol. IV. p. 775), whose action is independent of that of the old Intendant before the Revolution.

Pregnancy. The first symptom which calls attention to the occurrence of pregnancy is usually absence of the menstrual flow. This may, of course, be suppressed by many other causes; and, exceptionally, may persist during the first few months of pregnancy. "Quicking," or the sensations experienced in consequence of the movements of the fetus, is usually noticed in the fourth month. Of the changes which take place elsewhere than in the generative organs the first and most noticeable is sickness, usually occurring in the early morning, and not persisting beyond the first three months. "Longing" for salt, and, sometimes, very curious articles of diet, are not unusual. The heart becomes enlarged in order to provide the increased blood-supply necessary for the nutrition of the fetus. There is often an increased liability to toothache, fainting, and other disturbances of health in either direction are common, nausea is naturally altered, and an unnatural fretfulness or irritability manifests itself. In some cases, on the other hand, the health is exceptionally good. The duration of pregnancy is, in the great majority of cases, about 270 days; but, as variations of a week or ten days in either direction are common, it is not possible to predict the exact date of delivery. Well-authenticated cases have occurred where it has been prolonged to nearly 300 days. It may, of course, come to an end at any time prior to its proper term (see Fetus). There is a curious condition called spontaneous pregnancy, which essentially simulates true pregnancy in all its main features as entirely to deceive the patient as well as others. It is generally associated with Hysteria (q. v.) or some allied mental disturbance (see Mary L., and Southcott). A careful examination enables a medical man to detect the palpitation, but it may be difficult to persuade the patient and her friends of it. As a work of reference for others than specialists, Chavasse's Advice to a Wife on the Management of Her Health (1842; new ed. 1889) may be recommended.

Congenital pregnancy is a criminal offence, or rather it is taken to be the main proof of the offence of concealing the birth of a child in certain circumstances. See Birth.

Prehnite, a hydrous silicate of alumina and lime, the alumina usually partly replaced by ferric oxide. It is a widely diffused mineral, and, although first discovered at the Cape of Good Hope, has been found in great beauty in some places on the continent of Europe, and in Scotland. It occurs in a great variety of forms, being found in crystals in fan-shaped and cockcomb-like groups, granular, reniform, fibrous, &c. It is sometimes colourless, but more generally greenish, and sometimes yellowish. It occurs, as a product of the alteration of various rocks, in veins and in various igneous rocks, such as diorite, porphyrite, &c. Less commonly it is met with under similar conditions in granitoid and schistose rocks, and occasionally in lodes associated with copper.

Prejevalski, Nicholas, Russian traveller, was born in the government of Smolensk on 31st March 1839. He entered the army (1855), and took part in quelling the Polish insurrection of 1861. Having joined the general staff in 1867, he was moved to Siberia. There he began to satisfy his longing for travel by exploring the Usri region, south of the Amur. This, however, was a small thing in comparison with his subsequent labours in geographical exploration. The three years 1871-73 he spent in travelling from Peking through southern Mongolia (region of the Ordus) to the Ala-shan, Koko-nor, and the upper waters of the Yang-tze-Kiang. Four years later he made the first of the journeys undertaken with the hope of reaching Lhasa in Tibet, but he once more crossed the Desert of Gobi, and got as far as the upper Yang-tze-Kiang, but, not being able to cross it or travel down it, was obliged to return. He died at Karakol, on the east side of Lake Issyk-Kul in West Turkestan, just starting on his fifth expedition to Central Asia. His papers and notes brought back from these journeys most valuable collections of animals and plants, now all preserved at St Petersburg: amongst other things that he discovered were the wild camel and the wild horse, the ancestors of the domesticated varieties. His last possible work was published in the Proceedings of the St Petersburg Geographical Society, in Petersmann's Mittheilungen, and other journals, as well as in two independent Russian works (1875 and 1883). See Nature
Prelate (Lat. prelatus, ‘one set over’), in Church law, is the name given to the holders of those higher dignities in the church, to which, of their own right, is attached a proper jurisdiction, not conferred by delegation from any superior official. In this sense the name comprises not only prelates of the first class, as bishops, but also the heads of religious orders, abbots or priors of religious houses, and other similar ecclesiastical dignitaries. In the pope’s court and household many of the officials, although not possessing an ecclesiastical dignitary, have the insignia and title of prelate; and these honours are frequently bestowed on clergy whose duties keep them far from Rome.

Prelude (Lat. pre, ‘before,’ and ludo, ‘I play’), the introductory movement of a musical work (see INTRODUCTION). The first movement of a sonata was usually a prelude; and the term is especially associated with the preludes prefixed by Bach to his celebrated clavichord and organ fugues. It has also been applied, without special significance, by Chopin to his collection of short pieces, op. 28. Its form is indeterminate, but the piece is always in the same key as that succeeding it.

Premonstratensians (called also Norbertines), an order of regular canons, founded by St. Norbert, a canon of Cleves, in 1119, at a place in the forest of Conyé, pointed out in a vision, and thence called Prémontré (Lat. Prætotum Monstratum, ‘the meadow pointed out’). Their habit was white, hence in England they were commonly called the White Canons. Norbert organised his new order, which was substantially a branch of the Canons Regular of St Augustine, as a means of reforming the monastic members as to their usefulness in effecting the reformation of the age. Himself a man of remarkable piety and austerity of life, his rule is a return to the primitive fervour of the monastic institute; and the great work which he proposed for his brethren is captured in the words: ‘in the churches of the world, the service of the people, and the direction of consciences in the confessional. It was taken up with ardour, and spread rapidly in France and the Low Countries, and afterwards—on Norbert’s being chosen, in 1157, Archbishop of Magdeburg—in Germany; the abbot of the mother-house at Conyé, however, retaining the rank of general and of superior of the entire order. In 1512 all the abbeys in England and Wales were placed under the Abbot of Welbeck. There, just before the Reformation, were thirty-five houses; in Scotland there were six, one of them Dryburgh. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain. In the same spirit of reformation Norbert established an order of canons regular, the Premonstratensians, of which he was the first superior. Helyot states that at one time there were as many as a thousand Premonstratensian abbeys, besides provostships and priories, and 500 houses of nuns, mostly in France, Germany, and the northern kingdoms. Lecuy, the last abbot of Prémontré, died at the time of the French revolution, was one of the subscribers at the Revolution, and even in Germany, Belgium, and Austria there remain only miserable fragments of their former splendour. Small communities have been revived at Crowle and Spalding in Lincolnshire and at Storrington in Sussex.

Prentice Pillar. See ROSLIN.

Prenzlau, or Prenzlow, an agricultural town of Prussia, stands at the northern end of Lake Ucker, 67 miles by rail N.E., of Berlin. It has a beautiful Gothic church (1325-40). Pop. (1895) 19,689.

Pre-Raphaelitism. English art of the 18th century had in its genesis one national peculiarity. There being no demand for it from church or state, it had to find a market amongst the younger men, and especially amongst the middle classes, who, in the wants of the people, Hogarth, the first distinctly national subject-painter, found his themes in the social manners of his day, which were valued by the true instinct of the common people. Portrait-painters of national origin had been before his time; but these, good though bad wits, had been followers of foreign masters introduced by the court and supported by its patronage. That art other than architecture was not necessarily an exotic in England is proved convincingly by the many beautiful examples of monumental portraiture produced by native workmen before the Wars of the Roses. The bronze effigies of Henry III. and Queen Eleanor in Westminster Abbey were executed by William Torel, citizen of London, in 1291-92, and those of Richard II. and Queen Anne of Bohemia, in 1395-97, by the brokers of the cooperersmiths and citizens of London, in 1395-97. Austin of London furnishes an excellent and later example of this in his monumental tomb in the Beauchapel Church, Warwick. These works, followed as they were by the Reformation and in quick succession by the parliaments and monopolies, extinguished the native art and necessitated the calling in of foreign aid; for it must be remembered that under the happiest conditions a native artist cannot be produced in less time than a full generation.

Hogarth having once arisen with full daylight of an independent inspiration, it was no longer possible for the mannered reproductions of the imitators of Kneller and Lely to satisfy the spirit of an age now awakened from its long sleep. Hogarth at first gained a footing by portraiture, and when he had earned sufficient for his paintings. In the end, however, he left the service of the church, was the practical instruction of the people, and the direction of consciences in the confessional. It was taken up with ardour, and spread rapidly in France and the Low Countries, and afterwards—on Norbert’s being chosen, in 1157, Archbishop of Magdeburg—in Germany; the abbot of the mother-house at Conyé, however, retaining the rank of general and of superior of the entire order. In 1512 all the abbeys in England and Wales were placed under the Abbot of Welbeck. There, just before the Reformation, were thirty-five houses; in Scotland there were six, one of them Dryburgh. It does not seem at any time to have made much progress, or at least to have established many houses, in Italy or Spain. Prenzlau, or Prenzlow, an agricultural town of Prussia, stands at the northern end of Lake Ucker, 67 miles by rail N.E., of Berlin. It has a beautiful Gothic church (1325-40). Pop. (1895) 19,689.
Opie, Girtin, Blake, Lawrence, Stothard, Constable, Wilkie, Haydon, De Wint, Crome, Turner, Leslie, and not less in the decorative designs of houses by the Adams brothers, in Wedgwood ware, in gold and silver work, and in furniture.

It is rarely that any cause for rejoicing may be found in the world; and certainly at the beginning of the 19th century, but undeniably it did bring great things for the strengthening of English character, and this was the case in no direction more surely than in that of art. When in the peace of 1814 the Continent was thrown open, it is noted by three great painters; Holman Hunt, Millais, and Rossetti. Their English character is supreme in painting among the nations, and this verdict was endorsed by the judgment of many able foreigners. The selection of Sir Thomas Lawrence to paint the members of the Holy Alliance is a convincing proof of this opinion, and the recognition of Constable by France in 1820 is further evidence to the same effect. But alongside of virtuous influences there had been at work a deadly academic dogma which the few far-seeing of that generation recognised as threatening destruction to the still struggling English art, and which had already completely destroyed decorative design. To glance at the members' lists of exhibitions of that day and to recognise how many then held great art are now completely unknown, brings this to the proof. These painters were creatures of orthodox rule, life, and system, seeing whose influence Constable in 1821 prophesied 'in thirty years English art will cease to exist.' Following up this forecast of the great landscape-painter, Leslie thirty years later finds the fulfilment of Constable's prediction in the death of Turner.

It is managed for the young generation to find out what lay at the root of the decay and its remedy. How to get free from the prejudice which blinds the eye to established errors is the preliminary problem to effecting all reformation. The attempt made in Germany in the beginning of the century to cultivate what was called 'Early Christian Art,' was participated in by W. Dyce, D. Maclise, and a few other artists in England. But for youthful seekers after a perfect method these efforts, even where they expressed much of English individuality, were not unboundedly promising, because they failed to put flesh on the theory. One of the earnest young students of the day was William Holman Hunt, who, already feeling his way as a practical painter, was led by circumstances to study in exceptional degree the works of the greatest old masters, and he perceived that in every school progress ended when the pupils derived their manner through dogmas evolved from artists systems rather than from principles of design taught by nature herself. He determined therefore, for his own part, to disregard all the arbitrary rules in vogue in existing schools, and to seek his own road in art by the way of nature. Many masters had founded their sweetness and strength of style. Without any idea of 'forming a school,' but for his own development alone, he began to study with exceptional care and frankness those features of nature which were generally starved over as unworthy attention; and to this purpose he found most timely encouragement in the enthusiastic outburst of Ruskin's appeal to nature in all vital questions of art criticism, as expressed by him in Modern Painters. This period an increasing intimacy was cemented between him and Ford Madox Brown, aged nine, and John Everett Millais, who was already at the age of seventeen the precociously efficient medal student of the Royal Academy and an emulator of the pseudo-classical Ety. This youthful friendship led to frequent consultations over the needs of the growing generation of artists, and Millais declared his confidence in the closer study of nature, which he determined to adopt as soon as work to which he was committed should be completed.

Dante Gabriel Rossetti was at this time also fascinated with the newly-revised principles of art striving after nature, but he had not yet become a practical painter, and there was no certainty that he would do so. He had, before his intimacy with Holman Hunt, begun the study of art under Ford Madox Brown, a painter who had distinguished himself by the most admirable contributions to the Westminster Hall competition, works which Rossetti had the independent good sense to admire. In the year 1848 (when Holman Hunt was engaged on a picture of Rienzi, of which he had already completed the painting of the landscape from nature, and other complicated preparatory work) D. G. Rossetti placed himself with Holman Hunt in his studio in Cleveland Street, where he followed a course of study specially devised for him by the older student to enable him to cope with the difficulties of a picture undertaken in pure experiments. Thus he was finally he is completed; this picture is now well known as The Birthday of the Virgin.

Millais, on his part, forthwith took for his first subject to be treated on the new principles a design from Keats's Isabella. This was originally intended for one of the Royal Academy exhibitions of that year, but was formed into a band called the Pre-Raphaelite Brotherhood, had undertaken to publish. It is the justly famous picture now in the Liverpool Art Gallery.

The three artists, as representing the pre-Raphaelite body, appeared in the exhibition season of 1849, Millais with Lorenzo and Isabella, Holman Hunt with Rienzi, Rossetti with The Girlhood of the Virgin, and excited the most flattering attention; but by the following year a storm of enmity of the most bitter kind was raised against them. Their pictures this second year were Christian Pietsis Escaping from Druid Persecution, by Holman Hunt; Christ in the House of his Parents, by Millais; Rossetti's picture of the Annunciation, he exhibited (as he had done with his picture of the previous year) at another exhibition than the Academy. Many journals were united in condemnation upon the three young artists, but undeniably the most damaging attack was one made by Charles Dickens in Household Words. From this date to his life's end Rossetti discontinued public exhibition. With this attack the bitter feeling against the young men so increased that in the following year (1851) one influential journal advocated that their pictures should be removed from the walls of the Royal Academy a few weeks after the opening of the exhibition. Thus, in the third year of its joint existence, the new school was threatened on all hands. The interest taken in the three artists appeared in the Times three letters from Ruskin denouncing the spirit of jealousy and injustice with which the young men had been assailed. He pointed out the merits of the works and the great influence for good which the revival was likely to exercise upon the English school. Later followed a succession of pictures from the hands of the three young painters, works the titles of which have become familiar throughout England.

Among the works of Holman Hunt are Rienzi (1849), Christian Pietsis Escaping from Druid Persecution (1850), Christian Pietsis and Isabella (1853), and Scapegrace (1856). Among Millais are The Infant Saviour (1850), and Christ in the Temple (1850). The infant Christ is always a subject dear to Millais. Among Rossetti are The Holy Innocents (1883), and Christ the Carpenter (1874). The Triumph of the Innocents (1885). Amongst those of J. E. Millais are Isabella (1849).
PRE-RAPHAELITISM

Although the present article bearing the author's name is "pay to some persons appear egotistical.—W. H. H."

PREROGATIVE

ROYAL. See Divine Right, Parliament, Sovereign, Pardon, Reprieve.

PREROGATIVE COURT. in England, was the court where all wills were proved and administrations taken out. It was so called because it belonged to the prerogative of the archbishop to take charge of these matters, which formerly fell under ecclesiastical supervision. Hence there was a Prerogative Court for the archdiocese of Canterbury and another for the province of York. This jurisdiction was entirely taken away in 1858 from the ecclesiastics, and transferred to a new court called the Probate Court (q.v.).

Presburg (Ger. Pressburg, Hung. Pozsony), a town of Hungary, stands on the left bank of the Danube, 40 miles by rail E. by S. of Vienna and close to the Danube. It is 120th December spurs of the Little Carpathians, and is a pleasant town. Its principal buildings are the cathedral, a Gothic edifice of the 13th century (restored in the middle of the 19th), in which the Kings of Hungary used to be crowned; the church of the Franciscans (1290-97); the houses of the early Romanesque; the history collection; the parliament house, in which the Hungarian representatives used to meet until 1848; and some private houses. The royal castle (1645) was destroyed by fire in 1811, and is now a ruin. There is an academy of jurisprudence and philosophy. The chief objects of manufacture are beer, dynamite, wire, starch, spirits, confectionery, biscuits, &c.; and there is considerable trade in corn, sheep, cattle, swine, and wine.

Presburg grew up to be a prominent town during the 11th and 12th centuries. It was long chosen for conferences and meetings between the rulers of Austria and Hungary. From 1541 (when the Turks seized Buda) down to 1754 it was the capital of Hungary. The town was taken by Bethlen Gabor in 1619, by the Austrians in 1621, and was bombarded by Davout in 1809. In November 1805 Napoleon concluded a treaty with the emperor after the battle of Austerlitz. Pop. (1881) 48,326; (1890) 52,444.

Presbyopia (Gr., 'old sight'), a change in the power of vision, not usually noticed till about forty-five years of age, when near objects come to be less distinctly seen than those at a distance. See Eye, Vol. IV, p. 512.

PRESBYTERIANISM

The name Presbyter is from the Greek presbyteros, 'elder.' The elders formed one division of the great council of the Jews, with the priests and scribes (Mark, xiv. 43); and every synagogue had its body of ruling elders (Luke, vii. 5, viii. 41). From these the name of some portion of the duties were transferred to the Christian church. We have no record of the first appointment of elders, but we find them as recognised rulers in the church of Jerusalem so early as the year 44 (Acts, xi. 30). The duties entrusted to them are these: (1) They had charge of the collections for the poor which were sent by the hands of Barnabas and Saul (Acts, xi. 30). (2) They are specially named as taking part in the council which was held at Jerusalem about the year 51 (Acts, xv. 2), and at the meeting of the church there when Paul reported on the tour with the Gentiles (Acts, xxi. 18). (3) They took part in the ordination of Timothy (1 Tim. iv. 14). (4) They were the pastors and bishops of the congregations. Thus the apostle Paul, addressing the elders of Ephesus, says, 'Take heed . . . to all the flock over which the Holy Ghost hath made you overseers (bishops) to feed the church of God' (Acts, xx. 28). And
writing to Timothy, he says, 'Let the elders that rule well be counted worthy of double honour, especially they which labour in word and doctrine' (1 Tim. v. 17). Elders also are found in all the churches. We have seen them in the mother-church of Jerusalem; and when Paul and Barnabas went forth on their first missionary journey, about the year 46, they ordained elders in every church (Acts, xiv. 22). Accordingly, in the year 75, we find them in the same city a few years later (1 Tim. v. 17, with chap. i. 3), and in Crete. Titus is commanded 'to ordain elders in every city' (Tit. i. 5). These are the scripture facts on which the system of Presbyterianism as a government by elders is based. Not only do we recognize the bishop as the superior of the presbyter, for they were originally two names of the same person. Thus in Titus, i. 5, 7, the apostle writes, 'Ordain elders in every city . . . for a bishop must be blameless,' and in Acts xx. those who in verse 17 are termed elders in verse 28 are termed bishops. On the original identity of the bishop and presbyter Bishop Lightfoot says, 'It is a fact now generally recognised by theologians of all shades of opinion, that in the language of the New Testament the same officer is called bishop, presbyter, elder, presbyter, presbyteros and presbyter.' There are two instances in which the term 'bishop' occurs apart from his being described as 'elder,' just as there are many examples of the elder being mentioned without his being termed bishop (Phil. i. 1; 1 Tim. iii. 2). In the writings of Clement of Rome, about the end of the 1st century, there is the same identity between the elder and the bishop; but from this period onwards the distinction between the two begins to appear, though Jerome in the 4th century writes: 'Among the ancients bishop and presbyter are used synonymously, but of dignity, the other of age.' See the articles BISHOP, CHURCH HISTORY, ORDERS (HOLY).

It is need to be ascertained that Presbyterianism survived in the ancient Celtic Church; but the Celtic polity, though differing widely from diocesan Episcopacy, was very unlike Presbyterianism (see IRELAND, p. 210; SCOTLAND, p. 242; COLUMBIA; CULDEES). The Waldenses (q.v.) were perhaps anti-episcopal. But Presbyterianism as we know it first ascertained itself at or after the Reformation, when earnest attempts were everywhere made to restore to the church the primitive life in Germany, France, and the Continent, from the relationship of church and state, its free development was prevented (see CONSISTORY). It was Calvin (q.v.) in Geneva who, though not its originator, gave Presbyterianism the form which, with modifications, it has ever since retained. It occupies a middle position between diocesan Episcopacy and Congregationalism, and may be styled ecclesiastical republicanism. The congregation elects its own minister and elders, and by deacons or managers regulates all its financial affairs. The session, consisting of the minister and chosen elders, has the oversight of the congregation. The ministers, with one or more elders from each congregation, constitute the presbytery (formerly sometimes called cæsaris) of a defined district, having a general superintendence of the congregations; to it appeal may be made from the congregations. Since the Reformation the churches still retain as part of the regular organisation the synod, consisting of a number of presbyteries in a province, and a court of appeal from presbyteries; other churches dispense with this intermediate court. The General Assembly or General Court is the highest form of the presbytery, and consists of all the presbyteries or their representatives.

Presbyterianism was for a short time dominant in England, but is now most fully represented in Scotland, the north of Ireland, the British Colonies, and the United States. The alliance of the Reformed Churches in the United States was founded at London in 1875, and has held 'Pan-presbyterian' councils at Edinburgh (1877), Philadelphia (1880), Belfast (1881), London (1888) Toronto (1892), Glasgow (1896), and Washington (1898). All churches are eligible 'having a creed in burhaviour which the confesions of the Reformed Confessions.' In 1896 there were 28 Presbyterian churches on the continent of Europe, 12 in the United Kingdom, 16 in North America, 7 in Australia, 2 in New Zealand, and 21 scattered over the rest of the world—80 in all, of which 67 were in the alliance. There were in all 25,564 Presbyterian church buildings, 25,477 ministers, and 4,527,140 communicants.

England.—The principles of the Puritans (q.v.) were essentially Presbyterian, although many of them were so much occupied with questions of doctrine and discipline, and with resistance to power exercised, as they believed, contrary to the word of God, that they paid little heed to the development of their principles in church government. Yet in 1572 a presbytery was formed at Wandsworth, in Surrey, by ministers of London and its suburbs, and other presbyteries were shortly formed. In England, and other presbyteries were soon formed, notwithstanding the extreme hostility of Queen Elizabeth. When the Westminster Assembly met in 1643 the Puritans of England were generally inclined to adopt Presbyterianism as their system of church government, although some still preferred a modified Episcopacy, and some had adopted the principles of Independency or Congregationalism. The Presbyterians were, however, the strongest party at the beginning of the Civil War, although the Independents gained the ascendency afterwards. The establishment of a Presbyterian form of government in the Church of England was voted by parliament (the Long Parliament), 13th October 1647; but it was never really established. The influence of the Independents prevented it. London and its neighbourhood were, meanwhile, formed into twelve presbyteries, constituting the Provincial Synod of London, which continued to hold regular half-yearly meetings till 1655, the meetings of presbyteries being continued till a later date; but the whole Presbyterian system was overturned by Cromwell's Committee of Triers, appointed for the purpose of bringing all dissenting and appositeness to any Ecclesiastical office. Cromwell's policy aimed at bringing all ecclesiastical matters under the immediate control of the civil power. The Restoration was followed by the fruitless Savoy Conference (q.v.), and soon after by the Act of Uniformity, which came into force on 24th August 1662; and on that day about 2000 ministers in England and Wales resigned their benefices, or submitted to be ejected from them, for conscience' sake. The first Nonconformists were mostly Presbyterians, but a small minority of Independents among them. The system of regular Presbyterian system, and the consequence was that the Nonconformists of England became in general practically Independent. Antinomianism and Arminianism soon appeared among them, and were followed by Socinianism or Unitarianism which, although such confessions of faith are not yet come synonymous in England with Socinian or Unitarian; old endowments, legacies of Presbyterians, being now in many instances enjoyed by Unitarians. Meanwhile, there sprang up in England a few congregations connected with the Church of Scotland, and in 1834 was formed the 'Secession Church,' now the United Presbyterian Church. The number of such afterwards very much increased. At the time of the formation
of the Free Church of Scotland (q.v.) the greater number of the English Presbyterian churches con-
ected with the Church of Scotland sympathised with the cause of the Free Church, and took the name of the Presbyterian Church in England. In 1876 a union, which had been long desired, was consummated between the synods more intimately related to the Free Church of Scotland and the congregations below the cause united in the name of the Presbyterian Church. The name assumed by the united church is the Presbyterian Church of England. At the time of the union the Presbyterian Church in England had about 150 churches, and the United Presbyterian Church more than 100. At the same date the Church of Scotland in England had about twenty congregations.

Scotland.—The Presbyterian Churches of Scot-
land are separately treated in the articles SCOT-
LAND (CHURCH HISTORY), FREE CHURCH OF
SCOTLAND, UNITED PRESBYTERIAN CHURCH, and
CAMERONIANS.

Ireland.—The Irish Presbyterian Church originated in the settlement of Ulster by Scottish coloni-
dists during the reign of James I. After various struggles a Presbyterian church was founded by the formation of a presbytery at Carrickfergus in 1689. The body rapidly grew, and greatly increased in number by immigration from Scotland about the middle of the 17th century; and, notwithstanding many difficulties, from the opposition of prelates and of the civil power, the church continued to grow. One very curious fact is that the Presbyterian ministers received a pension from government, under Charles II., in 1672, which Regium Donum (q.v.), however, was not regularly paid until the reign of William, when it was aug-
mented, although only to the paltry amount in all of £20. By William III. it was increased, and augmented, till it reached the amount of £70 for each minister. A seminary for the education of ministers was erected at Killaloe; and in 1710 the synod of the Presbyterian Church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history the Irish Presbyterian Church experienced the utmost opposition from the High Church party. Afterward dissensions sprang up within it, and these with reference to the most important doc-
tines. A body opposed to the doctrine of the Westminster Confession of Faith was set up in the Presbytery of Antrim. But the doctrine of the Westminster Confession was more and more departed from in the Irish Presbyterian Church itself, which became to a large extent Arrian or Unitarian. In 1830 a separation took place from the Irish, who then formed the Remonstrant Presbytery of Ulster. In 1840 a union took place of the Irish Presbyterian Church forming the Synod of Ulster and the Secession Church in Ireland, an offshoot of the Scottish Secession Church, which then reckoned 141 congregations in the north of Ireland. The Irish Presbyterian Church, adhering to the Westminster Confession, in 1889 had 620 ministers, with 102,957 communicants (Presby-
terian pop. at 1891 census, 446,687), and it has not only displayed much zeal for the advance-
ment of the gospel, but has given itself also to the Christianization of other parts of the world, and supports a very successful mission in Gujarat and Manchuria. The act dis-establishing the Irish Church in 1869 provided also for the dis-
continuance of the Regium Donum. Presbyterian churches of annuities for life to ministers already entitled to it; and further gave power for commutation of annuities for a capital sum, of which advantage has been taken to a very large extent, so that a fund has been formed for paying annuities and leaving a large surplus as the

nucleus of a Sustentation Fund for the ministers in time to come. There are two colleges—one purely theological, at Belfast, with seven profes-
sors; the other, the Queen's College, with two professors and a complete curriculum. The colleges were empowered in 1881 jointly to grant degrees in theology.

United States.—The first Presbyterians in America were emigrants from Scotland and Ireland. The first Presbyterian congregations in America were organised in Maryland before the close of the 17th century—the oldest that of Rehoboth, dating about 1660—and the first presbytery in Philadelphia in 1765. A synod, consisting of four presbyteries, was constituted in 1716. Dissensions ceased; but in 1738 the American Presbyterian churches were united in one; and in 1788 a General Assembly was instituted, the whole number of congregations being then 419, and of ministers 188. The increase of the church was rapid, and in 1834 it contained 22 synods and presbyteries, and about 1900 ministers. In 1801 a scheme of union was adopted between Presbyterians and Congregationalists, under which hundreds of congregations were formed in the state of New York and elsewhere. About the beginning of the 19th century the Cumber-
land Presbyterian Church was reorganised. The number of ministers has been augmented, till it reached the amount of £70 for each minister. A seminary for the education of ministers was erected at Killaloe; and in 1710 the synod of the Presbyterian Church resolved to institute the preaching of the gospel to the Irish in their own language. During this period of its history the Irish Presbyterian Church experienced the utmost opposition from the High Church party. Afterward dissensions sprang up within it, and these with reference to the most important doctrines. A body opposed to the doctrine of the Westminster Confession of Faith was set up in the Presbytery of Antrim. But the doctrine of the Westminster Confession was more and more departed from in the Irish Presbyterian Church itself, which became to a large extent Arrian or Unitarian. In 1830 a separation took place from the Irish, who then formed the Remonstrant Presbytery of Ulster. In 1840 a union took place of the Irish Presbyterian Church forming the Synod of Ulster and the Secession Church in Ireland, an offshoot of the Scottish Secession Church, which then reckoned 141 congregations in the north of Ireland. The Irish Presbyterian Church, adhering to the Westminster Confession, in 1889 had 620 ministers, with 102,957 communicants (Presby-
terian pop. at 1891 census, 446,687), and it has not only displayed much zeal for the advance-
ment of the gospel, but has given itself also to the Christianization of other parts of the world, and supports a very successful mission in Gujarat and Manchuria. The act dis-establishing the Irish Church in 1869 provided also for the dis-
continuance of the Regium Donum. Presbyterian churches of annuities for life to ministers already entitled to it; and further gave power for commutation of annuities for a capital sum, of which advantage has been taken to a very large extent, so that a fund has been formed for paying annuities and leaving a large surplus as the

nucleus of a Sustentation Fund for the ministers in time to come. There are two colleges—one purely theological, at Belfast, with seven profes-
sors; the other, the Queen's College, with two professors and a complete curriculum. The colleges were empowered in 1881 jointly to grant degrees in theology.

Presbytery. For presbytery as a part of Presbyterian church government, see the preceding article. In ecclesiastical architecture the presbytery is the space in the choir of a church in which the high altar is placed; the name is sometimes extended to the whole choir.

Prescot, a manufacturing town of Lancashire, 8 miles E, by N. of Liverpool. It has manufactures (in Lancashire; 1788) of watches, clocks, small files, &c., and there are potteries near it. Prescot was the birthplace of John Kemple. Pop. (1851) 7393; (1891) 6453.

Prescott, a city of Arizona, lies in a picturesque mountain-valley, some 6000 feet above the sea-level, 157 miles by rail N.W. of Phoenix, the capital of the territory; mountains of from 7000 feet to 10,000 feet altitude nearly surround it. Gold and silver are found in the neighbourhood, and daily lines of the United States mail coaches connect it with the numerous mining camps round about. Besides bullion, it has a trade in lumber and wool. Pop. (1880) 1836; (1890) 5339.

Prescott, William Hickling, historian, was born at Heswall, Cheshire, Sept. 14, 1796. His father was a prosperous lawyer; his grandfather, Colonel William Prescott (1726—95), was a distinguished soldier in the Revolution, to whose memory a statue was erected on Banker Hill in 1811. He entered Harvard College in 1811, and graduated in 1814. Early in his college course he had his left eye blinded by a piece of bread playfully thrown by a fellow-student, and the other was soon sympathetically affected, so that he was obliged to live for months in a darkened room. He next travelled in England, France, and Italy, married in 1829, and abandoned the study of law for literature. He now devoted himself to severe study, and formed splendid literary projects, in spite of the grievous disadvantage of being able only to use his remaining eye for brief periods. His first studies were in Italian literature, and it was not till the beginning of 1826 that he had found the work of his life within the range of Spanish history. Fortunately his means were ample, so that he was able to procure the services of assistants, and to live amid conditions of comfort. By constant habit he gained the power of carrying a great amount of mental work, and he so revered the whole of a chapter in his mind he quickly transferred it to paper by means of his stylus and an ingenious writing-case specially constructed for the blind. His first secretary knew no Spanish, yet he went through the seven quarto volumes of Mariana's History, with him. So he laboured with almost unexampled courage and patience at his History of Ferdinand and Isabella (3 vols. Boston, 1838), which quickly carried his name across the ocean to the Old World, and was speedily reprinted in the way of French, Spanish, and German. He next devoted six years to the History of the Conquest of Mexico (3 vols. 1843), and four years to the Conquest of Peru (2 vols. 1847). These works deservedly brought him a great reputation; he was chosen a corresponding member of the French Institute, and on a visit to Europe in 1850 was received with the highest distinction. In 1855 he published two volumes of his History of Philip II., and a third volume in 1858, but died of apoplexy before its close at Boston, January 28, 1859. Prescott's style is at once more comprehensive and more finished than any he had hitherto employed, and to this day he remains unrivalled among English historians for vigorous and direct narrative and for sustained splendour of colour. His imagination worked all the more freely because he saw but with the inward eye, and the splendid visions that it wove gave him a poetic fancy the charm of which to this day there remains unrivalled among English historians for vigorous and direct narrative and for sustained splendour of colour. His imagination worked all the more freely because he saw but with the inward eye, and the splendid visions that it wove gave him a poetic fancy the charm of which to this day remains unrivalled among English historians for vigorous and direct narrative and for sustained splendour of colour. commence each prescription with the symbol B, which signifies *recipe* 'take.' As an illustration, we append a prescription for a tonic draught (where $f.$ stands for fluid ounce; $j.$ for fluid dram; $m.$ for minim; *gr.* for grain; M. for *missce, *mix*):

(Name of Patient.)

B. Quinua Sulph., gr. j.
Tinct. Calomel., f. j.
Acid. Sulph. Dilut., $m.$
Syrup. Aurant., f. j.
Infls. Calumbe, ad $f.$ j.
M. Fiat Haustus ter quotidie sumendas.

Date. (Initials or name of prescriber.)

As a parallel to this retention in western Europe of a medieval usage, it may be mentioned that in the pelmy days of the republic of Athens the Attic-speaking practitioner was held bound to write his prescriptions in the ancient Doric dialects; the reason in this case being that the schools of medicine in the Doric colonies of Magna Gracica and elsewhere were long the most celebrated.

**Prescription.** In Roman law, means a clause inserted in any bill or act, by which an (unliquidated) demand for an action was tried. The prescription *longi temporis* directed that the claimant should not succeed if the defendant had been so long in possession of the property in dispute that equity would not allow him to be disturbed. In England lapse of time may affect rights in various ways. The right of a claimant to bring an action may be taken away by statutes of limitation (q.v.), or the law may regard the long enjoyment of the possessor as evidence to show that his rights had a lawful origin. Possessory title to land is now gained under the extent of an estate, by the statute of limitation. In proving title by prescription to easements (such as rights of way, ancient lights, &c.) and other incorporeal rights over the land of another the claimant relies on immemorial enjoyment; but the courts would always infer the immemorial character of the right from a comparatively short period of actual enjoyment. And now, under the Prescription Act of 1832, the period is fixed at twenty years in the case of lights and other easements and thirty years in the case of other incorporeal rights (as common of pasture, and the like). For the rules of the act, see Shelford's *Real Property Statutes.*

In the law of Scotland prescription is a method both of acquiring and of losing a right; hence it is divided into positive and negative. The positive prescription of better title, *prescription of limitation,* is by the act of 1790, chap. 12. As that statute has been interpreted by decisions, possession of heritable subjects for forty years, on the requisite titles, recorded in the appropriate register, is sufficient to secure an owner against any one alleging a better title; or to determine the extent of an estate, where a question arises either as to what is comprehended under a general description or as to whether a specific piece of property has been carried under a clause of parts and pertinents; or to merge a title of property in the higher title of superiority. The possession must be uninterrupted and co-extensive with the right claimed. The Convocation Act, 1874 (37 and 38 Vict. chap. 94 sect. 34), simplified the title necessary for founding prescription, by enacting that 'any *ex facie* valid, irredeemable title, recorded in the appropriate register, shall be sufficient;' and shortened the prescriptive period by enacting that possession for twenty years continually and together, following on such recorded title, shall be equivalent to possession for the old period of forty years.

The negative prescription of obligations was first introduced by the Statute 1469, chap. 29, which declares that unless a person follow an obligation and take document thereon within forty years, his right shall prescribe and be of no avail. By the Act 1617, chap. 12, this prescription was extended to heritable bonds and other heritable rights, and it was enacted that the years of minority of the party against whom the prescription was used should not be counted. In addition to these long prescriptions there are several shorter prescriptions, whose object, generally speaking, is to protect third parties against the consequences of negligence in preserving vouchers and, after the expiration of the prescribed period, to enable them to bring actions and to take the benefit of pro bono and to restrict the mode of proof. Among these lesser prescriptions are the vicennial prescription of twenty years, applicable to returns and holograph writings; the ten years' or decennial prescription, applicable to actions against tutors and curators; the septennial prescription of cautionary obligations; the sexennial prescription of bills of exchange; the quinquennial prescription of arrears of rent in an agricultural lease, of ministers' stipends, of bargains concerning movables made verbally, and of inquisitions; the triennial prescription of the act of 1707, applying to cases of a barrister and solicitor's right to actions for servants' wages, for house-rents, or for accounts to attorneys, surgeons, agents, &c. In Scotland if, within twenty years after the commission of a crime, no step has been taken to bring the offender to justice, it would appear that the right to prosecute falls to the ground.

**Prescument.** See Criminal Law.

**Preserved Provisions.** Under the term *preserves* is usually included fruit, eaten whole or broken, or the juice of fruit, preserved by boiling with sugar, which is made in such a manner that the sugar penetrates the fruit completely. It is then drained and dried at a gentle heat, so that the absorbed sugar crystallises in the substance and on the surface of the fruit, which is then known as *jellied.* Jam consists of fruit boiled with an equal weight of sugar, which latter dissolves in the fruit juice set free as the fruit breaks down. If well made they can be preserved in this manner for years, but the quality deteriorates after twelve or eighteen months, owing to crystallisation and other changes taking place in the sugar. Fruit jellies consist of the juice of the fruit only, boiled with sugar, this vegetable jelly consisting principally of a substance known to chemists under the name of *pectin.* Fruits are also preserved by covering with water in suitable vessels, heating to a high temperature, and closing the vessel whilst hot.

Meat, vegetables, and other provisions may be preserved with more or less success in a number of ways, which may be classed roughly under four headings: (1) desiccation; (2) use of cold; (3) by chemical compounds (antiseptics); (4) by exclusion of air. The simple process of drying is effective both with meat and vegetables, and if completely carried out prevents the ordinary putrefactive changes from taking place. Dried vegetables are chopped large for use in cold ship's soup and soup tablets so extensively used nowadays consist of meat and vegetables dried and pressed together. Jerked Beef (q.v.) and Pemmican (q.v.) are prepared chiefly by drying in the sun. The use of cold is mainly a temporary expedient employed for the carriage of meat from one country to another. This industry is carried on extensively in America, Australia, and New Zealand. The case is frozen hard by a refrigerating machine, and packed on board ship in a chamber cooled by a similar apparatus. Meat so transported in Europe in good condition, and if properly thawed is superior to all but the best home-grown beef
and mutton (see Refrigeration). For condensed milk, see Milk.

Certain chemical substances have the power to prevent decay or arrest putrefactive changes, by destroying the activity of the germs or fermenters which cause putrefaction, and these have been variously applied for the purpose of preserving meat (the food-value being thereby somewhat decreased); the meat may be immersed in brine, packed in salt, rubbed with salt and dried, or salted and smoked. The method of salting and smoking a ham is described at HAM; the chief preservative element in the wood-smoke is cresote. Cresote, boracic acid, salicylic acid, and sulphur compounds are all substances that can be used as food preservatives, but the objection to the use of chemical agents is that they either have a distinct taste themselves or have a toxic influence on the human body. Salicylic acid has been used in large quantities for preserving milk and other foods, but, when taken even in small doses for a lengthened period, it disturbs the animal economy; and in France any food preserved by its means is marked as such to prevent its use. The use of cresote is confined to meats which are usually smoked. Boracic acid has no taste, and in all probability is harmless when taken in the small quantities present in food preserved by its means. Milk, fish, poultry, and most of all kinds may be preserved with it. A very ingenious method of using this preservative has been tried with success. The boracic acid is injected into the large vein of an insensible but living animal, so that it is carried in the ordinary circulation to all parts of the body, and the animal dies in a state so prepared that it has become fresh and paintable for about three months. Some sulphur compounds, notably the bisulphite of lime and sulphurous acid, are good preservatives, but they have an objectionable taste. The former is used by butchers as a preserver of meat in hot weather.

Exclusion of air is a method of preserving which is used almost exclusively for cooked foods. Various plans of coating meat with air-tight coating have been tried, but they have been carried little further than the experimental stage. More efficient has been a plan of preserving meat in tins, gutta-percha, &c.—all of which exclude air; but the air, or, more correctly, the germs present in the air, are imprisoned in the tissues of the meat, and these specifically set up putrefactive changes. The only method sufficiently effective to accomplish the desired end is by the use of high temperature to expel the air and destroy the germs, and then sealing to prevent ingress of more air. Many have claimed the credit of this invention, but in all probability it was first proposed by a M. Appert of Paris in 1810. The process now carried on, however, is the outcome of many minds. Appert's original method simply supplying the groundwork. The various tinned meats, soups, &c., now in the market are examples of this method of preserving food. The meat, &c., is placed in tins, which are immersed in a solution of calcium chloride heated up to a temperature of 270° F., which destroys both germs and spores. The tins are previously closed, except a small pin-hole for the escape of steam. They are heated thus for about three hours, when the pin-holes are closed with solder, and the tins allowed to cool. This process is thoroughly successful as far as the prevention of putrefaction goes. Tins of meat thus treated have been opened after twenty years, and no sign of putrefaction has been noted; occasionally through some carelessness the air may not have been thoroughly removed, and putrefactive changes; such exceptions, however, are rarely met with in this sort of process. Good firms. A bad tin can be detected before opening by the bulged-out appearance of the tin, the gasses of decomposition pressing out the sides or ends. The objection to the process lies in the water-cooking to which the meat must be subjected. This impairs its nutritive value, and the high temperature no doubt removes some of the nutritive value of the meat, although this latter point is denied by some. Other plans, varying somewhat in detail but similar in principle, have been patented, and are in use in some of the food-preserving factories. Aberdeen and London are large for this industry, the former having five factories, whilst in America and New Zealand (q.v.) a large amount of capital is invested in the trade. See Salmon.

The various extracts of meat are in a way preserved foods. They consist of the juices and extractive matter of the meat evaporated down to a thick consistence, and frequently preserved by a large addition of salt. The majority of these extracts are stimulants rather than foods, some of them being practically useless. Vegetables are frequently preserved by the process of pickling. The vegetable being treated similarly to meat, and the latter two substances, being antiseptic in their nature, prevent putrefaction and decay. For the preservation of wood, see DRY ROT.

Presidency. See India.

President of the United States, the head of the executive of the United States, is also the only executive officer who reaches his position by election; the appointment of the others being either in his hands (subject to their confirmation by the Senate) or regulated by law. The president is elected for a term of four years; eight presidents—Washington, Jefferson, Madison, Monroe, Jackson, Lincoln, Grant, and Cleveland—have been chosen for a second term, but a third term, although there is nothing in the constitution to prevent it, is practically impossible, by the clause in the constitution against it. A candidate must be a natural-born citizen of the United States, not under thirty-five years of age. The president has a salary of $50,000 a year, and must receive no other emolument during office from the United States or any state. He is elected by the people of the United States, and of the militia when in the actual service of the Union; he has the power to grant reprieves and pardons for offences against the United States, except in cases of impeachment, and (by and with the advice and consent of the Senate) to appoint ambassadors, consuls, and all other officers of the United States whose appointments are not otherwise provided for; from time to time he sends to Congress a 'message' (cf. the 'Queen's Speech') giving information as to the state of the Union, and recommending measures for consideration; he may convene both houses, or either house, in special session; and, if the two houses disagree as to the time of adjournment, he may adjourn them to such time as he thinks fit. The president, like the vice-president and all other civil officers, may be removed from office on impeachment by the House of Representatives for and on conviction by two-thirds of the Senate of treason, bribery, or other high crimes and misdemeanours. He may require the opinion, in writing, of the head of any of the executive departments on any subject relating to the duties of his department. The president possesses the power of convening the President's signature to become a law, unless, after he has returned it with his objections, two-thirds of each house support it and pass it over his veto.

The Vice-president of the United States, although elected along with the president, is not part of the executive department. His sole function in to
PRESIDENT

PRESIDIO, a Spanish word for 'a fort,' applied especially to four Spanish fortified posts on the coast of Mexico—Centa, Melilla, Almeenas, and Poison de Ysa.

Press, Freedom of the, the expression used to denote the absence of any official restraint on the publication of books and other printed matter. In England, at the Reformation, the control of the press came to be centred in the crown, the ecclesiastical in addition to the secular government being vested in the hands of the Vicar and Chapter of the church. The Company of Stationers, who came to have the regulation of printing and publishing, were servants of the government, subject to the control of the Star Chamber. The censorship of the press was enforced by the Lord Parliament, in spite of Milton's eloquent protest (see his Areopagitica), and was re-established more rigorously at the Restoration. It was continued at the Revolution, and the statute regulating it was renewed from time to time till 1663, when the Commons by a special vote struck it out of the list of temporary acts to be continued. Since that time the censorship of the press has ceased to exist in Britain. But, though there are no official restrictions on what shall and what shall not be published, the authors and publishers of criminal or injurious matter are subject to the classes of rule; and there are certain statutory requirements in force to enable them to be traced. Every person who prints anything for hire or reward must, under a penalty of £20, keep one copy at least of the matter printed, and write on it the name and place of abode of the person who employed him to print it. Every person who prints any paper meant to be published must print on the first or last leaf his name and usual place of business; and on failure to do so he forfeits the sum of £5, and so does any person publishing the same. There are a few printed papers governed by the above requirement—as, for instance, papers printed by parliament or in government offices, engravings, auction lists, bank-notes, bills of lading, receipts for money, and a few other similar matters. In the case of a libel legal publication is constitutive of the action, and every copy printed or in manuscript to any person; the sale of a newspaper or other publication in a shop, or its delivery to an officer at the Stamp-office, is also considered an act of publication. The truth of the statement published is, however, no plea of defence in an action for libel; in criminal proceedings truth is a defence if the publication is for the public benefit. The publisher of a book or newspaper may also defend himself by showing that the matter complained of was published by order of either House of Parliament, that it is a fair criticism on a public person or act, or that it represents the honest belief of the defendant, and is published by him in the course of his official or moral duty. If a bill shall be filed in any court for the discovery of the name of the printer, publisher, or publisher of a newspaper, or of any other publication, with the view of rendering him liable in damages for slanderous matter, the defendant is bound to make the discovery required, which, however, cannot be made use of against him in any other proceedings, or of any proceeding that he may make. The penalties against newspapers can only be sued for in the name of the Attorney-general or Solicitor-general, or Lord Advocate. Certain regulations also exist regarding the exhibition of plays (q.v.). Subject to these restrictions, the freedom of the press has subsisted in Britain at least since 1693. At least an equal degree of freedom obtains in the United States, where privilege is much more widely extended. See Libel.

A more or less rigorous censorship of the press
exists in most European states. There is often no direct supervision previous to publication, but the official censor has it in his power to stop any publication which he deems objectionable, to confiscate the edition, and to prosecute the author and editor. Newspapers and pamphlets are generally subjected to a stricter censorship than larger works. See J. Lynd, Olders on Libel, and Paterson on the Liberty of the Press.—For Correction of the Press, see PROOFS.

Pressénsé, EDMOND DE, a prominent French Protestant theologian, was born in Paris, January 24, 1824, studied at the university there, next under Vinet at Lausanne, and Tholuck and Neander at Halle and Berlin; and in 1847 became a pastor at Paris. He was deputy to the National Assembly for the Seine department in 1871-76, and was elected a senator for life in 1883. He received the D.D. degree from Breslau in 1869 and Edinburgh in 1884. He died April 8, 1891. A strong thinker and vigorous writer, as well as an eloquent演说家, Pressénsé took a foremost part in the great theological as well as ecclesiastical controversies of the day; published many learned and important books, most of which have been translated into English and German; and contributed to the leading French theological magazines on both sides of the Channel—the article on Christianity in the present work is from his pen.

The following are the most important books: Le Rédempteur (1854; Eng. trans. 1864); Histoire des Trois Premières Sibylles de l'Eglise Chrétienne (4 vols. 1858-57; Eng. trans. 1860-63); Le livre de Jésus Chrétien (1869; Eng. trans. 1872); La Conception du Christ (1880; Eng. trans. New York, 1880); and Les Origines (1882; Eng. trans. 1883).

Pressgang. Impression was the mode formerly resorted to for manning the British navy. The practice had not only the sanction of custom, but the force of law. It may be traced in English legislation from the days of Edward I. and many acts of parliament, from the reign of Philip and Mary to that of George III., were passed to regulate the system of impressment. Impression consisted in seizing by force, for service in the royal navy, seamen, river-watermen, and at times landmen, when they were engaged in earning their livelihood. The pressgang, an armed party of reliable men commanded by officers, usually proceeded to such seaports in the seaport towns as were supposed to be the resort of the seafaring population, laid violent hands on all eligible men, and conveyed them forcibly to the ships of war in the harbour. As it was not in the nature of sailors to yield without a struggle many terrible fights took place between the pressgang and their intended victims—combats in which lives were often lost. In point of justice there is little, if anything, to be said for impressment; it had not the merit of an impartial selection from the whole available population. Under the laws all eligible men of seafaring habits were liable between the ages of eighteen and fifty-five; but exemptions were made in favour of apprentices, seamen and mariners, fishermen at sea, a proportion of able seamen in each collier, bargemen in wharves, and a few others. A pressgang could board a merchant-vessel or a privateer of its own nation in any part of the world, and carry off as many of the best men as it pleased without letters of marque or licence, or any notice of seamen in the vessel. The exercise of this power made a privateer dread a friendly man-of-war more than an enemy, and often led to an exciting a chase when enemies were in pursuit of each other; for the privateer's men were the best sailors, for their purpose, that the naval officers could lay hold on. Mitigations of the harsh laws on the subject were frequently introduced. As early as 1563 the naval authorities had to secure the sanction of the local justices of peace; in 1585 the term of an impressed man's service was limited to five years save in urgent cases. By the navigation laws, the system became obsolete; the navy was manured by voluntary service. In recent times, when volunteers fail, a system of bounty has been resorted to. But the laws sanctioning impressment slumber, without being repealed.

Pressing to Death. See Peine Forte et Dure.

Prester John, the name applied by medieval credulity for two hundred years to the supposed Christian sovereign of a vast but ill-defined empire in central Asia. The idea of a powerful Christian potentate in the far East, at once wise and just, was universal in Europe from about the middle of the 12th to the beginning of the 14th century, when it was transferred to Ethiopia and finally found a fancied historical justification in identification with the Christian king of Abyssinia.

The conception of a Prester John, sprung from the ancient race of the Magi of the Gospels, occurs in the Chronicle of Otto, bishop of Freisingen. Here, on the authority (1145) of the bishop of Gubala (Jiblal in Syrian), we find a circumstantial account of his power, his Christianity after the Nestorian pattern, his victories over the Medes and Persians, and how his progress to Jerusalem was stayed by the intervening Tigris, which refused to give over to him passage. Again, about 1165, there was widely current in Europe an extravagant romance supposed to be addressed by Prester John to the Greek emperor Manuel. Here we read astounding wonders enough: how that he ruled over the three Indies and countless hordes of men, among them those unclean races which Alexander the Great shut up within the northern mountains; that thirteen great elephants, gold and jewels were borne before as many armies, each of 10,000 knights and 100,000 foot; that all his subjects were virtuous and happy; attendant upon him were seven kings, sixty dukes, and 365 counts, twelve archbishops, and twenty bishops, while seventy-two kings with their kingdoms were his tributaries; that before he left his house he saw everything that was happening in all his vast dominions; his kingdom contained the Fountains of Yonuth, the Sea of Sand, the River of Stones, and the river whose sand was precious gems, ants that dig gold, fish that yielded purplish pebbles that give light and make invisible, and the salamander which lives in fire, from the inc postponable covering of which were fashioned robes for the presbyter to wear. There is also extant a letter of date 1177, written by Pope Alexander III., and addressed not to the imaginary author of the grandiloquent epistle of 1165.

About the year 1221 the distant rumour of the conquests of Ghenghis Khan again gave strength to the belief in such a mighty Christian potentate. M. d'Avezin first pointed out the true historical source of the Prester John romances in the Yolien Toshi, founder of the empire of Kure-Khati, who assumed the title of Gur Khan (supposed by Oppert to have been confounded with Yakkanan or Johannnes), and fixed his capital at Balasaghun, north of the Tian Shan range. He defeated Sanjar the Seljuk and overran the Uighurs; he finally entered and plundered the Song and Tungarkand, but, though hostile to the Moslem historians, of course never made any profession of Christian faith. Professor Brun of Odessa identifies Prester John with the 12th-century Georgian prince John Orbelian, a redoubtable enemy of the Turks.
Preston

an important manufacturing town of Lancashire, a municipal, parliamentary, and county borough, about 3 miles S. of Manchester, and 209 NNW. of London. Occupying an elevation 120 feet above the river, and built mostly of brick, it is on the whole well laid out, and is surrounded with pleasant scenery.

The town was built on a plan of 1802–07 from designs by Sir G. G. Scott at a cost of £80,000, is a French Gothic pile, with a clock-tower and spire 193 feet high. In September 1822 were laid the foundation-stones both of the Lancashire county hall and of the Harris free library and museum, latter of which was opened 1854. M. R. Newbush bequeathed a collection of pictures and art-treasures worth £70,000. The places of worship are all of them modern, for even the parish church has been rebuilt.

St. Walburges (Ionian Catholic), by Hansom (in 1811) has an arc of 305 feet high, the loftiest built in England since the Reformation, which amply redeems 'prond Preston' from its old 'no-steeple' reproach. Other edifices are the grammar-school (1590; rebuilt 1841), the corn exchange and market-house (1824), public library and museum, covered market (1876), militia barracks (1856), the infirmary (1859), &c. Three large public parks were laid out in 1867—the Miller and Avenham parks, and the former insightly 'Moor' of 100 acres to the north of the town. In the first a statue was erected in 1873 of the fourteenth Earl of Derby; in Winckley Square is a monument to Sir Robert Peel. Preston was constituted an independent port in 1843; and great improvements have been effected at a cost of three-quarters of a million under the 'Ribble Navigation and Preston Dock Act, 1883,' these including the deepening of the channel so as to admit vessels of 1000 tons, the construction of a dock of 40 acres, the erection of warehouses, &c. Arkwright (q.v.), who was born here in 1732, in 1768 set up here his famous spinning-frame; and Preston now is one of the principal seats of the cotton industry, which greatly assisted the linen manufacture, its staple in the 18th century. There are also iron and brass foundries, iron ship-building yards, engineering and machine shops, steam-boiler works, rope-walks, &c. A guild-merchant festival, first clearly held in 1597, has been held regularly every twenty years since 1562—last the 4th September 1882. Preston, the first of whose royal charters was granted by Henry VI., returns two members to parliament. The borough boundary was extended in 1883.

Preston arose whilst ancient Cocceum or Ribchester, higher up the Ribble, decayed. In Athelstan's reign Amounderness, the hundred in which it is situated, was granted to the cathedral church of York; hence its chief town came to be known as Preston or 'priests' town.' Near Preston, on 17th August 1648, Cromwell totally routed the royalists under Sir Marmaduke Langdale; and Preston figures in both the Jacobeans' rebellions of 1715 and 1745. For Forster's little army surrendered here to General Willes; and Prince Charles Edward occupied the town on both his march to and his retreat from Derby. Lady Hamilton has been claimed, but falsely it seems, as a native of Preston.

Livesey of Preston and six others here signed a pledge of total abstinence—the first ever taken in England.

See works by Whittle (2 vols. 1821–27), Dobson (four, 1856–62), Hardwick (1867), Abram (1892), and T. C. Smith (1893).

Prestonpans, a coast-town of Haddingtonshire, 8 miles E. of Edinburgh. Its salt-pans flourished from the 12th century till 1825; now brewing and fishing are the principal industries. Pop. 2623.

To the south-east, on 21st September 1745, was fought the battle of Prestonpans, Preston, or Gladsmuir, when in a five minutes' rush Prince Charles Edward's 2500 Highlanders completely routed 2390 disciplined soldiers under Sir John Cope and Colonel Gardner (q.v.).

Prestwick, a cotton manufacturing town of Lanarkshire, 4 miles N.NW. of Manchester, with a 136th century Gothic church. Pop. (1901) 7800.

Prestwick, Sir Joseph (1812–90), was a London wine-merchant, and in 1874 became professor of Geology at Oxford, and in 1896 was knighted. See the Life by his wife (1899).

Prestwick, the headquarters of golf on the Ayrshire coast, 2½ miles N. of Ayr; pop. 2000.

Presumption, an inference drawn by the law in certain circumstances, and used to start an argument. A person who has possession of goods is presumed to be the owner till the contrary is proved. A man is presumed to be innocent till the contrary is proved. The law of England presumes that any one who has not been heard of for seven years is dead. By an act of 1881 for Scotland the heir of a person who has disappeared for seven years may obtain authority to uplift the annual income, and thirteen years later may obtain full possession of the inheritable estate of the person presumed to be dead; for securing full right to inherit and dispose of movable estate, the person must be dead for fourteen years.

Pretender. See Jacobites, Stewart.

Pretoria, the capital of the South African Republic (Transvaal), 880 miles by rail (1893) from Cape-town and 205 miles W. of Johannesburg, on Delagoa Bay, to which a railway was opened in 1895. Pretoria was founded in 1855 by the Boer leader Pretorius, has broad streets, and pure water. It owes its prosperity chiefly to the gold-mines at Johannesburg, about 20 miles distant. New public buildings were erected in 1891. Pop. 8000.

Preventive Officers. See Coastguard.

Preveza, or Preveza, a fortified town in the extreme south-west of European Turkey, stands on the north side of the entrance to the Gulf of Arta. It exports valonia acorns, wool, cotton, and oil. The Venetians held the town from 1603 to 1707. One year later Ali Pasha drove out the French garrison and plundered the place.

Prévost. Abbé. Antoine François Prévost, d'Exilles, commonly called the Abbé Prévost, and
immortal as the author of Manon Lescaut, was born of good family at Hesdin in Artois, 1st April 1697. He was educated by the Jesuits at Hesdin, and at the Collège d'Harcourt in Paris, at sixteen volunteered for service as the last war of Louis XIV. was coming to an end. He spent the next six years in a round of religious duties, in study, and in writing a volume of Gallicia Christiana. About the year 1727, being anxious to be transferred to Cluny, where the rule was less austere, he desisted his permission, and so found himself unexpectedly guilty of the sin of disobedience. He fled to Holland, and spent six years of exile in that country and in England, and there is even a dim story of a love entanglement against which he strove for a while in vain. In 1728 he published the first and best of his long novels, the Mémoires d'un homme de lettres, the narrative of which Lescaut (apparently first published at Amsterdam in 1733) forms a kind of supplement. His fluent pen employed itself in further novels—Cleveland, fils naturel de Crowwel; Le Poêy de Kilkerine—in translations, and in Le Pour et Contre (1735-40), adefence of his life and ideals in the world of the Spectator, and showing an excellent appreciation of English books. By 1735 he was back in France by royal permission, and allowed to wear the dress of the secular priesthood. He was befriended by Cardinal de Bissy, and the Prince de Conti, whose chaplain he became, and for thirty years he wrote assiduously over a hundred volumes of compilations, including a voluminous Histoire générale des Voyages (of which vol. i, 1746, contains a fine portrait by Schmidt), histories, moral essays, translations of Pamela and Clarissa Harlowe, and at least one novel—Histoire d'une Grecque Moderne. In 1741 a literary service thoughtlessly rendered to a satirical novelist drove him from France to Brussels, thence to Frankfort; but he was soon forgiven by M. de Maurepas, and allowed to return. He lived in Brussels in subsequent quantity, walked much in the woods there, and died in the rupture of an aneurism, 23d November 1763. The story of long duration that was after he thought to have died of apoplexy, a stupid surgeon, in haste to begin a post-mortem examination, both brought him back to life. Lescaut killed him with a single thrust of his knife; but this time, the romance first appeared about 1782, and was completely disproved by Harrisso (see his L'Abbé Prévost, 1866). Many other legends have clustered round Prévost's romantic life. Of these the most remarkable is a practically baseless calumny that he killed his own father, who had chid him in an intrigue, by throwing him downstairs.

Prévost's is one of the names lifted securely above the flood of time by one book written in a moment of happy inspiration. Manon Lescaut remains drawing to its clustering, and personal, from its perfect and unaffected simplicity, the stamp of reality and truth throughout, and a style so flowing, easy, and natural, that the reader forgets it altogether in the overpowering pathetic interest of the story. The half-dozen figures portrayed have the life of themselves: the young Chevalier de Grieux, the hero, is a lover of the most transparent, absolutely forgetful of self, and idealizing even the unworthiness of his mistress: Tiberge is an admirable type of the sensible and faithful friend, Lescaut, Macon's brother, of the mufian and bully; but the triumph of the book is Manon herself, charming, light-hearted, shallow, incapable of a love that she will not sacrifice for luxury, yet ever moved with a real affection for her lover, constant even in her inconsistency and her degradation, the goodness ever shining through the guilt, and at last purified by love and suffering. One feels in this union of the heroic and the human, a moment when reality ends and fiction begins, and indeed it remains to this day unequaled as a truthful realisation of one over-mastering passion. From beginning to end a careful reader detects the traces of a real experience, for its author had himself a sensitive heart and a weak and vacillating character. Both a Tiberge and a Des Grieux met in himself, for his character and ideas were pure and elevated, despite the weaknesses that grew out of his passionate and impulsive soul. Compounded, like his hero, at once of weakness and of strength, he is not to be regarded with admiration so much as sympathy and affection, for, if his sensitive and impressionable heart opened a door to frailties ill-befitting the habit that he wore, these frailties at least were natural and not disdained, and did not corrupt his heart any more than their possessor. Anon was to have written:

There is no complete edition of Prévost's works. His Œuvres Classiques were collected at Amsterdam (39 vols. 1783-85). Of his one masterpiece the editions are numberless, and there is at least one fair English translation, by L. E. de Custis (1841); the biography prefixed to Prévost's Pensées (1764), and Sainte-Beuve in Portraits Littéraires, vols. i. and iii., and Études du Lundi, vol. ix.

Prévost-Paradol, Lucien Anatole, French journalist, was born at Paris, son of an actress, 8th August 1820, passed with distinction through the Collège Bourbon and École Normale, and became in 1855 professor of French literature at Aix. Hardly a year later he was at work in Paris on the Journal des Débats and Courrier du Dauphine, and from time to time he published collections of essays on literature and politics, of which the best is his Essais sur les Moralistes Français (1864). In 1865 he was elected to the Academy, and in 1868 he visited England, and was honored at Edinburgh with a public entertainment. He had always been a moderate Liberal, an opponent of the empire, but the accessions made upon him by power in January 1870 seemed to open up a new era for French policy, and he allowed himself to accept the post of envoy to the United States. Sensely was he installed when the war with Germany broke out, and the Prévost-Paradol, his mind unhinged by the virulent attacks made upon him by the republican press, and hopeless of the issue of the struggle before his country, solved his own difficulties by suicide at Washington, 20th July 1870.

Pray, Birds of. See BIRDS OF PRAY.

PriaM, king of Troy at the time of the Trojan war, was the son of Laomedon and Strymo or Phaeac. The name means 'the ransomed,' and was given him on account of his having been ransomed by his sister Hesione from Hecules, into whose hands he had fallen. His first wife was Arisha, daughter of Merops, whom he gave away to a friend in order to marry Helenia, by whom, according to Homer, he had nineteen sons. He had altogether fifty sons: later writers add as many daughters. The best known of these are Hector, Paris, Deiphobus, Helemus, Troilus, and Cassandra. Priam is represented as too old to take any active part in the Trojan war, and in Homer only once appears on the field of battle. After Hector's death he went to the tent of Achilles to beg the body for burial. The oldest Greek legends are silent respecting his fate; but later poets like Euripides and Virgil say that he was slain by Pyrrhus when the Greeks stormed the city.
Priapus, son of Dionysus and Aphrodite, born at Lampsaus on the Hellespont, considered as a divinity of fruitfulness, especially of flocks of sheep and goats, of bees, the vine, and of all kinds of garden produce. His statues usually stood in gardens, in the form of rude wooden images, painted vermilion, with a club, sickle, and phallic symbol of exaggerated dimensions.

Pribram, a mining town of Bohemia, 48 miles by rail SSW. of Prague, employs 6000 men in the royal lead and silver mines, and various manufactories. There is a medical academy, and a hospital, which is much frequented by pilgrims. Pop. (1890) 13,412.

Pribylvod Islands. See Alaska.

Price, Richard, philosopher, was born at Tyn-ton, in Glamorganshire, on 22d February 1723. His father was a dissenting minister, morose, bigoted, and intolerant, in complete antithesis to the disposition of the son. As a boy he read Clarke and Butler, went at eighteen to a dissenting academy, and in London, and at the close of his studies became chaplain to a Mr STreetfald at Stoke-Newington, with whom he lived for thirteen years. Legacies from his patron and an uncle in 1756 enabled him to marry. He behavoured as a preacher at Newington Green and at Hackney, and established a reputation by his somewhat heavy but able Review of the Principal Questions in Morals (1758). His apologetic work, On the Importance of Christianity, appeared in 1766. In 1769 he received from Glasgow the degree of Doctor, and published his Treatise on Reversionary Payments; which was followed by the compilation of the celebrated Northampton Mortality Tables, and various other works of value relating to life assurance and annuities. In 1771 appeared his famous Appeal to the Public on the Hoard of the Nation. Debt; in 1776 his Observations on Civil Liberty and the Justice and Policy of the War with America. The latter brought him the freedom of the city of London and an invitation from congress to assist in regulating its finances. Price lived long enough to herald the promise of the French Revolution, and to be denounced in Burke's Reflections. He died April 19, 1791. Price was a believer in the immateriality of the soul, holding that it remained in a dormant state between death and resurrection. The subscription on this question degenerated to a controversy of some celebrity between him and his friend Dr Priestley. His views respecting the divinity of Christ were what is called Low or semi-Arian. As a moralist he has a close affinity with Culwirth, and in some points strangely fore-shadowed the greater name of Kant. Of his great treatise on morals the chief positions are these: actions are in themselves right or wrong; right and wrong are simple ideas incapable of analysis; these ideas are received immediately by the intuitive power of the reason or understanding. See the Life by his nephew, William Morgan (1814).

Price, Thomas (1727-1848), a distinguished Welsh scholar. See WALES (LANGUAGE AND LITERATURE).

Pritchard, James Cowles, ethnologist, was born at Ross in Herefordshire, 11th February 1766. The son of a Quaker merchant, he received a careful education in schools and in Bristol, where he had many chances of picking up foreign languages. There, at St Thomas's, London, and in Edinburgh he studied medicine; and in 1810, after a residence both at Cambridge and at Oxford, he commenced practice in Bristol as a physician. His talents were soon recognised, and in 1816 he was appointed physician first to the Clifton dispensary and St Peter's Hospital, and afterwards to the Bristol infirmary. In 1813 appeared his Researches into the Physical History of Mankind, which, at once secured him a high standing as an ethnologist. The different editions of this work (4th, 5 vols. 1841-51) gave further proofs of the zeal with which he pursued his ethnological inquiries; and at the same time he devoted himself much to philosophy, to which he rightly judged to be absolutely indispensable for an enlarged study of ethnology. He made himself master not only of the Romance, Teutonic, and Celtic languages, but also of Sanskrit, Hebrew, Arabic, and in The Eastern Origins of the Celtic Nations (1831; 2d ed. by Latham, 1857) he compared the different dialects of Celtic with the Sanskrit, Greek, Latin, and Teutonic languages, and succeeded in establishing a close affinity between them all, from which he argued in favour of a common origin for all the peoples speaking those languages. Besides several medical works, he also published an Analysis of Egyptian Mythology (1819; Ger. trans. by A. W. von Schlegel, 1837) and The Natural History of Man (2 vols. 1843; 4th ed. by E. Norris, 1853). As a tribute to his eminence as an ethnologist, Dr Pritchard was elected president of the Ethnological Society; while in recognition of his researches into the nature and various forms of insanity he was appointed in 1845 a commissioner in lunacy. This occasioned his removal to London, where on 22d December 1846 he died of consumption at the age of 79. The first to raise ethnology to the rank of a science, he was himself a monogenist, maintaining that man is one in species, and that the negro is the primitive type of the human race.

Prickly Pear, or Indian Fig (Opuntia), a genus of plants of the natural order Cactaceae (q.v.), having many stem usually compressed articulations; leafless, except that the youngest shoots produce small cylindrical leaves which soon fall off; generally covered with clusters of strong hairs or of prickles; the flowers springing from among the clusters of prickles, or from the margin or summit of the articulations, solitary, or corymbose-paniculate, generally yellow, rarely white or red; the fruit resembling a fig or pear, with clusters of prickles on the skin, mucilaginous, generally edible—that of some species pleasant, that of others poisonous. The prickles are so strong, and their stems grow up in such number and strength, that they are used for hedges in warm countries. The Common Prickly Pear or Indian Fig (O. vulgaris), a native of Virginia and more southern parts of North America, is now naturalised in many countries of Europe and north of Africa, and in other warm countries. It grows well on the barest rocks, and spreads over expanses of volcanic sand and ashes too arid for almost any other plant. It is of humble growth; its fruit oval, rather larger than a hen's egg, white, or yellow and red, the pulp red or purple, juicy, and pleasantly combining sweetness with acidity. It is extensively used in many countries as an article of food. In the south of England the prickly pear lives
in the open air, and occasionally ripens its fruit. In species it is cultivated considerably to the north of its native region. Lime publish is often mixed with the soil in which it is to be planted. The fruit is imported into Britain, to a small extent, from the Mediterranean. The Dwarf Prickly Pear (O. nana), very similar, but smaller, and more prostrate in stem, is naturalised in Europe as far north as the sunny slopes of the Tyrol. The Tuna (O. tuna), much used in some parts of the West Indies as a hedge-plant, and also valuable as one of the species which afford food to the cochineal insect, yields a pleasant fruit. It has red flowers, with light stamens, which display a remarkable irritability.

Pride, Thomas, one of the most resolute of Cromwell's soldiers, was a native of London, and of humble origin. At first a drayman and brewer, he enlisted at the commencement of the Civil War, and by his merit quickly rose to be colonel. He commanded a brigade under Cromwell in Scotland, and, when the House of Commons betrayed a disposition to effect a settlement with the king, was appointed by the army to purge it of its Presbyterian royalist members. By 'Pride's Purge' about a hundred were excluded, whereupon the House was reduced to about eighty members, proceeded to bring the king to justice. Colonel Pride sat among his judges, and signed the death-warrant. He died 23 Oct. 1658, and so felt the rage of his enemies when his body was dug up and hanged beside Cromwell's on Tyburn.

Prideaux, Humphrey, scholar and divine, was born of an ancient and honourable family at Padrów, Cornwall, 21 May 1648. He was educated at Westminster School under Dr Busby, and then at Christ Church, Oxford, where he graduated B.A. in 1672. His Marmora Oceanitae (1676), an account of the Arundel Marbles, procured for him the friendship of Lord Chancellor Finch (afterwards Earl of Nottingham), who in 1679 appointed him rector of St Clement's, Oxford, and in 1681 a prebendary of Norwich. After several minor preferments he was collated in 1688 to the archdeaconry of Snifolk, and in 1702 was made Dean of Norwich. He died 1st November 1724. His nine works in Church history (1697-1724) were very popular. Directions to Churchwardens (1701; 15th ed. 1856); and The Connection of the History of the Old and New Testament (1713-17; 27th ed. 1876). The last treats with much learning, but less discernment, of the affairs of ancient Egypt, Assyria, Persia, Judæa, Greece, Rome, and Greece, so far as they bear on the subject of sacred prophecy. See Prideaux's Letters to John Ellis, edited by E. M. Thompson (Camden Soc. 1875).

Pride of China (also called Pride of India and Bead-tree), a handsome tree of the order Meliaceae (M. azedarach), a native of India, naturalised in the southern states of the American Union. It grows rapidly, has large bunches of flowers, and enormous quantities of small fruit. A decoction of the bark of its root is used as a vermifuge.

Prie-dieu (Fr., 'pray God'), a portable kneel-desk; a chair which may be used for kneeling in prayer.

Priego, a town of Spain, 46 miles SE. of Cordova, grows wine and weaves silk. Pop. 1578.

Prieure, anciently one of the 'twelve' cities of Ionia, stood a little NW. of the mouth of the Maeander in Caria. Here in the second half of the 19th century the remains of an elegant Ionic temple to Athene Polias were examined by an agent of the British Society of Dilettanti, who carried off and gave to the British Museum the stone bearing the inscription that recorded its dedication by Alexander the Great. See Antiquities of Ionia, part iv. (1882).

Priessnitz. See Hydropathy.

Priest (Gr. presbyteros, Lat. presbyter, Fr. prêtre), the title, in its most general signification, of a minister of public worship, but specially applied to the minister of sacritery or other mediatorial offices. In the early history of mankind the functions of the priest seem to have commonly been divided among the heads of each family, but on the expansion of the family into the state the office of priest became a public one. It thus came to pass that in many instances the priestly office was associated with that of the sovereign. But in many religious and political bodies, also, the orders were maintained in complete independence, and the priests formed a distinct and, generally speaking, a privileged class. The priestly order, in most of the ancient religions, included a graduated hierarchy; and to the chief, whatever was his title, were assigned the most subordinate of the religious offices which were connected with the body. In Egypt, the population is supposed to have been divided into three or four castes, at the head of which was the sacerdotal, or priests. This division, however, was not very strictly observed, as the son did not invariably follow the profession of the father. Thus the priest and his proper descendants and the principal classes of priests were in existence at the earliest periods—the hont, or prophets, and the ab, or inferior priests. The first were attached to the worship of all the deities of Egypt; and in the greater cities they there was hont, high, prophét, or priest, was头顶ed over the others; at Thebes there were as many as four prophets of Ammon. Their duties appear to have comprised the general cultus of the deity. They also interpreted the oracles of the temples. Besides the priests of the gods, others were attached to the worship of the king, and to various offices connected with the administration of the temples. The class of priests called ab, or 'pure,' were inferior, and were also attached to the principal deities and to the personal worship of the monarch. They were required to be scrupulously pure, and accustomed on their diet, bathing and fasting frequently. The priesthood of India belongs to the first caste, or that of the Brahman, exclusively (see CASTE, INDIA). But, as the proper performance of such functions requires, even in a Brahman, the knowledge of sacred texts to be recited at a sacrifice, and of the complicated ceremonial of which the sacrificial acts consist, none but a Brahman learned in one or more Vedas, and versed in the works treating of the ritual, possessors, according to the ancient law, the qualification of a priest. See also BUDDHISM, LAMAIISM.

In sacred history the patriarchal period furnishes an example of the family priesthood; while in Melchizedeca, king of Salem, we find the union of the royal with the priestly character. In the Mosaic law the whole theory of the priesthood, as a sacrificial and mediatorial office, is fully developed. The priest of the Mosaic law stands in the position of a mediator between God and the people; and, even if the sacrificer which he offered be regarded as but typical and prospective in their moral efficacy, the priest must be considered as administering them within the special, and not the moral value. The Mosaic priesthood was the inheritance of the family of Aaron, of the tribe of Levi (q.v.). It consisted of a High-priest (q.v.), and of inferior ministers, distributed into twenty-four classes. The age for admission to the priesthood is nowhere expressly fixed; but, from
2 Chronicles, xxxi. 17, it would seem that the minimum age was twenty. In the service of the temple the priests were divided into twenty-four classes, each of which was subject to a chief priest, and served, each company for a week, following each other. Their duties in the temple consisted in preparing, slaying, and offering victims, in preparing the show-bread, burning the incense, and tending the lights of the sanctuary. Outside they were employed in instructing the people, attending to the daily offerings, enforcing the laws, and the like. All of their maintenance were set aside certain offerings (see First-fruits) and other gifts. They wore a distinguishing dress, the chief characteristics of which were a white tunic, an embroidered cincture, and a turban-shaped head-dress. The Jewish priesthood may be said to have practically ceased with the destruction of the temple.

In the Christian dispensation the name primi-
vitely given to the public ministers of religion was presbyteros, of which the English name 'priest,' is borrowed from the Latin. Like its Greek original, it meant originally a ruler or presider. The name given in classical Greek to the sacrificing priests of the pagan religion, Gr. hierarros, Lat. sacrest, is not found in the New Testament explicitly applied to ministers of the Christian ministry; but very early in ecclesiastical use it came to be employed to designate those who, with all those bodies of Christians—Roman Catho-
liques, Greeks, Syrians, and other Orientals—who regard the eucharist as a sacrifice (see Liturgy) the two names were applied indiscriminately. The priesthood of the Christian church is one of the grades of the hierarchy, second in order only to that of bishop, with which order the priesthood has many functions in common. The priest is regarded as the ordinary minister of the eucharist, whether as a sacrament or as a sacrifice; of bap-
tism, penance, and extreme unction; and although the contracting parties are held in the modern schools to be themselves the ministers of marriage, the priest is regarded by all schools of Roman divines as at least the normal and official witness of its celebration. The priest is also officially charged with the instruction of the laity in all direction of their spiritual concerns, and by long-
established use special districts, called parishes, are assigned to priests, within which they are entrusted with the care and supervision of the spiritual wants of all the inhabitants. The holy ordel of priesthood can only be conferred by a bishop, and he is ordinarily assisted by two or more priests, who, in common with the bishop, impose hands on the candidate. The rest of the ceremonial of ordination consists in investing the candidate with the sacred instruments and erna-
mants of his order, anointing his hands, and reciting certain prayers significant of the gifts and the duties of the office. The distinguishing vestment of the celebrant priest in the mass is the Chasuble (q.v.). In Catholic countries priests wear ever in public a distinctive dress in most respects common to them with the other orders of Clergy (q.v.). In the Latin Church priests are bound to a life of celibacy. In the Greek and oriental churches married men may be advanced to the priesthood; but no one is permitted to marry after ordination. Priests are not permitted to marry a second time, should his wife die.

In the Church of England, and other Reformed Episcopal Churches, the term priest is retained as the designation of the second order of clergy, whose special office it is (1) to preach, (2) to pronounce the forms of Absolution in the Morning and Evening Prayer, in the Communion Service, and in the Office for the Visitation of the Sick; and (3) to preach, though this last office is, by special license, sometimes extended to deacons. See Deacon, Orders (Holy).

Priestley, Joseph, son of a cloth-dresser, was born at Fieldhead, near Leeds, 13th March 1733. For some time he was obliged to abandon school studies, owing to weak health, and betook himself to mercantile pursuits, but with great success. His literary studies were resumed at a dissenting academy at Daventry (founded by Dr Doddridge). Though his father and family were strong Calvinists, young Priestley, during his residence at the academy, fell in with Dr Whitefield and became imbued with the theological and metaphysical opinions of his youth. 'I came,' he says, 'to embrace what is called the heterodox side of every question.' In 1755 he became minister to a small congregation at Needham Market, in Suffolk. While here he composed his work against the doctrine of Christ's death being a sacrifice or satisfaction for sin, entitled The Scripture Doctrine of Remission. In this he taught that the Bible is indeed a divine revelation, made from God to man through Christ, himself a man and no more, nor claiming to be more, and that the doctrine of the sacrifice and the Atonement. In 1758 he quitted Needham for Nantwich; and in 1761 he removed, as teacher of languages and belles-lettres, to an academy at Warrington; and here his literary career may be said fairly to have begun. A visit to Ireland furthered the object of Franklin, who supplied him with books which enabled him to write his History and Present State of Electricity, published in 1767. It was followed by a work on Vision, Light, and Colours. In 1763 he published his Theory of Languages and Universal Grammar. In 1764 he was made LL.D. of Edinburgh, and F.R.S. in 1766. In the following year he removed to Leeds, having been appointed minister of the Mill Hill dissenting chapel there. A brewery beside his dwelling gave a new direction to his energetic and versatile mind; he began to study chemistry. In 1773 he was appointed literary companion to Lord Shelburne, and accompanied the earl on a continental tour in 1774. Having been told by certain Parisian savants that he was the only man of understanding with whom they had ever known who believed in Christianity, he wrote, in reply, the Letters to a Philosophical Unbeliever, and various other works, containing criticisms on the doctrines of Hume and others. But, while laughed at in Paris as a believer, at home he was branded as an advocate of the opinions of two heaths, and the latter imputation, he published, in 1777, his Disquisition Relating to Matter and Spirit, in which, partly materialising spirit and partly spiritualizing matter, he holds that our hopes of resurrection must rest solely on the truth of the Christian revelation, and that on science they have no foundation whatever. On leaving Lord Shel-
burne, he became minister of a dissenting chapel at Birmingham. The publication, in 1786, of His-

ory of Early Opinions concerning Jesus Christ occasioned the renewal of a controversy, which had long before begun, between him and Dr Horsley, concerning the doctrines of Free-will, Materialism, and Unitarianism. His reply to Burke's Reflections on the French Revolution led to his being made a citizen of the French Republic; and this led to a bomb on one occasion breaking into his house and destroying all its contents, books, manuscripts, scientific instruments, &c. A brother-in-law, how-
ever, about this time left him £10,000, with an annuity of £200. In 1791 he was elected to a charge at Leeds, but the innovations his sympathies had made him unpopular, and he (1794) removed to America, where he was heartily received. He died at Northumberland, Penn-
sylvania, 6th February 1804, expressing (though
he agreed that he should be called a materialist) his confidence in immortality. As a man of imprerachable character, serious of temper, fearless in searching after and confessing the truth, his services to chemistry are summed up at Vol. III. p. 147 (and see OXYGEN); recent research fully justifies Priestley's title to be called the father of pneumatic chemistry. Thorpe, at the British Association, 1830 (see Nature, xlii. 449), not merely defended the priority of his discovery of oxygen (1774) and of the composition of water (1781), but denied Lavoisier's claim to be considered an independent discoverer. See J. T. Rutt's edition of Priestley's Works (2 vol., 1852), and the Autobiographical Memoir; and Martinian's Essays, Reviews, and Addresses (vol. i. 1891).

**Priest's Holes.** See SECRET CHAMBERS.

**Prim.** Juan, Spanish general, was born at Reus, 6th December 1314, and rapidly rose to be a colonel, and so distinguished himself in war and statesmanship as to be made general, marshal, and marquis. As progressist he opposed Esparrtero. Failing in an insurrectionary attempt in 1806, he had to flee to England and Brussels, but here he guided the movement that in 1808 overthrew Isabella. He was war minister under Serrano, but soon became virtually dictator. He secured the election of an Italian prince, Amadeo, as king (in order, as was thought, that the king might be under the minister's control), and was thereupon shot by an assassin as he left the Cortes, 25th December 1870. He died on the 30th.

**Primaria Dona (Ital.),** the first female singer in an opera.

**Primage,** a charge (over and above the freight) paid by the shipper or consignor of goods for loading the same, to the master and sailors of a ship, or to the owner or freighter.

**Primary Colours.** See COLOUR.

**Primary Rocks.** See PALEOZOIC.

**Prime (Lat., primus),** anciently a bishop holding a position of pre-eminence. Thus the bishop of Rome was called primas of the whole church. In modern times the title belongs only to such sees as had formerly the dignity of vicar of the holy see annexed—Armagh, Arles and Lyons, Mainz, Toledo, Pisa and Salerno, &c. But none of these possess any special primatial jurisprudence. For the primate in the Church of England, see the article ARCHBISHOP. The name *primus* is applied in the Scottish Episcopal Church to the presiding bishop. He is chosen by the bishops out of their own number, without their being bound to give effect to seniority of consecration or preeminence of dioceses.

**Primates,** the name given by Linnaus in his system to the first order of Mammals (q.v.), which he placed first (whence the name, Lat. *primus*, 'first') because he ranked man amongst them.

**Prime,** the first of the 'lesser hours' of the Roman breviary. See BREVIARY.

**Prime minister.** See TREASURY, CABINET.

**Primero,** or **Prime,** a game at cards popular in England in the 16th century, but now obsolete. The same or a very similar game was played in Italy under the name primiero, and in France under the names *prime, ambusq,* &c. Primero belonged to the family of games of which the old pet and pair and the more modern brag and poker are members.

**Primitive Methodists.** See METHODISTS.

**Primogeniture** is the rule of law under which the eldest son of the family succeeds to the father's real estate in preference to, and in absolute exclusion of, the younger sons and all the sisters. See ENTAIL, FAMILY, FEUDALISM, FIRST-BORN, LAND LAWS, SUCCESSION; and the valuable monograph on *Primogeniture* (1895) by Evelyn Cecil.

**Primordial Zone,** a name applied by Barrande to the group of strata which in Bohemia underlies the Silurian rocks, and is therefore on the horizon of the Cambrian system.

**Primrose** (*Primula*), a genus of plants of the natural order Primulaceae, having a bell-shaped or tubular five-toothed calyx, a salver-shaped corolla with five segments, five stamens, a globose germen containing many ovules, and a many-seeded capsule opening by five valves, and generally with ten teeth at the apex. The dimorphism of the stamens and pistil of primrose, illustrated in the accompanying figure, is not uncommon in other species of the genus, and has given rise to the terms *thrum-eyed* (A) and *pin-eyed* (B) in the language of florists in describing varieties of the Auricula and Polyanthus. The distinction is of some practical importance in so far as fertilisation of the individual flowers is affected by the relative positions of the respective organs. The species are all herbaceous perennials, generally having only radical leaves; and the flowers in a simple umbel, more rarely with scapes bearing solitary flowers. Almost all of them are natives of Europe and the north of Asia. Some of them are among the finest ornaments of our groves and meadows; some are found in mountainous regions. Their fine colours and soft delicate beauty have led to the cultivation of some of

PRIMROSE LEAGUE

Prince Edward Island

PRINCE EDDIE ISLAND

species in spring. The Common Primrose (P. vulgaris), abundant in woods, hedgerows, and pastures in Britain and in most parts of Europe, has obviate-oblong, wrinkled leaves, and single-flowered scapes; the flowers about an inch broad, yellowish white. This is the plant to which the English name radish, the German farina (see), the Akim of Egypt, and with it the Cowslip (q.v.), or Pägle (P. veris), and perhaps still more nearly related is the Oxlip (P. elatior), apparently wild in some parts of England, particularly in the eastern counties, but supposed by some botanists to be intermediate between the common primrose and the cowslip, which they therefore regard as extreme forms of one species. The Polyanthus (q.v.) is a cultivated variety of the cowslip. The Auricula (q.v.; P. auricula), an Alpine species, is a favourite garden flower. The Bird's-eye Primrose (P. farinosa) and the Scottish Primrose (P. scoticana) are both flowers of exquisite beauty, found in the northern parts of Britain, the latter chiefly on the coasts of Sutherland, Caithness, and the Orkney Islands. The Alps and the Himalaya Mountains produce several species. The Chinese Primrose (P. sinensis) had for more than fifty years been very common in Britain, not only as a greenhouse but as a window plant. It produces compound umbels of very numerous lilac, red, or white flowers, which are displayed in autumn, winter, and spring. Two varieties occur in the eastern省份 of the American Union—the Bird's-eye Primrose (P. farinosa) and P. miutuscinica, both rare—and several varieties in the western states, the most conspicuous being P. perryi, with large purple flowers, which grows on the Rocky Mountains.

Primrose League. This political organisation was founded November 17, 1853, by Lord Randolph Churchill, Sir John Coston, Sir Alfred Salte, and Sir H. Drummond Wolff. The name was chosen in reference to the fact that the primrose was Lord Beaconsfield's favourite flower (a fact by some unkindly disputed; cf. Notes and Queries for 1888, pp. 149, 416); and the fivefold petal of that flower is taken to indicate the five principal divisions of the British empire in Europe, Asia, Africa, America, and Australia. This strictly Conservative society, by the moderation and even liberality of its professions, by its enlistment and organisation of women, by its distribution of titles and badges with its emblem, which is dear to all and accessible to all, has attained an enormous growth and great political influence. It was originally intended to admit men only, banded in companies of about 100 to act as missionaries of the league; and the effect of admitting women may be gathered from the fact that the number of members rose from 957 in 1884 to 237,293 in 1886. The numbers as given by the society in 1891 were: habitations, 2126, and knights, dames, and associates enrolled as members, 963,943. The founder of the association of the League was the Marquis of Salisbury, K.G. The head office is at 64 Victoria Street, Westminster. In July 1890 the first branch in Canada was established in Winnipeg. See an article by Sir A. Borthwick in the Nineteenth Century for July 1886.

Primulaceae, a natural order of exogenous plants, containing more than 200 known species, mostly natives of temperate and cold regions. They are all herbaceous, or scarcely half-shrubby, with leaves generally all radical, and no stipules. The calyx is generally five-cleft, inferior or half-superior, regular, persistent; the corolla, with the limb divided into as many segments as the calyx, rarely wanting; the stamina inserted on the corolla, one opposite to each of its lobes; the ovary one-celled, the style solitary, the stigma capitulate; the capsule with a central placenta and many seeds. Many of the Primulaceae have flowers of much beauty, and some are very fragrant, as the Primrose, Cowslip, Auricula, Pimpernel, &c.

Primula Mobile. See Ptolemy.

Prince (Lat. princeps), an epithet which was originally applied to the princeps senatus of the Roman state, and afterwards became a title of dignity. It was adopted by Augustus and his successors; hence the word was afterwards applied to persons enjoying kingly power, more especially the rulers of small states, either sovereign or dependent. The title is now very generally applied to the sons of kings and emperors and persons of the blood royal, sometimes with a territorial title (Prince of Wales, Prince of Orange), or with an addition, 'crown prince,' 'prince imperial,' &c. In various parts of continental Europe the title prince is borne by families of eminent rank but not possessed of sovereignty. Practically in Britain the term prince is restricted to members of the royal family (see PRECEDENCE). The eldest son of the reigning sovereign is by a special patent created Prince of Wales (see WALES, PRINCE OF). In France, under the old regime, dukes took precedence of princes; and many dukes had prince-doms as minor titles. Napoleon put his new-created princes above dukes. In Italy princes rank after dukes, sons of dukes being called princes. In Germany the ambiguity of applying the same title to the members of royal houses and princely families of the reigning line, the former being styled 'Prince,' the latter 'Prince of,' The German Fürst takes rank below the Duke (Herzog). Most of the counts who had a seat in the old German Diet were elevated to the dignity of Prince on their acquiescence in the dismemberment of the German empire (see Germany, Vol. V. p. 177). In a more general acceptance the term prince is often used for a sovereign or the ruler of a state.

Prince Edward Island is a province of the Dominion of Canada, having entered the confederation in 1873. It is situated in the Gulf of St Lawrence, and is separated from New Brunswick and Nova Scotia by Northumberland Strait. The greatest length of the island is 130 miles; its breadth varies from 4 to 34 miles, and it has an

Flowers of a few of the Primulaceae: a, Primula alkiniana; b, P. obconica; c, P. sieboldii; d, common primrose (P. vulgaris); e, cowslip (P. veris).
area of 2133 sq., i.e. about 1,563,400 acres, nearly all of which are occupied. Population in 1891 numbered 109,088, or 51 persons to the square mile. At 1763, when the first post was planted, the claim was made to it by the British on that account. Possession was assumed by the French, but little was done towards its settlement until 1715, when its fertility attracted some Acadians from Cape Breton. It was finally ceded to Great Britain in 1763. In the first part of it formed part of Nova Scotia, but in 1768 was made a separate province. The pop. in 1763 was 4000; but about that time an emigration set in to the mainland, and the Acadians were expelled, so that in 1768 it had been reduced to about 1300 (see ACADIA). Until 1799 it was called St John's Island, but its name was then changed to Prince Edward Island, in compliment to the Duke of Kent, who paid a visit in that year. Prior to 1875 most of the land was the property of absentee proprietors, and for many years the land question was a source of difficulty. The local government, however, passed a measure in 1875 giving them powers to buy out the landlords, and to sell the land to the tenants or others on easy terms of repayment. Out of the 843,981 acres acquired by the government in that way, all but 97,102 acres have been paid up to become freeholds. Although the arrears are being met in a satisfactory manner, the arrears being very trifling. By this legislation a fruitful source of irritation was removed, and the agricultural industry—the principal one in the province—placed on a more satisfactory footing.

Situated off the south coast of the mainland, the appearance of the island is exceedingly prepossessing. The surface is undulating, but never exceeds 500 feet; the soil is very fertile, consisting generally of a light reddish loam, and occasionally of a stiffer clay, resting in some places on red sandstone, although in other localities it seems to be entirely alluvial. All kinds of cereals, roots, and vegetables are raised. Oats and potatoes from the island enjoy a special reputation, and the same thing may be said of its sheep and horses. A natural manure, called mussels mud, and made of decayed oyster, clam, and mussel shells, is found on the coast of the island, and is used by the farmers, and is said to be a most valuable fertiliser. Although coal is known to exist, it is not worked, owing to the depth at which it is found and the cheapness at which it can be purchased from Nova Scotia. There are apparently no other mineral resources of the island, except the climate, healthy, being milder than that of the mainland, and freer from fogs. Winter is long and tedious, but the summer months are pleasant and enjoyable. Prince Edward Island is without doubt the best fishing station in the Gulf of St Lawrence, but the habits and feelings of the inhabitants are so decidedly agricultural that the fisheries have not received from them the attention they deserve. They consist chiefly of mackerel, lobsters, herring, cod, hake, and oysters; while salmon, bass, shad, halibut, and trout caught in limited quantities. In the year 1889 the value of the fisheries was $886,430; the catch included 13,450 barrels of mackerel, 33,940 barrels of herring, 21,196 cwt. of cod, 90,000 lb. of haddock, 748 cwt. of hake, 3730 lb. of halibut, 50,920 lb. of trout, 3646 barrels of cod, 13,140 barrels of hake, 4116 barrels of oysters, 2,069,947 lb. of lobsters, 13,647 lb. of cod and hake sounds, and 13,832 gallons of fish oils. The present annual value of the oyster fishery exceeds $120,000; and this industry is capable of vast development. Lobsters in 1889 were exported to the extent of 818,200 lb., of the value of $102,883.

The coast-line is a succession of bays and projecting headlands; the largest bays are Egmont, Hillsborough, and Cardigan, which by penetrating into the land from opposite directions form narrow inlets, dividing the island into three distinct districts. Charlottetown, the capital, and has a pop. of 13,000. Other principal towns are Summerside (3000), Georgetown, and Souris. The rivers are naturally short, but the province is well watered. Manufactures are not carried on to any large extent, and chiefly for local purposes. Shipbuilding was an important industry previous to the substitution of iron and steel for wooden vessels.

The exports for 1890 were valued at $875,964, divided as follows: Produce of the mine, $20; forest, $7575; fisheries, $187,743; agriculture, $864,688; manufactures, $122,388; paper and other wares, $19.3117. Imports were valued at $981,177. There is a railway, built and worked by the Dominion government, running from one end of the island to the other. The island is connected by telegraph with the mainland, and there is daily steam communication between the two, although it is occasionally interrupted during the winter. In 1891 the people were urging the construction of a tunnel under the Northumberland Strait, for the purpose of establishing communication with the mainland all the year round. The Dominion government is now discussing the question of the cost to be prepared. The tunnel would be some 7 miles long. According to the census of 1891, the settlers were largely of English, Irish, and Scotch descent, and French, Germans, and Scandinavians. The principal religious denominations were: Roman Catholiques, 47,857; Presbyterians, 33,072; Methodists, 13,596; Church of England, 6646. The Bishop of Nova Scotia exercises episcopal authority over the island, and the Roman Catholiques have one diocese, that of Charlottetown. Free education has prevailed since 1853. In 1889 the district schools numbered about 436. There are also grammar schools, private schools, a normal and a model school, and two colleges—the Prince of Wales (Protestant) and St Dunstan's (Roman Catholic). The government of the island is administered by a lieutenant-governor, appointed by the governor-general in council, and largely by the legislative council consists of thirteen members, and the assembly of thirty members, the latter being elected for four years. In the Dominion senate the province is represented by four members, and in the House of Commons by six.

Princeites, a name given to the Agapemone (q.v.) from the founder.

Prince of Wales. See WALES (PRINCE OF). Prince of Wales Island. See PENANG.

Prince Rupert's Drops. See ANNEALING.

Princes Islands (anc. Demanessow), a beautiful group of nine islets near the eastern end of the Sea of Marmora, about 10 miles SE. of Constantineople. They are the largest islets of Prince Islands. They are a favourite summer-resort of the Constantinople Greeks, and in old times were frequently a place of exile for those in disfavour at the Byzantine court. See Schilmerger, Les Îles des Princes (1884); S. S. Cox, The Isles of the Princes (New York, 1888).

Prince's Metal, a name, derived from Prince Rupert, given to an alloy of copper and zinc, in which the proportion of zinc is greater than in brass.

Princeton, (1) capital of Gibson county, Indiana, 161 miles by rail E. of St Louis. It has manufactories of woollens, flour, &c., and is in an agricultural region. Pop. (1900) 1641.—(2) A borough of New Jersey, 50 miles by rail SW. of New York. Pop. (1900) 3899. On January 3, 1777, it
was the scene of a battle between the British under Colonel Mawhood and the Americans under Washington, in which the former were defeated; here the Continental Congress sat, and from Princeton, Washington dined his farewell address to the army. Princeton, however, is chiefly cele-

brated as the seat of the College of New Jersey, popularly known as Princeton College, which, founded by charter in 1746, under the auspices of the President of New York, and its first university

mencement under its second charter at Newark in 1748. Liberal subscriptions were obtained both in America and in Britain, the Bishop of Durham being among the contributors, and the General Assembly of the Church of Scotland ordering a national collection. In 1766 the college was transferred to Princeton, on the erection of a hall named Nassau Hall in honour of William III. Within it hung a portrait of Washington. The College of New Jersey has had several distin-
guished Presbyterian divines for its presidents, as Jonathan Edwards and Dr James M'Cosh. Since the civil war benefactions have poured into the college; during the twenty years of Dr M'Cosh's presidency these exceeded $3,000,000. Post-graduate courses have been introduced, and the staff of instructors raised to thirty-three; the number of students is about 1100. Since its foundation, three of its graduates have been James Madison, fourth president of the United States, and many very eminent men. The college possesses a school of science and museums, laboratories, observatories, and libraries with 180,000 volumes. In 1896 it was transformed into Princeton University. The theological seminary, founded in 1812, is the oldest and largest (nearly 290 students) of the Presbyterian Church in Amer-

icas. It was the seat of the American Biblical Association in 1895. Princeton Quarterly ("new school"), which was succeeded by the American Presbyterian Review. See (anon.) Four American Universities: Harvard, Yale, Princeton, and Columbia (1895).

Principal. See Agent and Surety; also Accessory.

Pringle, Thomas, minor poet, was born at Blairclay (near Kelso), Roxburghshire, 6th January 1793. Lamc from childhood, dyspeptic, devout, he went at seventeen to Edinburgh University, and found beyond the bounds of its clergymen the Scottish Public Records Office. He took to writing at an early age, and, besides other literary schemes and ventures, started the Edinburgh Monthly Magazine, the parent of Blackwood, in which his own most important article was on the Gypsies, from notes supplied by Scott. In 1820 he set sail with a party of twenty-four emigrants of his father's family for Cape Colony. He travelled into the interior with the party, and had his heart stirred within him to see the inhumanity practised in the country among the Dutch and D'Kaiti residents alike. For three years he lived at Capetown as librarian of the government library at a salary of £75 a year. He started the South African Journal, and fought a brave fight for the freedom of the press. But he was bullied by the military and petty-minded governor of the day, Lord Charles Somerset, his schemes crushed, and himself reduced to poverty. He returned to London in 1826, and became secretary of the Anti-

Slavery Society. He died in London, 5th December 1834. His Ephe meris (1828) was a collection of graceful verse. The poems that related to the

African— the best "Afar in the Desert"— were reprinted in the volume of African Sketches (1834), a series of glowing sketches of South African scenery. Pringle's Poetical Works were edited, with a florid eulogium, rather than a life, by Leitch Ritchie (1839).

Printing is the art of taking, by pressure, prints or copies in reverse of an original design of a suitable character, reduplicated with pigment or ink. The word has a very wide application, and is used, for instance, in connection with such different processes as photographic 'printing,' in which no pressure is required, and callco-printing. A definition based upon the comparatively small and simple character of the category of 'prints' such operations as moulding, stamping, and embossing. The word has, however, acquired conventional limitations of meaning, and is now applied usually to the three methods of copperplate printing (see Engraving), Lithography (q.v.), and letterpress printing. The first two being already described, the present article will be confined to a description of the latter.

There is no doubt the Chinese practised printing in some senses of the word many centuries before it was known in Europe, as has been noticed at China, Vol. III. p. 196. The method commonly used down to the present time is one originally adopted by Foong T'ou in the 10th century. A piece of pear-tree wood is cut up into boards of about half an inch thick, and these into blocks large enough to hold the design. The blocks are planed, squared, and sized or var-

ished. The design to be engraved is drawn or written on thin transparent paper, and transferred to the surface of the block by rubbing. The engraver next cuts away the field, leaving the transferred letters in high relief. A block of this kind can be cut at about the same expense as it could be set up in movable metal types, and it needs no proof-reading or correction. For printing no press is used, the block being adjusted to a table, before which the wood stands, having a bowl of fluid ink on one side and a pile of paper on the other. In his right hand he has two flat-

faced brushes, fixed on the opposite ends of the same handle. One brush is dipped into the ink and swept over the face of the block, on which a sheet of paper is now placed; the other, which is then swept lightly but firmly with the dry brush at the other end of the handle, is used to moisten the paper— which is soft, thin, pliable, and a quick absorbent of fluid ink. Printing from movable types was, according to Klaproth, an invention of the Chinese, as early as the 12th or 13th century, as there are Coreen books printed from movable clay or wooden types in 1317. But the Chinese still prefer block-

printing; and printing from metal types in China is mainly practiced for circulating the Bible and for newspapers, according to materials invented by Europeans. About 6000 Chinese characters suffice for a missionary printing-office; but for magazine work about 10,000 are necessary. For the baseless tradition that Marco Polo brought the knowledge of block-printing to Europe, see Pola.

The art of printing by the use of movable types was invented in Europe about the middle of the 15th century; but no more definite statement concerning its origin can be made with confidence. The name of the country in which the invention was first typographically practised in the year of the invention are, up to the present time, matters of dispute. Modern researches have completely disposed of as a mere legend the wide-

spread belief that the invention of movable metal types, cast in a mould from a matrix formed by the letters printed once or more and used to print the same book, was the outcome of the use of wooden types, which it was formerly thought formed the link between the block-books common in the early part of the 15th century (see Wood-engraving)
and the earliest letterpress prints. Equally baseless is the belief that the first metal types were cut instead of being cast. The evidence on these two points is too minute and technical to be adduced here.

The controversy as to the invention of printing has lasted nearly four centuries, and it has unhappily been carried on with a vehemence and bitterness which perhaps no other controversy, not a religious one, has ever excited. Up to 1499 it was universally believed that typography was invented in 1440 by Johannes Gutenberg, the father of printing, and this belief was accepted without question. But it has since been proved that printing was invented in Holland in the early part of the sixteenth century, and that the art was discovered first of all in Germany, at Mainz on the Rhine; that it took place about 1440, but that, although it was discovered at Mainz, the first "prefiguration" was in Holland, in the form of the Donatianes which were printed before that time; that the claim of the Dutch printers to discovery was undoubtedly substantiated; that printing was communicated to the chronicler by Ulric Zell, a contemporary printer at Cologne. These statements may be attributed the commencement of the controversy ever since carried on. In 1588 Adrien de Jonghe ("Haidrnan Junius"), in his Batenia, printed by the Plantin office at Antwerp, gave the first circumstantial account of the alleged Dutch invention, which, he said, he had heard from old and trustworthy people. This, it was, he noticed, about a century and a half after the invention. Junius stated that in 1408 "Louvyn Janszoon," surnamed Coster (q.v.), lived at Haarlem; that he one day took a walk in the Hoof, and cut letters on the bark of a beech-tree; that he printed these letters on paper for the amusement of children; that he invented a suitable printing-ink, and afterwards began to print single sheets, which he printed from the wooden letters, or letters and tiles, of which he had made a complete set. Among his workmen was one Johannes—the surname was not given by Junius—who in 1441 stole the types and fled to Mainz, where he opened a workshop, and in 1442 published, with Coster's type, the Psalter of Lessius, and the Truths of P. Hispomanus. From this date, as already stated, the question whether printing was "invented" in Holland or in Germany has been fiercely debated, and scores of books have been written upon it. The titles of these are given in Bigmore and Wyman's Bibliography of Printing (3 vols. Lond. 1880-86). The controversy was renewed with much vigour, and unfortunately with much acrimony, in 1870; and it has since been maintained, the balance of evidence, or rather of probability—for of evidence there is an extraordinary lack—has fluctuated from one side to the other. In 1870 the "Costerians" included nearly all the leading bibliographers and typographical historians. An eminent Dutch investigator, Dr. van der Linde, published a series of articles, since translated into English (Lond. 1873) called History of the English Type-Casters from 1440 to 1715. The purport of the book was that the documents brought forward to support the claims of Coster were false, and that the arguments in his favour were devoid of any historical or bibliographical support. Van der Linde showed further that several of the documents on which the Costerians relied were actually frauds and forgeries. This exposure for a time completely routed the supporters of the Dutch claims. In 1878 the same author produced a companion volume, Gutenberg—Geschichte und Entdeckung aus den Quellen nachgewiesen, but there was little new in it. Mr. Hessels of Van Halen, a native of Mainz, who had spent several years in examining in Germany all the documents extant connected with the history of Gutenberg, and exposed a number of falsifications and forgeries which had passed current, space will not here suffice to recapitulate his discoveries; his book is indispensable to any one desiring an accurate knowledge of the subject. The result of his researches was more negative than positive. He said that he had not found anything which enabled him to answer in the affirmative or in the negative the question, Was Gutenberg the inventor of printing? Of the thousands of claims, which were relied upon by his supporters one is lost entirely, and the other two are only transcripts. Even if we accept these transcripts, he says, they point to Gutenberg only as a printer, and not as the inventor of printing. In 1888 Dr. van der Linde published from the General Archives of the Erfindung der Buchdruckerkunst. It was produced in magnificent style at the cost of the German government, but it added to our knowledge of the eminence nothing of importance. M. Hessels has since continued his investigations, and the result is indicated in the title of his book, issued in 1887, Haerlem the Birthplace of Printing, not Mainz. This important work virtually takes us back to 1499, when the Cologne Chronicle declared that the first idea of printing was found in Holland. The Costerians have now dropped and clumsy specimens of printing—some of which have been quite recently discovered—are generally allowed to be "Costerian." On the other hand, there is the magnificent Bible and Psalter undeniably printed by Gutenberg and his associates. It is difficult to believe that this work is inferior in any way to the Dutch claims. Possibly within some ancient bindings there exist at the present moment prints that would settle for all futurity the controversy which has raged for four centuries as to the "origines typographici." It has been mentioned at Gutenberg that after first and obtained possession by action at law of Gutenberg's office, and while he was carrying it on as a printing concern, Gutenberg, by the assistance of another capitalist, set up a second office. With two rival establishments in existence, it was impossible to keep secret the processes of printing. In 1402 the city of Mainz was sacked, and the catastrophic dissolved engagements between employers and employed, and caused many of the latter to migrate to other countries, taking with them, of course, their knowledge of the art. Printing spread with marvellous rapidity, considering the means employed.
PRINTING

Printing was brought to England in 1476 or 1477 by William Caxton (q.v.), who set up his office within the 'precincts' of Westminster Abbey—but not within the sacred building itself, as often erroneously stated. See William Blades's Biography and Typography of William Caxton (2d ed. Lond. 1882). The first hundred years of the history of printing in England was a period of great activity. In 1478 printing was done at Oxford by Theo. Rood; in 1490 at St Albans by an unidentified printer now called 'the Schoolmaster,' in the same year in the city of London by Lettou, and in St Cambridge by Sibberr. When the art had spread throughout the country, when education became more common, and men began to read about the questions and events of the day, it began to be seen by the authorities and rulers that a mighty power for good or evil had arisen in the land. Then it was deemed necessary to regulate the press. In 1530 censorship was established in England. It ushered in a period of lamentable decadence in the quality and quantity of the printing done. Printers were cruelly punished, especially during the existence of the unlicensed printers who were continually being abused, and often imprisoned, printers lost all enterprise and all social position. For many years there were no good printers at all. Censorship was abandoned in 1594. Then began a period of revival, greatly aided by the improvements in type-formatting and the use of the movable type, and the prevalence of the 'Bibulonia' towards its close. The 19th century has been one of marvels development, following the invention in 1814 of the steam printing-press.

It is believed that printing was introduced into Scotland in 1507. A patent has been discovered, of King James IV., which shows that a printing-press was established at Edinburgh during the year named. This patent was granted to two burgesses of the city of Edinburgh—Walter Chappie—m an in the law, and Nicol—Myllar, a bookseller who had learned in France the art of printing. The 'prent and expert men' to use the press came from France. The office was in the Southgate, now the Cowgate. As early as 1508 several small publications were issued. After these came the work for which the press was ostensibly established—the 'Aberdeen Breviary,' in two volumes, forming 1554 pages of small type. It was intended to become the standard Scottish service-book. Myllar was probably dead when it was completed, and with its publication Chappie's connection with typography came to an end. For many years subsequently all works of Scottish authors were printed in France. The next printer was Thomas Davidson, a practical man who in 1541 was chosen to print acts of the parliament of James V., which placed him in the position of king's printer. It is not necessary to catalogue the names or the works of his immediate successors. Up to 1600 the average workmanship of the Scottish printers was about as bad in quality as that of their later successors has been distinguished for its beauty, excellence, and accuracy. This is not the only noteworthy feature of early Scottish typography. The printers were astonishingly few in number; during 150 years after the introduction of the art there were only about a dozen master printers who were natives. During the first hundred years only twenty-five different works are known to have been printed in Scotland. See R. Dickson and J. P. Edmond, Annals of Scottish Printing from the Introduction of the Art to the Beginning of the 17th Century (4to, Cambridge, 1890)—a most exhaustive and trustworthy book.

The first printing-press set up in America was introduced by the vicerey of Mexico, Antonio de Mendoza, and the first book printed by it in the New World was Lo Resumen de la Vida de Nuestra Senora de Loreto (1536). The earliest press in the British-American colonies was brought over for Harvard College in 1638. The Bay Psalm Book (1640); see ELIOT, JOHN was its first important work; but in 1639 it printed the Freeman's Oath and an almanac. The first press in Philadelphia was set up in 1685, in New York in 1693. See I. Thomas, History of Printing in America (2d ed. Albany, 1874).

The practical art of letterpress printing consists essentially in coating certain relief surfaces with printing-ink, and then transferring that ink to the fabric, such as paper. The relief surface may be in a form of movable types or an engraved design cut in wood or metal, or a block east or electrotype from the type or the engraving; and the impressing is effected by the press or machine presently to be described.

Types are cut, cast, or otherwise formed from various materials, though the printer recognises only two kinds—wooden ones, which are cut to form the larger letters used in placards, and metal ones. All books and newspapers and the great bulk of books and pamphlets found in libraries are printed from metal types. A complete assortment of type of any one particular style is called a 'font,' and may vary in amount to any extent, according as it may be required in large or small quantities. The individual type is a piece of metal about 1 inch long with a letter, point, comma, or other similar printing device cut in relief on one end as shown in fig. 1. The notch shown on one side is to enable the compositor to place it right side up when 'setting' without the trouble of looking at the letter. The difference between 'foundry' types, a 'lower' and 'upper' case, the former holding the small letters (technically called 'lower case' letters in consequence), A Type, figures, commas and points, spaces to put between the words, 'quads,' &c. The upper case holds the capitals, small capitals, and the less often used sorts. The cases, wooden trays divided into 'boxes' by

![Upper Case](https://example.com/upper-case.png)

![Lower Case](https://example.com/lower-case.png)

thin slips of wood, are shown diagrammatically in fig. 2. The lower case is arranged not alphabetically, but so that the letters most used will be nearest the compositor's hand and have the largest...
Of sixteen after being printed. In making up the pages to the sheets, each form, as the classes containing the type are called, are required, one for each side of the sheet. If a printed sheet of sixteen pages be opened out, the pages will be seen to be arranged in the following order:

<table>
<thead>
<tr>
<th>Inside of Sheet</th>
<th>Outside of Sheet</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>2</td>
</tr>
<tr>
<td>d</td>
<td>14</td>
</tr>
<tr>
<td>g</td>
<td>1</td>
</tr>
<tr>
<td>j</td>
<td>11</td>
</tr>
<tr>
<td>m</td>
<td>7</td>
</tr>
</tbody>
</table>

And the pages in the chase must be so arranged, or "imposed" as it is called, that, when printed, they will so appear. When ready for printing or stereotyping, as the case may be, another proof is read for final correction. In some cases where great accuracy is required, such as in the present work, as many as six or eight proofs are "read" at different stages.

When the types have been printed or electrotyped and returned to the composing-room they are distributed by the compositors to the cases again for further use, and this can be done with wonderful rapidity, though great care must be used to avoid putting the letters into the wrong boxes. Several very ingenious machines have been invented for setting type (see TYPE-SETTING MACHINES) which have been more or less successful. They are worked something after the manner of type-writing machines (see TYPE-WRITER), but are too complicated to be described in detail within our limits. Several of the latest of these cast and set the type by one movement. Thus as the labour of re-distributing the types has been done with they are melted again. These machines are used for newspaper work.

In most printing-offices the men govern themselves by a voluntary association called a "chapel," which, although often (but not necessarily) connected with the printers' society, is independent so far as the individual affairs of the office are concerned. The office-bearers are called the "father" and "clerk" to the chapel, and it has elaborate sets of rules for regulating trade and personal affairs within the office.

Letter presses are coated with ink (see INK) by means of "composition rollers." These consist of cylinders of small diameter covered with composition made according to various recipes. Amongst them are glue, treacle, and Paris white; glue, sugar, and glycerine; glue, glycerine, sugar, and india-rubber, &c. These are melted, mixed together, and cast in cylindrical moulds of various diameters, according to the requirements of the machine or press. The glue and treacle composition was first used for printing by the engineers Donkin and Bacon in 1813; up to this time the types having been inked by pot-balls. The present system of inking the types was invented by Mr Edward Cowper in 1818. Leather and other substances were tried at first, and the machines in which they were used were discarded owing to the unsatisfactoriness of their rolling or inking arrangements. A good roller must be tenacious of ink, elastic, and retain its suction. It must not shrink, become hard in cold weather or soft in hot weather. The recipe for making it is varied according to the machine for which it is required—whether working on fine surfaces such as engravings, or at a high speed, as for newspaper work.

The earliest known representation of a printing-press is dated 1507, and it pictures an apparatus which is little more than a modification of the ancient wine-press. The essential feature is a flat
board, since known as a platen, which is movable vertically, and presses on a forme of type laid on an unresisting hard surface parallel to it. The two, between which was the paper, were brought together by a powerful screw, and thus the paper was squeezed down on the forme. This rudimentary appliance was improved from time to time, as is shown in various pictures of printing-office interiors. The wooden printing-press was brought to its ultimate degree of perfection in the later part of the 17th century. Moxon, the first technical writer on printing, described in 1683 what he called 'a newly invented press.' This was the old wooden press as improved by Blaeu of Amsterdam (fig. 9). This press continued to be generally used until the close of the 18th century. About 1800 Charles Mahon, third Earl Stanhope, was instrumental in producing a much improved printing apparatus.

![Old Common Press](image)

The press which bears his name was made entirely of iron, and the strength thus obtained enabled a forme to be printed on it double the size of that which could be done on a wooden press. There was a most ingenious system of links and levers, by means of which the approach to the type of the platen, and its withdrawal, were accelerated. The greatest leverage and consequently the greatest pressure were obtained when the forme and platen came into contact. These arrangements enabled the pressmen to print at the rate of 200 per hour on one side of the sheet or 100 per hour on both sides. After this several inventors turned their attention to the improvement of the hand-press. Clymer, an American, in his Columbian press, discarded the screw, the central feature of previous presses, and gained his power from a combination of powerful levers. About 1823 an excellent press, called the Albion, was brought out by Mr. R. W. Copeland of London, in which the pressure was gained by forcing an inclined bar of steel from a diagonal to a vertical position, forcing down the platen, the impression taking place when the piece of steel was brought into the vertical position. The Columbian and the Albion presses enabled the printer to print on one side of the paper at the rate of 250 sheets per hour. Such presses are now, except for peculiar kinds of work or when very few impressions of a forme are required, quite obsolete, being superseded by 'machines' on which the various operations of press-work are done more or less automatically.

The earliest inventors of 'printing' machines coupled together the two arts of printing on paper and on calico and other textile fabrics. Adkin and Walker in 1772 patented a machine which was the type of a modern rotary letterpress machine. It was 'for stamping and printing' on paper, cotton, and other cloths, 'whereby the printing on such materials would be greatly facilitated and rendered much less expensive, and more perfect and exact.' The words fully and clearly indicate the importance of rotative motions of roller and forme in printing. Amongst other suggestions of a cognate nature made about this time the most remarkable was that of William Nicholson of London, the editor of a scientific journal. In 1790 he took out a patent which foreshadowed nearly every fundamental improvement into what we now call rotary printing-machines of the present day. He contemplated an apparatus in which forms or plates were to be fastened to the surface of a cylinder; the inking to be supplied by a roller and distributed by smaller rollers; the forme to be cylinder-fed, the paper being caused to pass between the printing cylinder and one covered with cloth or leather. Nicholson never actually constructed a machine, and although his patent was a marvellous forecast of the methods soon to be adopted in letterpress printing, he remains as the honour of being the inventor of the printing-machine.

Hitherto the evolution of the type-printing machine from the calico-printing machine has been completely overlooked by historians of printing, yet the connection is almost obvious. Nicholson's apparatus was closely similar, to the same extent that the distinction of first actually making a printing-machine was reserved for a German printer, Freidrick König (q.v.), who commenced experiments with the modest, and, as it proved, mistaken view of accelerating by making more automatic the ordinary hand-presses. He came to London about 1800, and patented a new platen-machine. The idea was but crude, and never put into execution. It is not unlikely that about this time König became acquainted with the ideas patented by Nicholson (see Goebel, Friedrich König und die Erfindung der Schnell-pressen, Stuttgart, 1853). At any rate König abandoned his project for accelerating flat printing. In 1811 he took out a patent for what we would now call a single-cylinder machine—i.e. one in which the impression was given by a cylinder, the inking being done by rollers, and the paper carried through the apparatus on tapes. The type bed moved to and fro, and the cylinder had an intermittent or stop motion, affording time for the feeding of the sheets. The glue and treacle composition had not been discovered, and leather ink-rolling or Moro ink-rolling was used instead. The Times was so struck with the apparent possibilities of this method of printing that he engaged König to make for him a double-cylinder machine which should print two copies of a forme of the newspaper, but on one side only of the sheet at once. This was completed in 1814, and on the 28th November of that year a newspaper was for the first time in any country printed by a machine driven by steam-power. This machine printed 1800 impressions per hour, completing 900 sheets, and it was called the König's Times Press. In 1818 Edward Cowper invented several important improvements, including a flat ink-distributing table, with distributing-rollers, forme-inking rollers, and ink-fountain. These principles are still to be found in single-cylinder machines. Cowper was called upon by Mr. John König to improve his press, mainly by taking away the old ink-rolling apparatus and substituting his own. In the same year König patented a perfecting machine which resembled two single-cylinder machines placed with their impression-tubes towards each other. The sheet was conveyed from one cylinder to the other by means of tapes so arranged that in the course of its track it was turned over and the second side presented to the second cylinder. At the first cylinder the sheet received its impression from the
first forme, and at the second cylinder it received its impression from the second forme. Cowper also improved on this machine, which printed 750 sheets on both sides of the paper per hour. The principle of the first perfecting machine has not been considerably departed from in subsequent machines of the same class, but improved methods have been devised for carrying the sheet from one cylinder to the other and turning it.

Reference, extremely brief and imperfect, has now been made to the origin of two out of the three distinct classes of printing-machines at present in use. These are, first, the single-cylinder machine, printing one side of the sheet at one operation, from a forme lying on a flat bed; second, the double-cylinder or perfecting machine, printing both sides of the sheet at once, also from a forme on a flat bed. The third class comprises the rotary machines, printing both sides, but from a circular forme—the impression surface, as well as the printing and the inking surface, being cylindrical, and capable of continuous rotation. The machines of the first and second classes are adapted for single sheets of paper; the rotary machines print reels or continuous webs, the portion forming a sheet being severed after printing. It is in this latter class of machines that the greatest improve-

ments—amounting almost to a revolution in the art of printing—have been achieved. (For a technical account of the several classes, see Principles and Progress of Printing Machinery, by the present writer, Lond. 1889.) Limitations of space preclude more being given here than a bare list of successive improvements.

In 1790, as already mentioned, Nicholson patented a rotary machine, but he never constructed one. In 1813 Bacon and Donkin patented a machine in which the types were fixed on a revolving prism, the ink being applied by a roller, and the sheet of paper wrapped on another prism. The machine was a failure, although it embraced an important feature, the inking-roller made of composition. Three years afterwards Cowper patented a method for printing paper for paper-hangings and other purposes. This embodied another valuable feature—the taking a cast from the type and bending the cast round a cylinder. It was a far more practical idea than the subsequent one of Rowland Hill, who, to procure a curved printing surface, proposed the use of tapering types to be fixed on the cylinder. In 1848 Applegath invented a machine, the type-cylinder of which was vertical and nearly 6 feet in diameter, around it being placed eight other cylinders, containing sheets of paper to be printed. These were led in from a horizontal position, and then brought to the vertical position. In 1857 the Times discarded this machine in favour of one patented by Hoe of New York, very similar in construction, but the cylinders were horizontal. It was found that the complication arising from eight or ten feeders was most objectionable, causing frequent stoppages, excessive waste of paper, and great risk to the machine and the material, while the working cost was heavy. Each of the machines printed on one side only. They were the first machines fitted with 'flyers'—a device for mechanically delivering or taking off the sheets. It was, however, considered at the Times office that the name of improvement could only be obtained by constructing a machine simple in its arrangements, capable of printing both sides of the paper at one operation, and which could print, not single sheets, but continuous webs of paper, thus dispensing with layers-on. There were enormous difficulties in the way of printing, cutting, and delivering the paper, difficulties which the non-professional reader could by no means realise. In 1866 a machine of the kind was constructed under the superintendence of Mr. J. C. Macdonald, the manager, and Mr. Calverley, chief-engineer of the Times. The Walter Press, as this machine was named, has since been slightly improved, but remains practically the same, and is shown in fig. 6. The types are stereotype by means of a paper-maché mould, which, being bent inside a hollow cylinder, produces, when cast, a stereotype which fits on the printing-cylinder of the machine. The paper, unwinding from the reel, first passes between damping-cylinders, then over the printing

Fig. 6.—The Walter Press.
cylinders, and is finally cut and delivered at the
other end of the machine. Two boys and a man,
who superintends the machine, supply all the
manual labour required. The speed is about 10,000
perfect sheets per hour, equal to 20,000 impressions
by the apparatus previously mentioned. The more
recent machines have an attachment for folding,
which make two, three, or four folds as required.

Mr Walter of the Times is entitled to the
honour of being instrumental in introducing the
system of rotary printing for news-work, just as
his father deserves that of having introduced steam
machine-printing. The Walker press was soon
adopted as the pattern of a number of machines
constructed in Britain and abroad. Some of these
machines much developed the idea of the Walker,
and embodied fresh and important improvements.
In 1870 Messrs George Duncan and Alexander
Wilson, of Liverpool, brought out their 'Victory'
machine, which included the folding arrangement
since added to the Walker press.

By this apparatus newspapers of
various sizes are printed, folded,
delivered, and counted into
quires or any portion required,
at the rate of 200 per minute.

Since about 1870 the rotary
system of printing has been
gradually adopted in the offices
of all newspapers having even
moderately large circulations.
Factories for producing rotary
machines have been established
in various parts of England,
while many such machines have
been imported from France,
Germany, and America. The
most improved and the fastest
machines made up to the present
time are those of Messrs Hoe &
The most improved of these
machines print four or six page
papers at the extraordinary
speed of 48,000 per hour, or 800
per minute. Papers of eight,
ten, or twelve pages can be printed at a speed of
24,000 per hour, and a sixteen page paper at 12,000
per hour. The papers can be pasted down the
centre margins if required, and counted as delivered
in quires of any number fixed upon. The machine
delivers the papers, inset, pasted, cut top and
bottom, turned out as compact as a pamphlet, and,
by the addition of a device largely used in America,
even folded and wrappered ready for use. This
speed is effected by using a reel of paper of double
width, about 8 feet wide, on which can be printed
duplicate sets of plates. So greatly has the art of
Stereotyping (q.v.) been improved that eight stereoplates
from one forme can now be moulded, cast,
and finished ready for the machine in eight minutes.
Fig. 7 shows the double-web Hoe machine.

The printing business
is divided into three de-
partments — those con-
cerned respectively with
jobbing or commercial
work, book-work, and
with news-work.
The improvements of late
years in the mechanism
and the processes of the
two are equally im-
portant with those in the
last. The character of
ordinary jobbing work
has been greatly bettered
by the liberal use and
correct selection of col-
ours, by the introduction
of ground tints, and by
the artistic taste infused
into the design. The
typefounders have pro-
vided the printer with
more beautiful types and
more diversified orna-
ments, and both press-
men and compositors have utilised with intel-
ligence and skill the materials at their command.
Jobbing work is chiefly done on small plate
machines, invented by an American, G. P. Gordon,
and introduced into Britain as 'Minerva Presses'
in 1866. There are many varieties now made of
this apparatus. Larger work is done on machines
having one or two cylinders. Those of the
'Wharfedale' pattern, invented about 1860 by
William Dawson and David Payne of Otley,

Fig. 7.—Hoe Double-web Machine.

Wharfedale, Yorks, have one cylinder, and print
only one side of the paper at a time.
The essential parts of the single-cylinder machine
(fig. 8), now constructed by engineers in Europe
and America, with small alterations in pattern,
may be regarded as five : the impression applicaness
of the cylinder; the arrangements for carrying the forms of type up to and under the cylinder, by contact of which it receives the impression; the inking of the type; the laying on of the sheet; the taking off or delivery of the sheet when printed. The cylinder, which is a hollow drum, having an opening on its under side, is placed almost in the middle of the machine. The table of the machine on which the forms are placed has racks on its under surface gearing into the traverse wheels, from which it derives motion to and fro. By means of racks it also causes the rotation of the cylinder by which the impression of the form is effected. The inking system may be thus outlined. There is at the extremity of the machine and running across it a duct or ink reservoir, with an adjustable side-piece called the knife, which regulates the outflow of ink. A composition roller in motion, called a vibrator, takes a streak of ink periodically and transfers it to the ink-table, which forms part of the table and of course moves backward and forward. The ink is evenly spread or distributed over the ink-table by 'distributors.' The table then passes under the inking-rollers which alone touch the forms and give it the proper coating of ink. The distributors and rollers are coated with 'composition,' referred to on p. 410. The feeding apparatus is also ingenious. A pile of paper is laid on to the desk-like table shown at the right-hand side of the machine, and a key stands at the end or at the front side of it and 'strikes' the sheets down till the front edge of one comes in contact with a series of metal fingers or clutches called grippers. These open and take a sheet by its edge, and hold it secure while the cylinder is turning round, and the printing taking place. At a certain point the grippers release the sheet, which then goes into the taking-off apparatus. A second set of grippers seize it and carry it round the wooden flyer cylinder, from whence it emerges on to travelling tapes. A large comb-like appliance called the gate oscillates up and down, having the sheet in front. The pressure of the air causes the sheet to adhere to this until it assumes a horizontal position, when it drops on to the taking-off board. While the first side of the sheet is being printed, two points, by an ingenious arrangement, make small holes in the paper; and when the sheet is turned to print the second side, these holes are again placed on the 'points,' thus ensuring correct register.

Machines with two cylinders are called perfecting machines because they perfect or print both sides of a sheet before delivering it. Generally they may be said to be duplicated single machines, with two printing-cylinders, two tables for type, and an inking apparatus at either end, much as described under the single-cylinder machine. The sheet is printed on one side at the first cylinder, when a set of grippers on the second cylinder take possession of it and print the second side, and it is delivered by the flyer as described. The varieties of these machines are numerous, and fig. 9 shows the Marinoni, a well-known type, used in the printing of the British editions of the present work. These machines can print in the very finest manner from 1000 to 1500 perfectoed sheets per hour, according as they may be complicated with illustrations or not.

When the types are to be printed from direct, as already mentioned, the chase containing the pages is put on the bed of the machine. When stereotype or electrotype plates are used they are carefully dressed to an exact size and thickness, the latter about ¼ inch of an inch. The requisite number of wooden blocks are then put on the machine-bed, locked in a chase. These blocks are of the proper thickness to make up the plates to type-height (about 1 inch). The plates are fastened to the blocks by brass catches at the sides and ends, and when locked up are as solid as type.

Before printing, however, a laborious process called making ready has to be gone through. When many wood-engravings are in the pages several days may be taken up making ready a single sheet. This process is for the purpose of making the impression equal all over and properly printing the wood-engravings, and can be judged of by comparing a carefully printed book with a daily newspaper, which is printed just as it comes without any making ready. It is too technical for detailed description within our limits.

It is not long since that it was a firm article of belief among printers that fine work could not be done except on a press provided with a platen. And up to quite recently all paper was first thoroughly wetted, then printed, then dried, and then pressed to restore the surface, of which the damping deprived it, and to give it a certain gloss. Between the forme and the platen of the press or the cylinder of the machine a thick, soft, yielding blanket was placed, which was supposed to produce a better impression from the inequalities of engravings and type. There has been a radical change in opinion and practice on these important points. It has been found, since machines
have been brought to their present degree of perfection, that they give far superior results to those from presses— their impression is stronger, more solid, and more uniform, and the sheets can be laid on them with a precision unattainable by hand presses. Paper is not now made spongy and stretchable by being wetted, and the result of working in the press is that the impressions of the characters are of greater brightness, and the delicate lines of engravings are printed finer, clearer, and cleaner. Improvements in ink-making have much conduced to this desirable result. Paper has been produced for book-kinds with a special propriety. Early printed sheets, which admits of a far more excellent impression than that formerly procurable. The soft blanket has been discarded, and the padding or covering of the cylinder is now generally as hard as it can be got. The aggregate results of these alterations may be seen by a comparison of the present issues of an illustrated newspaper with those of fifty years ago. Up to about 1840 there was actually no press strong enough to properly print a woodcut of 48 square inches in superfine; now, woodcuts of 2000 square inches, or 90 inches by 40, are printed in the usual way with perfect simplicity. The improvements of the pictorial journals are often admirable reproductions of works of high art; it is within the memory of persons of middle age that the first crude attempts were made to print such pictures.

BIBLIOGRAPHY.—Historical: In addition to the works referred to in the text may be mentioned Karl Paulmann, Illustrirte Geschichte der Buchdruckerkunst (Vienna, 1882), his Die Erfindung der Buchdruckkunst, nach der neuesten Forschungen (Vienna, 1881); Theo. de Vigne, The Invention of Printing (New York, 1877); and Van der Linden, Geschichte der Erfindung der Buchdruck (3 vols. Berlin, 1886). There is no complete history of printing in the English language, but in Bigners and Wyman's Bibliography of Printing (3 vols., London, 1890) some of the most useful books will be found under the names of Ames, Arber, Bayles, Dibdin, Herbert, Hansard, Humphreys, Hessel, Luckombe, Otley, T. B. Reed, Sotherby, Timperley, and Watson.

Practical.—Southworth, Practical Printing (2 vols. 3d ed. 1887), and Printing Machines and Printing Machine (1888); Waldow, Illustrirte Encyclopadie der Grafsehnen Kunst (Leip., 1884); Descriptions, Nouvelles de Typographie (Paris, 1888); F. J. F. Wilson, Printing Machines (3d ed. 1885); F. J. Jacobi, Printing (1890); The American Dictionary of Printing and Bookmaking (3d ed., New York, 1888); America'n Encyclopedia of Printing (New York, 1871). Besides, a multitude of small yet useful books have been written on separate branches, and for the use of professional students of the art. See also the following books on the TRATION OF BOOKS, LITHOGRAPHY, PAPER, PRESSES (Freedom of the), PROOFS, STEREOTYPING, TYPES.

PRINZENRAUB

PRIOR

PRIOR, Matthew, was born 21st July 1664. Some doubt prevails as to his birthplace; but the bulk of the evidence points to Wimborne Minster in East Dorset. His father is said to have been a joiner, who, coming to London, probably to educate his son, took up his abode in Stephen's Alley, Westminster, where the future poet was then under the redoubtable Dr Busby. His father died, and, his mother being unable to pay his schoolfees, he fell into the care of his uncle, a vintner in Channel (now Cannon) Row, who took him into the toil and toil of perfect man. The sailor-like clothes of Horace and Ovid attracted the attention of Charles Earl of Dorset, and other visitors to the Rhinish Wine House, with the result that he returned to Westminster, his uncle finding him in clothes, and Dorset in books. At Westminster he formed a life-long friendship with John Dryden, a friendship which, when founded by George Montague, the elder of whom afterwards became Earl of Halifax, in order to follow his friends to Cambridge. Prior, against Lord Dorset's wish, accepted a scholarship from the Duchess of Somerset at St John's College. He was admitted Bachelor in 1686, and in the following year wrote with Charles Montague the clever parody of Dryden, entitled The Hind and the Panther transvers'd to the Story of the Country-mouse and the City-mouse, which, according to some, he wrote in the same night of the copy of Dryden. In April 1688 Prior obtained a fellowship; and his composition of the yearly college tribute to the Exeter family, a rhymed exemplum upon Exodus, iii. 14, led to his going to Burleigh as tutor to Lord Exeter's sons, and, on his master's death, to be removed to Italy, and Prior applied (through Fleetwood Shepherd) to his former patron Dorset for advancement. He was, being then twenty-six, made secretary to Lord Dursley, afterwards Earl of Berkeley, then going as ambassador to the Hague. In Holland Prior remained some years, finding especial favour with King William. In 1697 he brought over the Articles of Peace at the treaty of Ryswick; and, after being nominated Secretary of State for Ireland, he was made secretary in 1698 to the Earl of Portland's embassy to France, continuing in that office until 1700. In Scotland he found favour both with Anne and Louis XIV. In 1699 he became an under-secretary of state, the university of Cambridge made him an M.A., and he succeeded Locke as commissioner of trade and plantations. In 1701 he entered parliament as member for East Bedfort. His plantations, from the Terri, and in 1711 was employed in the preliminaries of the peace of Utrecht, going to Paris as ambassador in the following year. With the queen's death in 1714 came the triumph of the Whigs, and in 1715 Prior, returning to England, was immediately imprisoned. In 1717 he was excepted from the Act of Grace, but was, none the less, subsequently discharged. The remainder of his life was passed chiefly at Down-Hall in Essex, a country-house purchased partly with the profits from a subscribition edition of his poems and partly with the assistance of his friend Lord Harley, at whose seat of Wimpole he died, 18th September 1721, being then in his fifty-eighth year. He was buried in Westminster Abbey, under a monument decorated by his bust by Antoine Coysevox, given to him by Lord Marlborough. His poetical scenes, The History of Richardon (National Portrait Gallery), by Belle (St John's College), Kneller, Dahl, and others.

Of Prior's abilities as a diplomatist there are diverse opinions. Pope sneered at them. But Bolingbroke and Swift extolled them; and it is stated that the archives at Paris show him to have been far able and more resourceful than is generally supposed. As a poet, in which capacity he is now remembered, he holds a unique position. Without much real sentiment or humanity, his verses have a wit, a grace, a neatness and a finish, which link him to the lighter Latin poets on the one hand, and to the best French writers of familiar verse on the other. Cowper praised his 'easy jingle,' Thackeray 'his good sense, his happy easy turns and melody.' He collected his poems, described by himself as consisting of 'Publick Panegyrics, Amorous Odes, Serious Reflections, or Idle Tales' (many of which had been contributed to Dryden's and other miscellanies), in 1709, and again, in extended form, in 1718. By this latter issue he made 1440 guineas. The satire on Dryden's pieces, Simon, the Vanity of the World and a paraphrase of the old ballad of the Nut Brown Maid, are not now thought to be his best, although they had considerable popularity with the readers of the 18th century. But a third long poem, Alma; or, the Progress of an Unhappy Woman, a 'climacteric' full of wit and waywardness. His Tales resemble the French contes too much in their objectionable
qualities to be palatable to the English taste. He lives mainly by his purely playful efforts, his lyrics and his epigrams, not a few of which are unsurpassable. In the kind of piece known to the French as vers d'occasion he is unrivaled, and his beautiful stanzas to A Child of Quality have been as fortunate as Gray's Elegy in a Country Churchyard, setting the tune to a host of plagiarists. In 1740, long after his death, two volumes were published, one containing alleged Memoirs, in which there is little of his, and the other a number of posthumous verses, among which are some of his best. These are included in Evans's two-volume edition of 1777. Thehecakesy wrote admiringly of Prior in his English Humourists (1853). See his Selected Poems, edited by the writer of this notice (Parchment Library, 1889); an article by Sir G. A. Aitken in the Contemporary Review for May 1890; and the edition of Prior's works by R. Brinley Johnson (2 vols. 1892).

Priscian (Lat. Priscianus), surnamed Cassarins, born or educated in Cæsarea, is in point of reputation the first of Latin grammarians; his treatise was in universal use as a text-book during the middle ages. Priscian flourished in the beginning of the 6th century: Paulinus Diaconus calls him a contemporary of Cassiodorus (468-562 A.D.). He taught Latin at Constantinople, and enjoyed a government salary. The work which has preserved his name is his Commentariorum Grammaticarum Libri XVIII. The first sixteen books treat of the different parts of speech; the remaining two, of syntax. The work shows great learning and good sense, and contains quotations from many Greek and Latin authors no longer extant. Priscian also wrote six smaller grammatical treatises, and two hexameter poems of the didactic sort, De Laudc Imperatoris Anastasii and a free translation of the Periegesis of Dionysius. The best edition of the grammatical works is that by Horta and Keil in Keil's Grammatici Latini, vols. ii. and iii. (1853-60); of the poems, by Bähr, in Poetae Latinhi Minorae, vol. v. (1883).

Priscillian, the chief propagator of the doctrines professed by the sect known from his name as Priscillianists. They spread widely in Spain during the last third of the 4th century, and lingered there till the beginning of the 5th century. The first seed of their doctrines is said to have been carried into Spain by a Memphian named Marcus, whose earliest disciples were Agape, a Spanish lady, and Helphinus, a rhetorician. Priscillian was a man of noble birth, pious and well educated; and his eloquence and boldness of character soon gathered round him a group of devoted followers, including two bishops, Instantius and Salvianus. From their hands he received episcopal ordination, and he established his see at Avila (Abila). Hyginus, bishop of Cordova, was the first to take action against these innovators; but his measures were covered with reproaches by the ultra-orthodox and fanatical. Priscillian's most determined enemies were Idacius, bishop of Emerita (Merida), and Iulicius, bishop of Sosonea. He was condemned and excommunicated at the synod of Saragossa (381), with three others, of the leaders of the party. They next went to Rome to clear themselves before the pope, but were denied audience, and at Milan on the return journey they met as little sympathy from Ambrose. Under the vallating rule of Gratian, however, they prospered, and the war between the two parties ended in the usurpation of Clemens Maximus. From the judgment of the synod of Bordeaux (384) Priscillian appeared as Paul to Cesar, and was at length summoned to appear at Treves. Martin of Tours was in favour of tolerant measures, but after his departure the fanatical party prevailed, and Priscillian, with others of the party, was condemned and put to death—the first who suffered death for heresy (385). Many Priscillianists recanted after the synod of Toledo (400), and soon after that of 447 they disappear altogether. Their doctrines contained 10 tenets, of which three were of the most distinctive, and the rest were mere speculations on primitive dualism, the doctrine of emanations and astrological fatalism. They practised rigid asceticism, and eschewed marriage and the use of animal food. One dashing hit on their morals was that absolute veracity was only obligatory on the lower orders; and there were those who still were made against their morality; but it should be remembered that the only accounts we have are those of bitter enemies, and their principles, originally obscure enough, have been made darker by a cloud of calumny. If the Priscillianists violated the laws of nature,' says Gibbon, 'it was not by the licentiousness but by the severity of their lives.'

See Mansel's Gnostic Heresies and Neander's Church History; also Mandernach's Geschichte des Priscillianismus (Treves, 1851). Scheppe claims to have discovered some of his writings in an enlarged edition of the Scholion to the Scriptorium Ecclesiasticorum Latinorum (Vienna, 1888).

Prism, in Geometry, a solid figure which can be most easily conceived of if we imagine a number of plane figures (triangles, quadrilaterals, &c.) exactly similar in form and size to be cut out of paper on a square or circular plate, or other, and then the whole plate to become one body. It will thus be seen that the top and bottom of the prism are similar, equal, and parallel to each other, and that the sides are plane figures, rectangular if the prism be 'right' (i.e. if in the above illustration the pile of plane figures lies upon a perpendicular plane, and rhomboidal if the prism be 'oblique' (i.e. if the pile slope to one side); but under all circumstances the sides of a prism must be parallelograms. The top and bottom faces may be either triangles, squares, parallelograms, or quadrilaterals of any sort, or figures of five, six, seven, &c. sides, provided only both are alike; and the number of sides is the plane figure which forms the top or bottom of course determines the number of faces of the prism: thus, in a triangular prism, there are five faces in all (three sides and two ends); in a quadrangular prism, six faces (four sides and two ends), &c. If two of the faces, one being 'right,' and the other 'oblique,' have their bases of equal area, and be of the same vertical height, their solid content is the same, and is found by multiplying the area of the base by the vertical height. The paralleloipid is a quadratic prism, and the cube is a particular case of the paralleloipid.

Prism, in Optics, is a triangular prism of glass or other transparent substance, its two ends being isosceles triangles, and having most frequently a very acute vertical angle, which gives the prism the appearance of a long wedge. It is the most important instrument in experiments on the refraction of light, and, in the hands of the most eminent optical philosophers, has been the means of largely adding to the science of optics. See OPTICS, REFRACTION, SPECTRUM.

Prisoners of War are those who are captured from the enemy during naval or military operations. By the laws or recognised principles of war, the entire people of a vanquished town, state, or nation become the absolute property of the victors. In ancient times the treatment of prisoners of war was very severe. In the Greek wars it was no uncommon thing to put the whole adult male population of a conquered state to the sword, while the women and children were enslaved. Although the putting to death of prisoners became less frequent, they and their families were commonly reduced to slavery to as recent a period as the 15th
century. The act of Napoleon in putting to death the Turkish prisoners of war at Jaffa in 1799 was universally condemned, and is probably the last instance of such barbarity. By degrees the mere humane custom of excusing prisoners came into practice, these not exchanged being kept in confinement on very poor fare. Notwithstanding frequent exchanges, large numbers of prisoners escaped the common law and consequently the bond of allegiance, and consequently the prison of war, was many of the officers being released on parole (q.v.).

**Prisons.** Formerly used for the purpose of restraint chiefly, it is only within recent times that imprisonment has been studied as a means by which certain high objects are to be attained, and which therefore render theconducted according to recognized principles. It used to be believed that nothing more was required than to ensure the security of the victim or culprit, by chains and fetters if necessary, unless it were to inflict on him all the further bodily pains and penalties, the smallest of which would be the breach of the prison regulations, and the death of the warden ordered by design. Imprisonment was not mentioned in the Anglo-Saxon laws as a punishment, but was enforced when an offender committed a punishable crime; and the punishment was, as well as specified by statute for particular offenders; nevertheless gaols were actually used more for securing the persons of those committed to them than as places of punishment. Under the common law all gaols belonged to the king, and by 5 Hen. IV. chap. 10 it was enacted that none but the common gaol should be the place of imprisonment for offenders brought before a justice of the peace. But there were many "franchise" gaols owned by great persons, or by towns, or by the crown, and gaols were lawful places for carrying out imprisonment ordered by the persons or bodies to whom these privileges were granted as a part of the criminal jurisdiction placed in their hands. In many cases these bodies had the power of life and death. In the reign of Edward VI. and Queen Elizabeth a new description of place of confinement was introduced—viz. the "briddles" and "houses of correction" for vagabonds, &c. By James I. chap. 4, every county was required to provide such an establishment with suitable instruments and appliances in it for setting idle people to work. Another sort of prison is of quite recent introduction—viz. the reformatory and industrial school, institutions which are under private management, but derive the greater part of the funds by which they are maintained from public sources, and are subject to certain general rules and conditions intended to secure efficiency and to prevent abuse, compliance with which is ensured by government inspection. These institutions are for the reception of juveniles whom modern philanthropy has rightly more appropriate for the latter. Reformatories are places of punishment for juveniles under sixteen years of age who are convicted of crime, and sentenced to ten days' imprisonment or more. Industrial schools are not intended for punishment at all, but are intended to prevent children becoming criminals through parental neglect or misconduct. A child must be under fourteen years of age to justify his being sent to an industrial school. There are therefore (1) prisons to which adults are sent for punishment and reformation; (2) prisons to which juveniles are sent for punishment and reformation; (3) industrial schools; (4) reformatory schools; (5) prisons or places of compulsory detention to which juveniles are sent as a preventive measure, called industrial schools. To the first of these are sent also persons who are charged with a crime to await their trial, and persons committed by county courts for debt, &c. In 1879, 47,000 French were prisoners in England, while 10,300 English languished in the prisons of France. By the end of the Franco-German war of 1870-71 about 300,000 French troops had been sent to German provinces, prisoners of war, many of the officers being released on parole (q.v.).

*Copyright 1891, 1897, and 1900 in the U.S. by J. B. Lippincott Company.*
employed on useful labour. Chap. 74 of the 19th Geo. Ill., after reciting that 'the punishment of felons and other offenders by transportation to His Majesty's Colonies and Plantations in America attended with many Difficulties,' and enacting that such offenders might be transported elsewhere, and that offenders who might be sentenced to be burned in the hand might instead be fined or whipped, proceeds to say that 'whereas, if many offenders convicted of crimes for which Transportation hath usually been inflicted were ordered to solitary imprisonment accompanied by well-regulated labour and religious instruction, it might be the means under Providence not only of deterring others from the commission of the like crimes, but also of reforming the morals and improving the habits of industry, it shall be lawful to appoint supervisors who shall erect penitentiaries where such persons may be ordered to imprisonment and hard labour. The first hulks were established in 1776; and this fatal temporary expedient serves to illustrate the scream as to the superior permanency of temporary expediency, for the last hulk was not closed until a fire destroyed it in 1857; and in fact they had a perfect representative in Gibraltar prison, which was constructed on the model of a hulk and developed all the iniquities of these establishments, and which was closed by the increased opposition to its abolition by the local naval and military authorities. Many years were destined to pass before the permanent penitentiary system became a fact. Great efforts were made to revive the transportation system, and in 1787 a new penal colony was founded in Australia. This with the hulks continued to form the punishment next in gravity to capital execution until the last hulk was closed in 1857 and the last batch of convicts was sent to Western Australia in 1867. It is not necessary to describe the hulk system, if system it can be called in which the inmates were herded together in unchecked association, where 'vice, profaneness, and demoralisation developed, as might be expected, among persons of the basest character, of whom the worst and the most demoralised were likely soon to take the lead, and after they had been to the hulks for a lifetime were described by a committee of the House of Commons in 1832 as 'well fed, well clothed, indulging in riotous enjoyment by night, with moderate labour by day, so that life in them is considered a pretty jolly life. But the hulks flourished in full vigour for many years, after the last one was closed in 1867, and in fact an attempt was then made to abolish them, which was the only way to put an end to the evils so forcibly commented on.

The history of the phases through which the control and supervision of the hulks passed is, however, of consequence, as it explains the present administration of the convict prisons and shows what methods failed, and furnishes warnings against adopting certain suggestions that are made from time to time. The hulks were at first, like all other prisons, placed under the management of the local justices, who appointed the overseer, and the overseer appointed the officers; the justices also made the overseer contractor for the maintenance of the prisoners, and as it was obviously his interest as contractor to cut short the supplies of food and clothing for the prisoners, they therefore by the darkness of a criminal interest should be diametrically opposed to his duty and to the welfare of the prisoners in his charge. The supervision of the hulks resided in the Court of King's Bench, who steadily neglected their duty, and the inspector provided for by parliament was not appointed in the way desired by the Home Secretary usurped power over these establishments, and his action was endorsed by parlia-

ment in 1815; and their connection with the King's Bench was severed in 1823. An Inspector was appointed, and after that a superintendent; and after some years the inspection of the hulks was in 1850 vested in the Board of Directors of Convict Prisons, with whom it now rests. The control of Millbank Prison, Pentonville Prison, and Parkhurst Reformatory was confided to the same body.

Transportation to Australia, which was commenced in 1787, for many years provided for only a small part of the persons subjected to that sentence or whose capital sentences were commuted for transportation. Until 1816 an average of only 474 prisoners was transported annually to Australia, but after that the number amounted to 4920. Transportation in its most flourishing days was characterised by evils which rivalled if they did not sometimes surpass those of the hulks.

Whilst, however, it was in full vigour a step was taken, feebly and slowly indeed, towards the creation of the penitentiaries intended in 1776 to form a permanent substitute for transportation to America. Millbank Prison (q.v.) provided means for the confinement of every prisoner in absolute separation, according to the modern doctrine, and it was intended that treatment should be on the most advanced reformatory system; but this experiment went no further at this time. In 1833 the existence of the terrible evils which attended the transportation system were formally established by the report of a commission, who said that the system was unequal, without terror to the criminal class, corrupting to both convict and colonist, and very expensive, and they recommended punishment in penitentiaries instead.

Various improvements in the Millbank system were introduced after this, and finally in 1842 it took the form of passing the convicts through two stages of discipline in certain prisons at home before sending them to complete their sentences in one of the colonies. The first of these stages was passed in a prison in which each inmate was kept in complete separation and brought under influences by which he was prepared for the foundation reform in his character; the second in a prison in which he was employed in useful public works in regulated association, but confined in a cell by himself by night and at all times when not at work or in chapel. The complete efficiency of this stage began to be felt at that period. The convicts being placed in association at night, but for some time past the separation has been thoroughly carried out, the only exception being in the cases of prisoners who on medical grounds cannot properly be left alone. The first stage was regulated according to the system adopted, first experimentally, at the new model prison at Pentonville which had been erected in 1842. When the experiment had been proved to be successful, convicts were sent to undergo it at Millbank Prison and at other prisons of which the construction was suitable.

In those early days of the formation of the convict system the confinement of prisoners in complete separation was regarded with great prejudice. This arose from the reports of its results in certain prisons in America, where it had been some years before carried out with the accompaniments of its darkness of a criminal interest, of cruel and inhuman treatment, and unwholesome sanitary conditions. It was therefore decided after some experiments, and as a sort of compromise with the prejudices above referred to, that the period of separation should be limited to nine months. Since the date when this decision was made, much improvement has been gained, and the unsoundness of the grounds on which this limitation was founded has been fully
demonstrated (see the Report of the Directors of Convict Prisons, 1887-88, and the accompanying report of an inquiry into the subject by the medical inspector). The whole of the prisons in the United Kingdom where sentences up to two years are carried out have gradually been remodelled on the sententious lines laid down by that Board, and by several foreign countries, after full investigation, permit of the isolation of prisoners under proper conditions for much longer periods. There is, therefore, no reason why the separate stage of a sentence of penal servitude should not endure for a period of these years, and those sentenced in that condition under a sentence of imprisonment.

The second or public works stage was carried out in prisons like Portland, which was constructed for the purpose in 1847. Dartmoor Convict Prison was opened in 1850 for the same purpose, Portsmouth Prison in 1852, Chatham in 1856, &c. In these the convicts have been employed in large public works, in farming, &c. The breakwater at Portland, the fortifications of that island, the large extension of the dockyards at Chatham and Portsmouth, the forts which protect Chatham, and various other works, both public and private, besides the construction of large prison establishments, attest the advantages of the system, which also enables the prisoners to gain a useful knowledge of trades by which they can obtain employment on their release, and affords them an immediate influence in accustoming the prisoners to habits of industry.

From 1844, and more rapidly after 1852, the number of prisoners actually transported gradually diminished; most of those who received that sentence were discharged on free pardon in Britain after serving their terms, and a smaller number were transported for shorter periods, as the result of amendment of practice and legislation. In the course of time the opposition of the Australian colonies to the continuance of transportation led to the abandonment of the system altogether, and since 1867 no convicts have been sent to those colonies. The punishment of penal servitude was by various acts passed between 1833 and 1864 substituted for transportation. These acts introduced certain notable modifications in regard to sentences of the next degree of gravity to capital punishment. When transportation was in force, and in some cases, the sentence was passed might be treated in any of various different ways. Commencing his sentence in the local prison, where he remained until it was thought proper to remove him, he might be transferred either (1) to Australia, from which in all probability he never returned, whatever the length of his sentence; (2) to Gibraltar or Bermuda, from which he was brought back to England when he had served a certain portion of his sentence, and there discharged; or (3) to the hulks, or to the 'public works' prisons substituted for them. If he went to Australia he was in the early days assigned as a servant to some free settler, and so at once ceased to be actually a prisoner; but in later years a system was established under which all prisoners first passed a certain time in a convict establishment and then were discharged conditionally, to have to the hulks or to the 'public works' prisons which replaced them, or to one of the convict establishments abroad. If sent to the hulks or 'public works' prisons they might either remain there till discharged, or be drafted off to one of the convict establishments in the colonies. When transportation was abolished and the segregation of the convicts was followed, in none of them did they pass the whole of their sentences in the condition of prisoners, a most important consideration to bear in mind. Those who were sent to Gibraltar or Bermuda, as well as those who did not leave the country at all, but were confined in the hulks, were released on free pardon after they had passed about half of their sentences or a little more. Those who went to Australia were detained usually for four years, but in their case only on certain conditions, by which a hold over them was maintained. When the objections of the Australian colonies to the continuance of transportation thither made it necessary to adopt some other plan for disposing of those prisoners whom the Penal Code considered in that condition under a sentence of imprisonment.

Under this act a sentence of transportation could not be passed for less than fourteen years, and a sentence of penal servitude was substituted for all lower terms. But the sentences of penal servitude permitted by this act were shorter than the sentences of transportation assigned to various crimes under the old acts, because it was intended that those sentenced to transportation who would not be passed in confinement; the terms were therefore fixed so as to correspond with the periods which had actually been passed in prison by convicts who had been sentenced to transportation but not actually sent out of the country. For seven years' transportation or less, transportation was substituted for penal servitude; for over seven but not over ten years' transportation was substituted not under four years and not over six years; for over ten but not over fifteen years' transportation was substituted not under six years and not over ten years; for over fifteen years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substituted for any term of sentence. After seven years' transportation was not substitut
offence which might be punished by seven years' transportation. In carrying out this act prisoners were allowed to gain remission of a portion of these short sentences as well as all the others.

About this time very warm discussions were being carried on as to the subject of penal systems, originating in the expectation of the Act of 1857, which necessitated by the gradual abolition of transportation; and about 1861-62 those who attacked the system which had actually been introduced were able to point to a recent increase of crime as a justification of their attacks on it, maintaining that the expectation of the time had been overruled. Great points were given to this feeling, and it was much intensified, by an outbreak of crimes of violence in the metropolis (garrotting), of which the number rose to eighty-two during the six months beginning June 1862, having been only sixteen in each six months from the beginning of 1860 to June 1862. The result was that a Royal Commission was appointed to report on the Penal Servitude Acts and the system adopted to carry them out. In consequence of the report of this commission in 1864 another Penal Servitude Act was passed, in which they did not adopt the recommendations of the Royal Commission as above set forth, but they raised the minimum term of penal servitude from three years to five years, except in the case of those who incurred a second sentence of penal servitude, in whose cases seven years was the minimum term permitted. This latter provision was repealed by the Prevention of Crimes Act, 1879.

A review by the light of later experience of the grounds on which the recommendation of the Royal Commission was made cannot but lead to the opinion that the expectation of the Act of 1857 has been too short to justify the formation of any sound opinion of its effects. As regards the outbreak of violence in the metropolis, this was without doubt, as subsequent events showed, the work of a small number of men who adopted that form of robbery (a very common feature in the history of crime), and when those men were arrested and received exemplary sentences the crime ceased altogether.

The remarkable feature of the figures for 1856-63 was that they were especially high in 1862-63, but rather the extraordinarily low level to which they have subsequently fallen in 1866, and from which they rebounded.

The directors of convict prisons in their recent annual reports had more than once referred to the anomaly peculiar to the United Kingdom by which no sentence was possible between two years—which was practically the limit of a sentence of imprisonment—and five years, which is the shortest legal sentence of penal servitude, and had expressed their opinion that it was desirable to introduce the power of sentencing to penal servitude for terms as low as three years, which existed from 1837 until the Act of 1857. Adopted by the recommendation of the report of a Royal Commission, founded, as the directors showed, upon erroneous deductions from imperfect data. In 1891 an act was passed to allow of the sentence of three years being imposed in future. By the Act of 1837 power was given to the Secretary of State to release convicts conditionally before the expiration of their sentences. This system, known as the ticket-of-leave system, was at the time strenuously attacked, under the erroneous supposition that it was introduced a system of releasing prisoners before they had completed their sentences; but this is not the case, as has been already stated, they never actually had done. On the contrary, under the ticket-of-leave system they were in point of fact detained to serve in prison a larger part of their sentences than had been customary before. Moreover, under the new system, instead of being absolutely pardoned when released, they were subject to revocation of their licenses if they did not conduct themselves well, by which their abstention from crime was materially guaranteed.

The principle on which the system of punishment is founded is founded on the idea that those who are subject to it should suffer discipline of such degree of severity as may act as a deterrent to them and to others who might be tempted to become criminals, but that they should at the same time be brought under the reformatory influences of religious teaching, good government, and education. It is by giving certain advantages to industry and good conduct, as well as inflicting suitable punishment for the reverse. Every effort is made to prevent that mutual contamination which was such a serious blot on prisons of the old type, and those prisoners who have not been previously convicted and are on inquiry found clearly to be only beginners in crime are formed into a separate body, who, from the badge by which they are distinguished, are called the Star class, and who are kept strictly apart from all others. The mode of carrying on the work is as follows: Every convict who receives this sentence is placed for the first nine months in a prison in which his whole time is passed in a separate cell, except, of course, the time devoted to public worship, necessary exercise, &c.; but at all times he is as far as possible isolated from his fellows. The remainder of his time in prison is passed in one of the large establishments in which useful work is carried on in a regulated association, and he is able by industry combined with good conduct to earn a remission of nearly one-fourth of his sentence, besides gaining certain privileges which are only available in regard to letter-writing, visits from his friends, and such like indulgences, and a gratuity to be paid to him on his discharge. The practice which existed until 1864 of encouraging industry and good conduct by certain increases in the diet was discontinued from that date, as it was held that to allow a prisoner more or better diet than absolutely necessary led to undesirable contrasts with poor but honest folk who could afford no such indulgences; and it will easily be seen that this principle, which is of course applicable to other things besides diet, makes it absolutely necessary to have a suitable system of rewards for prisoners while retaining the necessary penal or restrictive conditions of prison life.

At the head of every convict prison is the Governor, whose duty it is to administer and supervise all branches of the prison. He is assisted by a staff who have to control and regulate the discipline and employment of the prisoners, and a staff of clerks, who keep a record of all matters relating to the prisoners and their sentences, their conduct, &c.; and also by a steward or storekeeper, with assistant stewards, who are responsible for the maintenance and accounts. The chaplain conducts divine service, visits and advises the prisoners. He has under him schoolmasters, who conduct their education. A Roman Catholic priest is appointed to some prisons, and in them are collected all the prisoners of that denomination. The medical officer has charge of matters relating to the health of the prisoners. The hospital is constructed on the most modern principles, and provides accommodation for some patients in separation and for the association of those for whom the medical officer thinks it necessary. To this body a body called the Directors of Convict Prisons was created for England and Wales by statute in 1850, whose powers unite those of visiting justices of ordinary prisons with those of various bodies which had been created by parliament from time
to time to govern the various institutions thenceforward placed under their management—viz. Millbank Penitentiary, Pentonville Model Prison, Parkhurst Reformatory, the hulks, and the convict prisons at Portland, &c. The hulks for the herring fishery were superseded. A similar body was created for Ireland in 1824, and there a system founded on and closely resembling that which had been developed in England was created; but until 1888 (when a convict prison was established at Peterhead, and the prison hulks for the herring fishery were abolished) all male convicts sentenced in Scotland served the greater part of their sentences in convict prisons in England. The convict prisons are visited frequently by one or more of the directors, whose duty it is to see that the governor and the other officers of the prison are doing their duty, to hear and determine reports of misconduct of prisoners of such gravity that the governor cannot deal with them under the powers vested in him, and to hear and determine reports against the prison officers. To directors also the prisoners can complain or appeal if they consider they are not fairly treated, or bring forward any requests they have to make, but which the governor has no power to comply with. A body of gentlemen from among the magis-
trates is also appointed by the Secretary of State to act as independent visitors, and so form a fair and impartial guarantee against abuses in the prison, and a channel by which any grievances felt by any prisoner can be brought forward.

Each day marks are awarded to every prisoner according to his behaviour, and thus is measured daily his progress towards attaining that remission of about a quarter of his sentence which he is allowed to earn, as well as towards his promotion to a higher class, in which he may enjoy certain privileges before referred to. The punishments inflicted on those prisoners who misconduct themselves consist of close confinement, sometimes in a semi-darkened cell, reduction of diet, and forfeiture of the privileges already earned, such as gratuity to be paid on discharge, periodical visits, letters, visits from friends, &c., and forfeiture of remission, flogging, or being branded as a "cat" or a bird, which is awarded only in the gravest cases, such as assaults on warders, &c.

The cessation of transportation in 1867, and the consequent accumulation in the United Kingdom of all prisoners discharged on expiration of their sen-
tences who misconduct, instead of to a distant colony, might reasonably have been expected to increase the amount of serious crime, by the return of many of them to their former habits of life. As a matter of fact no such result has followed. On the contrary, the various influence which have been at work to check and repress crime, among which a well-regulated prison system may claim its due share, have enormously reduced the number of convicts under sentence.

About the beginning of the reign of Queen Victo-
ria, the population of England and Wales was about fifteen millions; there were 45,000 convicts in New South Wales and Van Diemen's Land, besides others in the colonial penal settlements, in the hulks at home about 3000 or 4000, several hundred at Millbank, about 900 each at Bermuda and the Bermudas, Antigua, &c. The number of those who misconduct, and whose conduct is so formulated, is now one of the matters of statistical inquiry. The number of prisoners, &c., in 1824 was 2219; this number has continually fallen, till in 1889 it was only 1039, and in 1890 only 828; yet during the interval the population of Great Britain has risen from 25,529,184 to (1891) 57,740,283. In Ireland the population of about 5,500,000, in 1869 there were 191 sentences of capital punishment, and in 1889, with a population of about 4,700,000, there were 83 such sentences. Of the present convict prison population in England and Wales, 515 have been placed on the Star class. These are found practically to be of an entirely different stamp from the habitual prisoners. They are more easy to manage, more willing and industrious, and experience shows that but few of them come back to a convict prison on reconviction after their discharge.

As regards the health of the prisoners in convict prisons, the statistics show that the favourable conditions under which they are placed on account of the great attention to sanitary requirements, the regularity of their lives, and the constant medical care taken of them result in a low mortality and a high percentage of remission, and this result is brought about in spite of a large proportion of the inmates of prisons being persons of low type, who have led dissipated and irregular lives. The conduct of the prisoners is, as a rule, very good; the result of a steady system of control under which exact discipline is enforced, and, while good conduct and industry are encour-
ged, misconduct is surely punished. The greater number of prisoners conform to the regulations so readily that either they do not inure any report or punishment of any kind, &c., most commit some trifling breach of regulations; and in fact the great bulk of the prison offences are committed by a few habitual offenders against the rules.

The prisons in which sentences of imprisonment are carried out have a separate history from that of those which have been described. There were so far back as two centuries ago occasional pro-
tests against the abuses and cruelties practised in prisons, and a notable parliamentary inquiry into the misconduct of a gaoler named Bembridge was held in 1730; but until the last quarter of the 19th century the idea that prisons into the strange claim for humane treatment had hardly made any way beyond the circle of a few philanthropic reformers; any attempt to use the period of im-
prisonment to improve the nature of the criminal was almost unknown. The way to better things was undoubtedly opened by Howard's visit and report on prison inspection about 1776, and in following years, and by his reports on the condition of the prisons he visited, followed as they were by pro-
posals for reform and improvements which were not immediately followed, but were engag-
ed in. The idea of improvement was at length encouraged by the statute of 1774, which gave to visit and inspect these prisons three times in each quarter, and to report on them to quarter sessions. In 1814 the appointment of chaplains was made compulsory. But compliance with these statutory reforms did not immediately follow, for indeed it was a long time before they had any practical effect. In 1818 there still remained 518 prisons in the United Kingdom, to which more than 100,000 prisoners were committed in the year,
and only twenty-three of these had been subdivided so as to enable the above classification to be carried out. In fifty-nine of them the males were not divided from the females (and in fact there was no statutory injunction to this effect until 3 Geo. IV. c. 59 was passed); it was therefore employment of any kind for the prisoners; in 100 of the gaols overcrowding was excessive; no less than 13,657 prisoners were crowded into the space which, according even to the moderate demands of those days, was fit for only 8545. The prisons were in many cases so ill provided that they became places of abandoned wickedness. In 1835 and 1839 most important legislative steps were taken. Further rules of administration were laid down in the acts passed in those years, and inspectors of prisons were appointed to see that they were carried out. By the latter act also the vital importance of a suitable design and construction for gaols as an aid to good prison management was recognised by the creation of the office of Surveyor-General of Prisons to advise in these matters.

Howard had advocated the complete separation of the sexes, and the confinement of each of them in a cell alone, and this was provided for in the Penitentiary Act, 1778. The practice was adopted in a few county prisons, and it was again enjoined together with daily divine service and the absolute separation of males from females in 3 Geo. IV. chaps. 65 and 83, but the expense of building these cells fortified a prejudice against the 'solitary' system, which was largely increased by the too thorough mode in which it had been carried out in America. A commission which was sent in 1834 to America to inquire into the matter, however, reported entirely in favour of prisoners in all gaols long as long as they remained in the hands of so many independent local authorities, by the great difficulties, amounting to impossibility, in getting some of the local authorities to provide proper prison buildings, and by the unnecessary costliness which resulted from the existence of so many small and independent prisons; for there were still no less than 113 of these establishments in England and Wales, 57 in Scotland, and 38 (besides 95 bridewells) in Ireland. The consolidation which has resulted from them has made a very large saving in the cost of pay- ments of prisoners in the several prisons in England and Wales, 15 in Scotland, and 22 in Ireland. In Scotland the geographical conditions have led to the adoption of a system of licensed cells under charge of the police, where prisoners under sentence not exceeding fourteen days may be retained. These are allowed in twenty-eight places to avoid the necessity of sending such prisoners long distances to serve a short sentence. The population of these little prisons is for the most part from one to two. In the years 1876-77, the last in which the prisons were under the local authorities, 8700 of these establishments were in England and Wales, more extensive of new buildings and interest on loans, &c., was £495,068; in 1880-90 it was £529,381; and it has since fallen still further. The diminution would have been larger but that in various prisons the service has been improved. In the Catholic prisons, in order to be spared and paid for their services; the clerical work formerly largely done by prisoners is performed by paid clerks; attention is more generally paid to the schoolboarding, and more money expended on schoolmasters. These acts have also ensured substantial uniformity of treatment throughout the United Kingdom, because all rules are now made by the Secretary of State or Lord-lieutenant of Ireland.

Prisoners before trial form a separate class in the prisons, and are now subjected to no more inconvenience than is necessary to ensure security and due order and discipline in the prisons and their own clothes and supply their own diet if they choose, have full opportunities of receiving visits from their friends and corresponding with them, and are not obliged to perform any unaccustomed or menial labour for themselves if they will pay for assistance.

Debtors also are kept apart from other prisoners. The rules made in the Prisons Act, 1865, with regard to this class of prisoner were not so far framed in view of the practice of imprisonment for debt which had not then been abolished by law. But the act successfully carried the principle which had been made possible to imprison only those debtors who refuse to pay when they have the means, and as this is a species of fraud they hardly deserve the consideration which, under the rules, is accorded to them. They are under no obligation to work, are allowed to lounge about in association, may provide their own clothing, bedding, and food, which may include wine and beer, and are allowed more frequent visits and letters from their friends than criminal prisoners.

The Prisons Act, 1865, also allowed the creation of a class of misdemeanants of the first division, who might be put in that class by the sentencing court; and the special sympathy accorded to sedition and seditious libel led to persons found guilty of these crimes being, by the law of 1877, secured in the privileges of this class. They are allowed a specially furnished room, and may provide their own clothing, bedding, and food, the services of an assistant to clean their rooms, and, on payment, full use of books, newspapers, &c., and certain privileges as to additional letters and visits at the discretion of the visiting committee. They are not considered criminals at all events. Doubts have sometimes been expressed whether the power of making a distinction of this sort in the punishment awarded to different offenders has been wisely exercised. It would recommend itself to most people that such an offender as a clergyman, who is imprisoned for not conforming to the rubric, should suffer less or no punishment beyond the deprivation of liberty, but a fraudulent bankrupt, or one who committed a criminal assault, or who incited others to crime and violence, is not necessarily a proper object for similar consideration on the ground of the character of prisoners in the class. Even crimes as grave as that of an ordinary typical criminal.

To pass from these special classes to the ordinary prisoners, the general rule is that after sentence every prisoner is permitted to raise himself progressively by industry, combined with good conduct, through four stages, in each of which he gains
some amelioration of his treatment. Commencing with penal or first-class hard labour—with sleeping on earls is laid from which there is no escape hard and with great restrictions as to books, letters, and visits—he gradually gains an improvement in each of these matters, and in each stage accumulates a small sum, larger in the higher stages than in the lower, which is either given him or laid out for his benefit out of a fund. When these punishments have, however, very largely diminished—a result of the system of progressive stages; for if ill-conducted or idle his progress into the higher stages is delayed, or he may be degraded into a lower stage after attaining to a higher. Considering the number of dietary punishments in 1877 (the last year before prisons were brought under the government) with the number in 1890, it is found that while the prison population has diminished by one-third, this form of punishment is less by one-half. Certain powers for the supervision of prison construction and expenditure are given to the governor, but corporal punishment or heavier sentences than he is empowered to award can only be inflicted by order of the magistrates who form the visiting committee of each prison, or by a commissioner. The various committees are appointed every year by quarter sessions, about twelve to each prison. Their duty is to visit the prison periodically, to hear any complaints of the prisoners, to deal with reports made of the misconduct of any prisoners, and to fulfil certain other functions more particularly the duties of the secretaries of State; but they have no authority over the officers. In fact, whereas up till 1878 the local authorities managed the prison, and the government inspected it, the position is now reversed, the government manages and the local justices inspect. A cardinal principle of the prison system is that every prisoner under sentence should be fully employed, but the description of employment varies in the different stages of the sentence. On first reception, and for a month at least, hard penal labour is enforced. Very few are employed to learn a trade, instead of being used as prison labour, according to their strength and capacity. The tread-wheel or crank is the typical form of this of first-class hard labour, as it is called; stone-breaking, oakum-picking, and some other forms of labour are enforced in the case of prisoners who are unfit for the tread-wheel. After this industrial labour is allowed, according to the capabilities of the prisoner, and forms a relief from the dull monotony of the first-class hard labour. A large proportion of the prisoners supply the wants of the prison population by weaving, tailoring, &c., and the list of trades followed or articles made in the prisons enumerated in the annual reports reaches to about 150; but, as may be imagined, there is a large number of prisoners who know of no industry which can be followed in a prison cell, and great industry is found in providing them with work, for they do not generally stop long enough to learn a trade to any good purpose. Mat-making and matting-weaving, which was, it is believed, introduced many years ago as a prison industry, is a trade which is very easily learned; but the same reason which recommends it for prison purposes makes it appropriate for many charitable institutions, such as blind schools, &c., and enables free persons who are incapacitated for other work to find employment at it. These latter are naturally anxious to diminish the competition of prison labour in their trade, though it forms now an exceedingly small part of that which they have to contend with, for the produce of machinery and imported and other foreign materials, besides the importation of rival materials to serve the same object, far exceeds the output from the labour of prisoners in this country. The number of prisoners employed in this industry has, however, by the efforts of the prison authorities, been diminished from nearly 8200 in 1874, which was the high-water mark, and because of the necessary conditions of prison labour, probably not more than that of one-fourth or one-fifth the same number of free labourers.

Every prison has its medical officer, and a well-regulated and well-constructed infirmary. The death-rate has decreased from 18 per 1000 to 8 per 1000 in prisons in England and Wales. The absence of all diseases due to insanitary conditions is the main reason of the healthy condition of the prisoners; and no doubt the strict temperance—for no alcoholic liquors form part of the dietary—and the regular life contribute to this result.

In order that the standard of efficiency may be maintained in all the prisons, and that opportunities may be given to both officers and prisoners to communicate any complaints they may have to make, reports from the district inspectors are made at least monthly, and to report to the commissioners on any point which may require their intervention. From the time when the prisons were taken over by the government in 1878 there has been a very large and almost uninterrupted diminution in the number of prisoners, who have been reduced by half due to any change of prison management, but there can be no doubt that this has had its share in the result, just as in former years bad prison management was a potent cause of the increase of crime.

The indication of the diminution of crime which is afforded by these prison statistics is fully corroborated by those which are derived from other sources. It is found that, during the fifteen years 1875-90, while the population has increased 25 per cent., the number of prisoners has decreased by about 12 per cent. In 1877 the total population was 23,465. In 1890 it was 19,677; and the decrease was all due to any change of prison management, but there can be no doubt that this has had its share in the result, just as in former years bad prison management was a potent cause of the increase of crime. Convictions for what is in ordinary language considered a crime—i.e. offences involving dishonesty, violence, &c.—increased in proportion with the population, has progressively diminished by about 12 per cent.; there were 283,000 convictions, summary and on indictment, for such crimes in 1873-74, and only 203,108 in 1887-88. Convictions for drunkenness are also much fewer—185,730 in 1873-74 and 166,306 in 1887-88; and if it were not for the increase in the number of commitments for offences against the education acts—for breach of bylaws and the like—the total number of commitments would have very largely diminished. The police reports show that the number of the criminal classes has diminished by about 62 per cent., and the number of disorderly houses has shown a corresponding diminution.

The design and construction of a prison is, as may be supposed, a feature of the very first importance. Security is of course one of the essentials, but there are others almost as important. In looking over old prisons one cannot but be struck with the massiveness of construction of many of them—the huge bars and bolts, the large clumsy locks, the ponderous grated doors, and, sometimes chained to the wall, the heavy fetters with which the prisoners were loaded. In the old

PRISONS 423
prisons

prison at York, built under the inspiration of the Rev. Sydney Smith, part of which still exists, security is provided for by making the walls of the cells of a rough stone, some 6 feet square and 2 or 3 feet thick, and grated windows of massive iron bars. In this modern construction the idea was intended to ensure the safe custody of the prisoners without constant personal watchfulness and supervision by the prison staff. All this is changed in the prisons of more recent date, but the security is even greater than before, because in a prison of modern construction the rooms are so made that it is impossible to isolate prisoners completely from each other. This construction has for some time been abandoned; it failed in its object, and in fact helped to prevent detection of an offender, while it was thought to diminish the influence of the minister and the effect of the service.

In connection with the offices is a library of selected books for issue to the prisoners, which is under the control of the chaplain. In some part of the cell block is a bath-house, where prisoners are required to wash themselves periodically; and in connection with the female side of the prison is a laundry for the washing of the prisoners’ clothing, sheets, &c., and in which also sometimes washing is done for people outside on payment. There are also workshops in which carpenters, smiths, &c., can work, and a foundry, where iron bars are cast for new gates. Large airy yards surround the blocks in which the prisoners live. In these they take their daily exercise under supervision of warders, pacing round and round a ring, separated by such an interval from each other as may prevent oral communication. Each yard contains of the dimensions of a large court, and is cultivated for vegetables for consumption by the prisoners.

Since 1869 a new feature has been developed in controlling the criminal class. By an act passed in that year and revised in 1871, the latter being called the Prevention of Crimes Act, any person convicted on indictment a second time may be subjected to ‘supervision’ by the police for seven years after the expiration of his sentence. During this period he is required to report himself to the police once a month, and to keep the errand of his residence; he is also required to prove his innocence if certain suspicious circumstances are brought against him. If he fails to comply with the obligation to report himself he may be imprisoned for a year with hard labour. The convict released conditionally before the termination of his sentence is under supervision or ‘probation’, and if there are reasonable grounds for believing that he is leading a criminal life, or showing himself unworthy of the freedom conditionally granted him, or if he should be actually convicted of crime, he may be returned to prison to undergo the whole of that part of his sentence which was remitted.

To aid in the work of detecting criminals an Habitual Criminal Register has been established, in which the names, descriptions, photographs, and criminal career of all persons who are proved to have been twice convicted on indictment are recorded. This register is printed and circulated to all police forces and prisons, and thus these authorities have at their command means of establishing the identification of any prisoner who comes into their custody, who is suspected to be an habitual criminal, and who may have been the subject of previous supervision or probation. The register contains information as to marks, or other remarkable personal peculiarities of those who have been registered, are classified and recorded.

It will readily be understood that it would not accord with the modern theory of punishment combined with reformation to turn any prisoner admitted at the prison gate on completing his sentence, to
seek for means of earning an honest livelihood with all the disadvantages which his connection and imprisonment obviously entail upon him. The first statutory recognition that it was right and expedient to make some provision for prisoners on discharge was in 32 Geo. III. chap. 45, by which justices might convey any such person by pass back to his parish; and at the opening of the chapter it declared a case for Mr. Michaelsec, the chaplain, the Rev. Samuel Glasse, pointed out that, the discipline and training of the prison having it might be hoped supplant the prisoners' habits of idleness and profligacy by habits of industry, the magistrates might be able to speak of them according to their merit or demerit to the parish officers. He observed, however, that this would not provide for the cases of Irish delinquents who had no settlement in the United Kingdom, but who were not few in number, as indeed they are not at this present day, when they furnish to British gaols an entirely disproportionate number of inmates. He thus showed the necessity for doing what in more recent times has been undertaken by societies for the aid of discharged prisoners. In 1823 the Gaol Act enabled a moderate sum of money to be paid for the benefit of discharged prisoners out of the returns of gratuities belonging to the gaol, in order that they might resort to any place of employment or honest occupation. In 1862 societies for the aid of discharged prisoners received statutory recognition, and the money awarded by the Gaol Act to the prison authorities, an amount not exceeding £2 per head, might be handed over to these societies for their benefit. This act was obviously a recognition of societies which already existed, but it afforded a great stimulus to the formation of others. The earliest of these societies is the list published by the Reformatory and Refuge Union, was the Hampshire Society, which dates from 1802; Dalston Female Refuge dates from 1803; the Sheriffs' Fund, which deals with City cases, from 1807. When the prisons were handed over to the government in 1878 there were about 50 discharging prisoners' aid societies acting in connection with the prisons, then 113 in number, and still numbering 66, even after the reduction which took place in the first two years.

The transfer of all prisons to the government in 1876 has had the most important effect in adding to the number of those societies. The Prisons Act had been passed partly to ensure uniformity of treatment of prisoners in all localities, and those who advocated the claims of the discharged prisoner were not slow to perceive that the same principle might be made to apply to the system of helping them to obtain honest employment on completion of their sentence; and, further, that the difficulty they had met with in inducing many of the local authorities to provide funds, or in raising private subscriptions, might be overcome, now that the government was responsible, because they were virtually bound to continue the grants which had been made by many local authorities, and could not refuse to make similar grants in places where the local authorities had hitherto failed to do so. In 1874—'The Prisons Act Union'—the Commissioners of Prisons took action with a view to securing the proper appropriation to this purpose of many charities and benefactions devoted in former times to the assistance of prisoners, but the exact objects of which were no longer applicable to existing circumstances. These funds were more or less within the cognisance of the Charity Commissioners, and some of the largest of them had already been diverted to objects quite disconnected from prisons or prisoners; but by means of an act passed in 1882 steps were taken by which most of these funds have been appropriated for the benefit of discharged prisoners through the agency of the above-named societies. The government makes to each society a grant each year proportioned to the number of prisoners to be relieved, in supplement of any of their charitable funds; but, as it is necessary to the object of the society and of its work that local aid and local interest should be excited in the work, it is essential that such aid should be a local one. For this purpose, the government has in each prison appointed a local committee, and in many, other organizations have more or less local connections. The grant is made on the principle that the sum should be at least equal in amount to the sum the government are prepared to allow. Besides the grant of money handed over directly to the society, the gratuity earned by a prisoner during his sentence may be paid him through the agency of the society, who thus have command over all the funds available for setting the prisoner out again in a fresh career, and can take care that it is not wasted in the indulgence to which a man or woman is naturally tempted on first release from the restraint and privation of prison life. The result of this government, this prominent position has there are now three societies in active operation in England, besides many homes and refuges chiefly devoted to helping women. There are nine discharged prisoners' aid societies in Scotland, and only three in Ireland. The result, of course, is that the statute statement of the results attained by these societies, but there can be no sort of doubt that they do admirable work. It is not, however, by any means those who spend most money who produce the best results. Money, no doubt, is an absolute necessity for the work, but the characteristic and important is personal care and interest in the person who has fallen into crime, perhaps from weakness of character, from bad bringing up, from misfortune, from evil connections, or whatever the cause may be, and who, after the experience of prison life and the disinterested aid has received, may desire to enter upon a new career.

United States.—In the early part of the 19th century the most advanced examples of prison discipline and construction were to be found in the United States, and although in the second half of the century this prominent position has no longer been maintained, the importance of the improvements initiated in America cannot be forgotten. Following closely on Howard's report, the 'Philadephia Society for Assisting Distressed Prisoners' was founded in 1770—the first of the kind in the world; and, though dissolved during the war, was reconstituted in 1787, and is still at work. Large measures of reform were quickly secured: by 1790 the principle of separation was recognised, and in 1794 all convicts were separated and sequestered; in the latter year, also, capital punishment was abolished in Pennsylvania for all crimes but murder in the first degree. It thus became necessary to devise some substitute for capital punishment. At the Eastern Penitentiary at Philadelphia, opened in 1829, the so-called Pennsylvania System of permanent seclusion of convicts was carried out; the evil effects arising from the rigorous application of this principle have been already referred to in this article, and even at Philadelphia the system is not now strictly enforced, whilst in all the other American prisons what is known as the 'Auburn System'—labor in association by day, and separation by night—has been adopted. In the southern states prisoners are leased out to the highest bidders for the term of their sentences; but this system, which confines the convicts to a slavery that is not modified even by considerations arising from personal ownership, is gradually being abandoned. The first place of detention for juvenile delinquents was opened at New York in 1825; the first reformatories on the cottage or family system were established in Ohio—for boys at Lancaster in 1838, for girls at Delaware in 1878.
In 1877 the Elminia (New York) Reformatory was opened, at which a new famous system has been adopted. It was opened to young men under thirty years of age; the principal features are indeterminate sentences, the classification of prisoners into three classes under the marks system, and discharge upon probationary parole, under supervision. The tasks are planned to avoid the evil effects of manual labour, and the plan has yielded good results, over four-fifths of the discharged inmates having been taught to lead useful lives.

A grave defect alleged by American critics is that in the county gaols and other places of detention for those awaiting trial all such prisoners are compelled to associate in a common hall, with all the evils which follow as a necessary result. It is said also that politics to a large extent determine the selection of prison officials, many of whom are appointed simply for services rendered to the party; and that the interference of labour organisations has had a considerable effect in the direction of putting a stop to contract labour—in New York, to labour of any kind—in the prisons. It may be added that crime has increased in the United States in a ratio far in advance of the growth of population; in 1830 the prisoners were 2,422; in 1850 they were 3,442 of the population; in 1880 they were 4,855. In a country where so many earnest and capable penologists are at work, however, there is every reason to hope for an ultimate return to better methods.

Pristina, a town of European Turkey, 59 miles by rail N. of Uskub. Pop. 8000.

Prists. See SAWFISH.

Privateer, a ship owned by a private individual, which, under government permission, expressed by a Letter of Marque (q.v.), makes war upon the shipping of a hostile power. To make war upon an enemy without this commission, or upon the shipping of a nation not specified in it, is piracy. Privateering was abolished by mutual agreement among European nations, except Spain, by the Declaration of Paris in 1856; but the United States of America refused to sign the treaty, and have not acknowledged the article Paris (q.v.). It is doubtful, however, how far that abolition would stand in a general war, for privateering is the natural resource of a nation whose regular navy is too weak to make head against the maritime power of the enemy, especially if they offer the protection of wealthy commerce. It was usual for the country on whose behalf the privateer was carried on war to take security for their duty respecting the rights of neutrals and allies, and their observing generally the law of nations. While not considered Pirates (q.v.) by the law, they were regarded as a class upon which little better during the great wars at the end of the 18th and the beginning of the 19th century, and as a rule received but scant mercy at the hands of the regular services. In the wars of 1793-1814 many English privateers were afloat. But in the same period no less than 18,871 English ships, with over 2,000,000,000 of prize-money were taken by the privateers of all nations. In 1849 privateer Surcouf took, in two months of 1807, prizes worth £259,250. At the American Revolution the new republic fully realised the advantage of its position in preying on the mercantile marine of Great Britain; and in the last decade of 18th and first quarter of 19th century, when ships were licenced at 7s. annually at the hands of American privateers, of which it was computed that some 250 were afloat. During the American civil war the Confederate cruisers were at first regarded in the north as mere pirates; and the Alabama Claims originated in the charge against the United States of the departure of the privateer Alabama, licenced from British ports. In 1870 Prussia made a decree in favour of creating a 'volunteer navy.' See ENEMY, NEUTRALITY, ALABAMA, BUCCANEERS, CORSAIR, PIRACY, PRIZE, Norman, The Corsairs of France (1887); Gomer Williams, The Liverpool Privateers (1897).

Privet (Ligustrum), a genus of plants of the natural order Oleaceae, containing a number of species of shrubs and small trees with opposite leaves, which are simple and entire at the margin; the flowers small, white, and in terminal panicles; the calyx slightly 4-toothed; the corolla funnel-shaped and white; the stamens are staminate; there is no tube beyond the tube of the corolla; the berries 2-celled. Common Privet (L. vulgare) is a shrub growing in bushy places and about the borders of woods in the middle and south of Europe, and in some parts of North America. It has half-evergreen, smooth, lanceolate leaves; and berries about the size of peas, black, rarely white, yellow, or green. The flowers have a strong and sweetish smell; the leaves are mildly astringent, and were formerly used in medicine. The berries, which hang on the shrub during winter, have a disagreeable taste, but serve as food for many kinds of birds; they are used for dyeing red, and, with various additions, green, blue, and black. A rose-coloured pigment obtained from them is used for colouring maps. The wood is hard, and is used by turners, and by shoemakers for making wooden pegs. Privet, although not spiny, is much used for hedges, often mixed with some spiny shrub, or with beech. It bears clipping well, and grows well in the smoke of towns, also under the shade of trees. A number of species of privet are natives of different parts of the East, and resemble those of these northern shrubberies in Britain. Most kinds of privet grow readily from cuttings, but some of the more ornamental kinds are increased by grafting them upon the common or other more vigorous species. It has now been proved that the shrub the white wax insect of China contains the wax on L. Jwovum. See WAX INSECT.

Privilege. For the privileges of council, see BARRISTER; for the privileges of parliament, see PARLIAMENT; for those of peers and ambassadors, see NOBILITY, AMBASSADOR; for privileged communications, see CONFIDENTIALITY, LIBEL, for the sacredness of the confessional, see CONFIDENTIALITY, LIBEL, see also AURIST, DEBT, SANCTUARY, SOVEREIGN.

Privy-council. Wherever a feudal system of government has prevailed it has been customary for the sovereign to summon, from time to time, a counsell of his barons or nobles to advise him in matters of state. This practice was adopted by the English monarchs as the means of enforcing from powerful feudatories an acknowledgment of their sovereign rights. The attendance of a baron at the court of his lord was a tacit admission of the suzerainty of the latter.
Under the early English kings the royal council was styled the Audo or Curia Regis. It consisted of the Chancellor, the Justiciary, the Lord Treasurer, the Lord Steward, the Chamberlain, the Earl Marshal, the Constable, and any other person the king might appoint; and two archbishops belonged to it as of right; and the Comptroller of the Household, the Chancellor of the Exchequer, the Judges, and the King’s Serjeants were occasionally present at its meetings. The authority of the curia was originally connected with the king, in that the persons of government, judicial and administrative, were united; but its constitution gradually underwent a complete change. In the first place, a distinction came to be drawn between the body of the curia—the magnam concilium—the permanent committee of the curia, which was constantly and closely attached to the person of the king. Then the two councils were themselves subdivided. The Court ad sacramento, or Court of Exchequer, which sprang from the magnam concilium, took cognisance of affairs of finance, then of actions affecting the revenue, and lastly of civil suits generally. The Courts of King’s Bench and Common Pleas—descended from the magnam concilium—respectively acquired their separate and independent character (q.v.) and were accomplished by the end of the reign of King John. They were merely successive delegations of the royal authority, and left the king’s prerogative as the fountain of law unaffected. In spite, therefore, of the establishment of regular tribunals, the sovereign still continued to exercise judicial authority, if not personally, at least through the agency of his chancellor and of the council, whose jurisdictions, afterwards so clearly distinguishable, were originally united. In the time of Edward III., however, the Chancery was rapidly becoming a separate tribunal; and by the end of the reign of his successor its establishment as the great court of equity had been effectuated. The concilium assiduum, also, had become a separate assembly of royal officials, bound by a particular oath and paid a regular stipend, to whose duty it was to advice the king in questions of law and equity and from the magnam concilium, and regarded with no little jealousy by them both.

From the accession of Richard II. to the end of the reign of Henry VI., the Privy-council were not merely the servants but the ministers of the crown, and acted as a check upon the royal authority. While in theory the king could choose and dismiss the members of the council at his pleasure, the exercise of this prerogative was in fact subject to various restrictions. Some of the officers of the state were members of the council ex officio. The two archbishops claimed to belong to it as of right. The presence of other ecclesiastics, with whom the papal was a higher authority than the royal, introduced a further element of independence, and the occasional efforts of parliament to wrest the appointment of the chief justices from the hands of the council disapproved. The English sovereigns endeavoured to defeat the operation of this check by the use of a privy-seal, and by retaining the Great Seal in their own hands. But the privy-seal passed into the custody of the crown, and by the middle of the 14th century the council had succeeded in bringing every royal grant under its own notice at each stage in the procedure necessary for obtaining it. In the time of Henry V., the council assumed the name of Privy-council, by which it is now generally known. Its functions were then partly administrative and partly judicial. The former included the control of matters of finance, the establishment of staples—i.e. markets in which alone certain commodities could be exposed for sale—the regulation of the statutes which limited freedom of commerce between different parts of England, and the preservation of the peace. The latter cannot be better defined than in the words of Mr Hume, who has written that ‘it is perhaps one of the most difficult matters of legal authority or from want of the right disposition to carry their decisions into effect, the law courts were likely to prove inefficient, then the council stepped in by summoning before it defendants and accusers.

In the third or modern period of its history, which commenced when the Wars of the Roses were drawing to a close, the character of the Privy-council has undergone a variety of changes. The destruction of the feudal system, and the overthrow of the old ecclesiastical supremacy, reduced it to a position of absolute dependency on the crown. At the same time the power of the council as regards the people was greatly increased (1) by the subjection of particular places to its control—e.g. Ireland under Poyning’s Act (1494), and the Channel Islands; (2) by the exercise of the right to issue patents; (3) to the extent of the law courts under its supervision—e.g. the High Commission and the Court of Requests; and (4) by the extension of its judicial authority in the Court of Star-chamber (q.v.). The judicial powers of the Privy council were, however, restricted by the law courts in the 17th and 18th centuries its functions as the adviser of the crown in matters of government and state policy were gradually usurped by the Cabinet (q.v.).

Present Constitution and Functions.—The list of privy-councillors now includes the members of the royal family, the Archbishops of Canterbury and York, the Bishop of London, the great officers of state, the Lord Chancellor, the Lord Chief-justice of England, the Lords Justices of the Court of Appeal, the President of the Probate, Divorce, and Admiralty Courts, the Lord Keeper, and the Vice-president of the Board of Trade, the Paymaster of the Forces, &c., and necessarily all the members of the cabinet. Members of the council are in their collective capacity styled ‘His [or Her] Majesty’s Most Honourable Privy-councillors;’ individually each member is styled ‘Right Honourable.’ (The Lord Mayor of London, although styled ‘Most Honourable’, is not a privy-councillor. See Notes and Queries, first series, i. 496; iv. 9, 28, 137, 157, 180, 236, 284; i. 137, 138.) Under the authority of letters patent granting 24 March, 1681, the privy-councillors take precedence after Knights of the Garter. Amongst themselves they take rank according to seniority of appointment when no other principle of classification is applicable to the individual councillor. The privilege of appointment to the sovereign without either patent or grant, and are subject to removal at his discretion. By the common law, the Privy-council, as deriving its whole authority from the sovereign, was dissolved ipso facto upon the demise of the crown; but the act of 13 Anne, chapter 4, made that of having no council in being at the accession of a new prince, it was enacted (6 Anne, chap. 7, sect. 8) that the Privy-council shall continue for six months after the demise of the
crown, unless sooner determined by the successor of the deceased sovereign (cf. Stephen, Comment. vol. ii. p. 491). It is now understood that no members attend the deliberations of council except those who are specially summoned. In ordinary cases only the ministers, the great officers of the House of Lords, and the Lord Chancellor are, except on extraordinary occasions, summoned to the whole council. (Thus, on November 23, 1839, the whole of the Privy-council were summoned to Buckingham Palace to receive the parliament's answer to specific questions intended in the bill of Pains and Penalties, with Prince Albert.) Meetings of council are usually held at intervals of three or four weeks at the sovereign's residence; and six privy-councillors at least, with one of the clerks of council, constitute a meeting of council.

A privy-councillor must be a natural-born subject of Great Britain. His duties are defined by the oath of office as follows: (1) to advise the king to the best of his cunning and discretion; (2) to advise for the king's honour and good of the public, without partiality through affection, love, need, doubt or desire; (3) to keep the king's counsel secret; (4) to keep the council's secrets, and strengthen the execution of what shall be resolved; (6) to withstand all persons who would attempt the contrary; and (7) to observe, keep, and do all that a good and true councillor ought to do to his sovereign; and from long tradition of a member of the Privy-council was formerly safeguarded by several statutes repealed by 9 Geo. IV. cap. 31. Immediately on the decease of the sovereign the Privy-council assembles and proclaims his successor, the Lord Chancellor affixing the Great Seal to the proclamations, and the Archbishops of Canterbury and York are then sworn as council of the new sovereign, after which a privy-council is held, and the sovereign makes declaration of his designs for the good government of the realm, and subscribes the oaths.

The functions of the Privy-council in modern times depend on a great variety of statutes, and it is only possible here to give a brief and very general survey of the whole field. The subject is one full of confusion, partly because of the vast mass of detail which it involves, and partly because the long historical development which the Privy-council has undergone has given it a natural crush of legal notions, anomalies, and contradictions. It will be convenient to divide our observations under four heads:

(1) The Privy-council as synonymous with the Executive Government.—It is a commonplace of constitutional law that the cabinet, which is the organ of the executive government, is quite unknown to the law. In theory the cabinet is only a committee or inner circle of the Privy-council, and the Privy-council is still the only instrument through which the sovereign can exercise his prerogative. But the theory never corresponds with the facts; the power is exercised by the cabinet alone, and the Privy-council is never consulted. This is the sense which must be attached to the statements that the 'sovereign in council' has while authority in the colonies, can make and enforce all laws, and that the cabinet operates as a repre- sentative assemblies, and can allow or disallow the legislative acts of such as do possess them. The case is the same with orders in council relating to blockades, reprisals, or embargoes. And, in harmony with these expressions, it is the regular course in acts of parliament conferring specific powers on the executive government to confer them in terms on the 'sovereign in council.' In such cases the mention of the council is purely formal, and if the power is exercised it will be by the ordinary government (cf. also 13 and 14 Vict. cap. 59, sect. 50). It may be added that, as the executive power is thus dependent on the authority of the legislature, so no executive act can be done, and no order in council can be made, which an act of parliament cannot override.

This is now a recognised mode in which the legislature delegates defined legislative functions to the executive department, and the example that the Board of Trade, for example, can make regulations for carrying out the provisions of an act of parliament, though the act may simply state, 'It shall be lawful for Her Majesty by order in council' from time to time to make such regulations.

(2) The Privy-council as the depositary of State.—As the au clo regia was the mother of the acts of parliament, and of the various courts of law, so the Privy-council has given being, in quite recent times, to several administrative bodies (such, for instance, as the Board of Trade and the Local Government Board), to which many of its own administrative powers have been transferred. The different stages or methods in this process of differentiation are curious. The Board of Trade, established on its present basis in 1782, was at first, and still is in name, a committee of the Privy-council; it is defined in the Interpretation Act 12, as 'the Lords of the Committee for the time being of the Privy-council, appointed for the consideration of matters relating to trade and foreign plantations. But for all practical purposes it is a distinct department of state, controlled by a president, who is a member of the government. The Board of Health, created 1848, was ten years later superseded partly by the Home Office, partly by the Privy-council. In 1871 the Local Government Board was created, in succession to the Poor-law Board and any it were transferred many duties formerly exercised by the council in relation to the public health, such, for example, as the appointment and control of public medical officers and the carrying out of the Vaccination Acts. In 1889 a new Board of Agriculture was established, and took over the powers of the Privy-council in connection with the De-structive Insects Act and the Contagious Diseases (Animals) Acts. Neither the Local Government Board, nor the Poor-law Board (which, created in 1847, ceased to exist, as we have already mentioned, in 1871), nor the Board of Agriculture are the original committee of a cabinet, but in each case a portion of the administrative functions of the council was transferred to the new department, and the historical connection is illustrated by the fact that in all these cases the Lord President of the council is named first in the list of ex officio members. The Committee of Council on Education, established in 1839, remains in a different position. It has not been completely detached from the Privy-council and erected into a distinct department of the administration; and the member of the government who represents it is not the President of the council. It is virtually called the Education Department, and its complete detachment would require little more than a change in the designation of its chief, and a clear delimitation of the power and responsibility of the Lord President of the Privy-council and the President of the Council. The Vice-president of the Council is already virtually minister for education.

In 1885 the Secretary for Scotland Act further transferred to the new secretary the powers and duties of the Privy-council in connection with the affairs of the public life of Scotland so far as Scotland is concerned. The Secretary for Scotland was also entrusted with control over Scottish education, under the title of Vice-president of the Scotch Education Department, which is still nominally a standing committee of the Privy-council.
With regard to the administrative business which remains with the Privy Council as a separate department of state it is commonly denoted upon a general principle that the work is actually done by permanent government officials, under the control of the Lord President of the Council, who is responsible to parliament and to the country. It is believed that this is accurately so, even when special committees are appointed by act of parliament for special administrative purposes. That the members of such committees are little more than advisers results naturally from the modern doctrine of ministerial responsibility. With this limitation, committees of the Council usually exercise the same judicial powers as are vested in the Council, and the Council has power to consider, and to settle a scheme for adjusting the rights and liabilities of the existing local authority. Under the Medical Acts the Privy Council is entrusted with the supervision of the qualifications and the registration of medical practitioners; and kindred powers are conferred by the Pharmacy Act, 1868, and the Veterinary Surgeons Act, 1881. A Committee of the Council exercised these powers under the Pharmacy Act (see Education). A Universities Committee of the Privy Council was constituted for England in 1877, and for Scotland in 1889 (see Universities).

The style under which administrative duties are exercised on the Privy Council varies. Sometimes it is referred to the Council, and occasionally a clause is added that 'all powers vested in the Privy-council by this act may be exercised by an order in council made by two or more of the Lords and others of H.M. Most Honorable Privy-council' (Veterinary Surgeons Act, 1881, sect. 18). Sometimes the duty is laid upon 'the Lords and others of H.M. Most Honourable Privy-council, or any three or more of them of whom the Lord President of the Council, or one of H.M. principal secretaries of state for the time being, shall always be one' (9 and 10 Vict. chap. 96).

(3) The Privy-council in its widest Comprehension.

—The Privy-council, as a body, has in modern times no regular duties at all, administrative or judicial. Membership of it is a coveted honour, conferring rank, precedence, and titular dignity. It cannot, however, be described as a central administrative body: it is mere service, consisting of a large number of different members, who, when in office, have no administrative duties to perform. It has disappeared as an administrative body, but it still remains as an advisory council, and its contents are determined by the necessities of the public service. The advisory council of the Privy-council consists of the Lord President of the Council, the Lord Chancellor, the Lords Justices, and other members of the Privy-council at large as shall hold or shall have held certain judicial or other offices enumerated in the acts. By 34 and 35 Vict. cap. 91 Queen Victoria was empowered by order in council to appoint by warrant under her sign-manual four additional
paid judges, each being, or having been, a judge of one of the superior courts at Westminster or chief-justice of Bengal, Madras, or Bombay, to act upon the judicial committee. Under the Appellate Jurisdiction Act 1876 (sect. 14), provision was made purporting to authorize "the ordinary of appeal" for the four paid judges appointed under 34 and 35 Vict. chap. 91, and thus for the ultimate merging of the judicial committee in the House of Lords.

The conditions of appeal from colonial courts to the Privy-council, as now prescribed, sometimes in the charters of justice constituting such courts, sometimes by colonial acts, usually by orders in council. The customary conditions are that the amount at stake should exceed a certain sum in value, that leave to appeal should be asked from the court below within a certain time after the date of the judgment appealed against, and that proper security should be found. It is, however, the inherent prerogative right, and on proper occasions the duty, of the King or Queen in council to exercise an appellate jurisdiction over all colonial courts and in all civil matters extraneous. In the exercise of this jurisdiction, and in the absence of any charter or statutory right, the Sovereign in council may grant special leave to appeal in civil cases of substantial, general, or constitutional importance, where the judgment appealed against was passed in a colonial court and is final. In the absence of a charter or statutory right, the Sovereign in council may make rules for the regulation of the appellate jurisdiction of the Privy-council. The Privy-council is an exception to the general rule that the ultimate jurisdiction of the courts of justice is vested in the courts of the United States; and it is a constitutional question whether the appeal lies from the Privy-council to the courts of the United States.

The decisions of the judicial committee are pronounced by one member of the committee only, and not, according to the usual practice in divisional courts, the court of appeal, and the House of Lords, by each of the presiding judges. The student of the Privy-council reports is unable, therefore, to tell whether or not their lordships are unanimous, and, if not, who constitute the majority.

The Lord President of the Council is the fourth great officer of state, and is appointed by letters-patent in the Great Seal. The office is very ancient, and was revived by Charles II. in favour of the Earl of Shaftesbury in 1672.

Scotland once had a Privy-council of its own, but it was merged in that of England by 6 Anne, chap. 6. There is a separate Privy-council for Ireland, which in 1891 consisted of fifty-eight members, who are sworn pursuant to a sign-manual warrant directed to the Lord-lieutenant.

See Dicey's Privy-council (1880; new ed. 1887); Hearn's Government of England (ed. 1887); Macpherson's Practice (1860; new ed. 1873); Macquenie's Appellate Jurisdiction of (see Privy-council (1842); Conditions of Appeal from the Colonies to the Privy-council (1888); G. Wheeler, Privy-council Law (1894).

---

**Prize. Prize-money.** Property captured from an enemy; but the term is generally applied exclusively to property taken at sea. As between the belligerent powers themselves the property in a ship or other thing captured passes at once by the mere capture to the captor. Up to the close of the Crimean war all property of an enemy even when carried in a neutral ship was liable to capture. The property was that of a neutral if captured on board a belligerent ship. This involved a claim to the right of searching neutral ships, a claim which Britain was only able to enforce during the great war with France in consequence of her mastery of the sea; it was a right, however, which was continually being disputed, and the enforcement of it in the case of American ships led repeatedly to difficulties with the United States. When the treaty of Paris was signed in 1856 it was universally agreed that private property in neutral bottoms so long as it is not contraband of war shall no longer be liable to capture (see NEUTRALITY, ENEMY, BLOCKADE). Army-prize-money is distributed according to the provisions of the Army Prize Act of 1832; a list of those entitled to share being sent to Chelsea Hospital, whose treasurer makes the distribution. In naval cases, a claim must be made to a prize belonging to the capturing power, where the Court of Admiralty, on full evidence, adjudicates whether she be lawful prize or not. If the decision be affirmative the prize is then sold; or, if a ship-of-war, a certain allowance is granted by the state. The produce of the sale or grant is lodged in the hands of the Accountant-general of the Navy, for distribution to the officers and men who assisted at the capture. The net produce of the sale or grant is first divided ratably among any ships (if there be more than one) concerned in the capture. If hundred members of a flag-officer, he receives one-thirtieth part of the whole; the commanding officer then receives one-tenth part of the remainder, or of the whole if no flag is present; or, if there is more than one ship present, one-tenth part is divided between the commanding officers. After provision has been made for the flag (if any) and for the portion of the commanding officer or officers, the remainder of the proceeds is so distributed that each officer, man, and boy shall receive shares or a share: commanders and officers of similar rank receive forty-five shares each; lieutenants and officers of similar rank, from forty shares to thirty according to seniority; sub-officers, petty officers, petty officers, ten shares; first-class petty officers, ten shares; second-class petty officers, seven shares; able seamen, four shares; ordinary seamen, two shares; and boys, one share each. Warburton's Prince Rupert (vol. iii.) gives an interesting distribution of prize-money in the 17th century.

**Prize-court.** See ADMIRALTY COURTS.

**Prize-fighting.** See PUGILISM.

**Prjevalski.** See Prjevalski.

**Proa** (Malay praku), sometimes known as the 'flying proa,' is a peculiarly shaped canoe in use by the natives of the Malay Archipelago, and on the China Seas, especially by the Ladrone Islanders. It is about 30 feet in length by 3 in width, and has the stem and stern equally sharp, so as to sail backward or forward with but little being turned round. One side is flat, and in a straight line with the stem and stern; the other side is rounded, as in ordinary boats. This peculiar formation would make it liable to easily upset, were it not for a framework which projects...
to windward, supporting a weight which balances the pressure of the wind on the sail. The sail resembles the ordinary lug-sail, and is formed of mat. Slight variations from this form are found, but the principle of construction is the same.

Probabilism. See Casuistry.

Probabilities, Chances, or the Theory of Averages. To assign a number which measures the probability of a future event may at first seem impossible; and yet the whole business of many large empires instituted in every civilized country for the ‘insurance’ or ‘assurance’ of lives, &c. is mainly based upon the methods of assigning such a number. When it is certain that a future event will take place, or will not take place, a fixed number is selected for each case to indicate that then either happen or fail, the sum of the two probabilities are the limits of our scale. Will the sun rise to-morrow morning in the east? Probability = 1, certainty in favour. Will full moon be seen to-morrow morning in the east? Probability = 0, certainty against. Between these two limiting numbers, and, in fact, is the probability (or fraction) which measures the probability of any undecided event. The number, then, by which we mark the chance, or expectation, or probability of anything occurring in the future, must be a fraction like \( \frac{1}{2} \), \( \frac{2}{3} \), \( \frac{4}{5} \), or 273, and can never be so large as 1, which was fixed as the higher limit, certainty; and by the fractional number assigned to any event we can readily compare its probability with those of other future occurrences.

To assign the proper fraction to any future event we will, in general, imply knowledge of a large number of similar events. Thus, in January, what is the probability that on next 12th April the sun will rise bright and unclouded? Relying on the constancy of nature and the doctrine of averages, we consult the calendars and weather-notices of the last 50 years, say, and find that in 17 of these the result was favourable and in 33 unfavourable. On these data the probability required is \( \frac{17}{50} \), rather over \( \frac{1}{2} \). In other words, the odds are nearly 2 to 1 against the event. The fraction \( \frac{17}{50} \) measures or shows the probability that the event will not happen. More generally, if an event may occur in 12 ways and fail in 15 ways, then the probability of its occurring is \( \frac{12}{27} \) and the probability of failure, \( \frac{15}{27} \). In such a case the 27 ways are supposed to have each the same chance of occurrence; and, since the event must either happen or fail, the sum of the two probabilities =certainty—i.e. \( \frac{12}{27} + \frac{15}{27} = 1 \). Thus, if \( \frac{12}{27} \) is the chance of an event, \( 1 - \frac{12}{27} \) = chance that it will not occur. In a certain town only 4 days of May—taking the average of many years—are rainless; what will be our chance of finding next 15th May rainless? Chance \( \frac{4}{29} \) = chance of rain falling. The principle involved in such simple solutions is the foundation of the mathematical treatment of chance or probability. Of all the occurrences, all equally possible, which relate to a future event, if \( a \) are favourable and \( z \) unfavourable, then \( p = \frac{a}{a + z} \), where \( \frac{a}{a + z} \) stands for probability of the event occurring. Sometimes it is easier to find the probability of the event failing, and subtract that result from 1 as in the examples just given.

Out of 100 sailors who mutinied there were 10 ringleaders. If 2 are selected by lottery for capital punishment, find the chance that both will be ringleaders. The total number of pairs is 100.99 and the number of pairs among the ringleaders is 10.9. Hence chance required = \( \frac{10.9}{100.99} \) = \( \frac{10}{100} \).

The number of the 9 coins is 6, 8, 7 or 84, which forms our denominator. Of the sovereigns there are 1.2 = 10 pairs, each of which may be drawn with one of the 4 shillings, giving 40 groups of 3, which forms our numerator. Hence chance required is \( \frac{6}{10} \) = \( \frac{3}{5} \); i.e. the odds are 11 to 10 against the event.

Sometimes actual trial seems to throw discredit on the mathematical measure of a chance. Thus, if a die be thrown, the chance of a 5 or any other number turning up must be \( \frac{1}{6} \) by our definition; whereas a person may cast a die, say 20 times in succession, with the result: 6 four times; 4 and 6 each 3 times; 2 and 3, each 5 times; 5 not at all. How then explain the mathematical estimate? Simply that 20 is much too small a number to take an average from, and the result 'chance = \( \frac{1}{6} \) for each side of the die' refers to the most general case and is not applicable for an indefinite number of throws. Register for 10,000 throws, then for 100,000 or 1,000,000, and the results would more and more approximate to the mathematical result, and prove that each side has chance = \( \frac{1}{6} \)—the die being of course a perfect cube.

An important extension of the theory is that the probability of two independent events both occurring is measured by the product of their separate probabilities. Thus, if A’s chance of passing a certain examination is \( \frac{1}{4} \) and B’s \( \frac{3}{4} \), then (1) the chance that both will pass is \( \frac{1}{4} \times \frac{3}{4} \), i.e. the odds are 7 to 5 against; (2) the chance that both will fail is \( (1 - \frac{1}{4}) \times (1 - \frac{3}{4}) \); (3) the chance that A passes and B fails is \( \frac{1}{4} \times \frac{1}{4} \); and (4) the chance that A fails and B passes is \( (1 - \frac{1}{4}) \times \frac{3}{4} \). By comparing these four results we see that the last event is the most probable of all, the odds being 25 to 24 in favour of it. Moreover, these results exhaust the possible alternatives of double event, therefore the four probabilities should together amount to certainty: \( \frac{1}{4} + \frac{3}{4} + \frac{3}{4} + \frac{1}{4} = 1 \).

By the same principle we solve many useful and curious problems. A town-council of 20, 12 Liberals and 8 Conservatives, have to choose a deputation of 5 by ballot; find the probability that it will contain 3 Liberals and 2 Conservatives. Total number of groups of 5 is 20.19.18.17.16 = 1.2.3.4.5. and 19.3.17.16, which forms our denominator. Number of groups of 3 from the Liberals is 12.11.10, or 2.11.10, and number of pairs of the Conservatives is 8.7 or 4.7; therefore multiplyings 2.11.10.4.7 = total number of groups of 5 which fulfill the conditions; and required probability is \( \frac{1}{2} \times \frac{3}{4} \times \frac{1}{2} \times \frac{3}{4} \times \frac{1}{2} \) in other words, the odds are 354 to 385 or more than 3 to 2 against the event.

When a person buys lottery tickets his chance of success is found as in our opening paragraphs, and if multiplied by the value of the money attainable the product is called his 'expectation.' In this connection may be noted an important distinction
between the moral and mathematical values of 'expectation,' owing to the assumption that in such speculations the loss of money paid for tickets is not to be regarded. If one man of moderate means risks £500 in order to gain £5 when the odds are 100 to 1 in his favour, and another risks £25 to gain £500 when the odds are 100 to 1 against, the speculation in the former case appears much more reckless and immoral than in the latter, although in both cases the stake is exactly equal to the expectation.

We now reach the most important of all the applications of the theory of probability, its use in the calculation of life insurances and annuities. During the early part of the 18th century the celebrated London mathematician De Moivre constructed a formula of great simplicity which is still available, although largely superseded by elaborate 'tables of mortality' which have since been compiled in all commercial countries. De Moivre's hypothesis, out of 86 children born at the same time dies every year until all are extinct. Thus, for a man 40 years old, 86 − 40 = 46, 46 years on an average are still before him and 45 others; and his chance of life is the average number between 0 and 46, i.e., $\frac{46}{2} = 23$. Generally a person's probability of life or expectation is $\frac{b}{a+b}$, where $b$ is the present age. Actuarial writers have found that this simple formula agrees with their official tables, except in the case of young children and aged persons. The tables are based upon long-continued observations of the mortality in the class of persons dealt with, and from them the theory of probability is easily applied in calculating annuities, reversionary payments, and other results.

For ascertaining the various life contingencies the Institute of Actuaries employ a table giving all the ages from 10 upwards, and, beginning with 100,000 persons alive at the age of 10, place opposite each succeeding age the number of survivors, till at 98 years none are left. At 40, survivors = 82,254; at 50, survivors = 72,726; therefore the chance that a man of 40 shall live to 50 is 72,726 ÷ 82,254 = .884. The Belgian tables give .832 for the same event in the case of a married man living in town; and if his wife is 30 years old her chance of surviving for ten years is .802. These data give the following calculation of the chances of the four double events occurring 10 years hence:

- Both alive = .832 x .802 = .671
- Both dead = (1 − .832) x (1 − .802) = .223
- Husband alive only = .832 x (1 − .802) = .115
- Wife alive only = (1 − .832) x .802 = .145

As we have seen already the sum of these four probabilities must = 1, which verifies the reckoning.

The chance of both these persons being alive is evidently more than $\frac{1}{2}$—i.e. the odds in favour are better than 7 to 3.

Some of the higher applications of the doctrine of probability are not at all known, and the integral calculus and are of interest only to experts. It is proved, for example, by integration and the theory of averages that the mean latitude of all places north of the equator is 32°704; and when four points in the circumference of any circle (radius $r$) are taken at random, the mean area of the quadrilateral so determined is $3r^2 \pi = 935.5$.

There are works on the subject by De Morgan (1837), Boole (1854), Todhunter (1865), Venn (1866), Whitworth (1886), and Froster (1887).

**Probange**, an instrument of various shape and material, for pushing obstructions down the esophagus of a choking animal. See Choking.

**Probate Court**, a court created in England in 1838, in lieu of the old Prerogative Courts, to exercise jurisdiction in matters touching the succession to personal estate. Since the Judicature Acts of 1873-75 the Probate Court is included in the Prerogative, Divorce, and Admiralty Division of the High Court of Justice. If a man at his death leaves a will, then it must be produced and verified so as to prove that it is an authentic will, duly executed and signed in presence of witnesses, and therefore that the right to the personal estate is vested in the executors named by the will. The will is proved in eausin form by depositing it in one of the registries of the court, by making affidavit of the amount of the property, and by paying the probate duty (varying from £1 per £50 to £2 per £100, according to the amount of the property). The executors receive a copy of the will, accompanied by a grant of administration; and this probate copy is usually shown to bankers, &c., when the executors lay claim to the property of the deceased. If the authenticity of the will is disputed it must be proved by witnesses in court. If there is no will the personal estate devolves on the next of kin and widow, if any; and it is necessary that an application be made to the court to appoint an administrator. This is called taking out administration, and the act of the court appointing administrators is called letters of administration. See Dixon on *Probate* (2d ed. 1889).

**Probationer**, one who is on probation; especially, in Scotland, a divinity student who, having completed his studies and performed the prescribed exercises, is licensed to preach by the presbytery, and is entitled to become a candidate for a pastoral charge.

**Proboscis Monkey** (*Nasalis larvatus*), a native of Borneo, one of the dog-like (Cynomorph) Catarinesse, nearly allied to the genus Semnopithecus. The nose is very long, especially in the old males, and is mobile and retracted like a proboscis. In the young monkeys it is short and blunt. There are bushy whiskers, which, with the long hair on the back of the head, encircle the neck. The colours—brown, red, yellow, and gray—are bright. The adult males are about 3 feet in height; the body is lank, and the tail is very long. In habit these animals are arboreal and gregarious.

**Probos**, MARCUS AURELIUS, emperor of Rome, was born at Sirmium, in Pannonia, early entered the army, and the great fortune to attract the favourable notice of the Emperor Valerian. His subsequent conduct justified his rapid promotion, for he greatly distinguished himself on the Danube, and in Africa, Egypt, Asia, Germany, and Gaul. By the Emperor Tacitus he was appointed governor
of the Asiatic possessions of Rome; and such was the zealous attachment evinced for him by his soldiers, that on March 19th, three days after, they forced him to assume the purple; and, his rival Florians having been removed, Probus was enthusiastically hailed emperor by all classes (276 A.D.). His brief reign was signalized by brilliant and important successes; the Germans were driven out of Gaul, and the Persians, from the Rhodian, Panonian, and Thracian frontiers; and Persia was forced to agree to a humiliating peace. The external security of the empire being established, Probus devoted himself to the development of its internal resources. But fearing that the discipline of the army would be deteriorated by inactivity, he employed the soldiers as labourers in executing various extensive and important works of public utility. Such occupations, considered as degrading by the soldiers, excited among them the utmost irritation and discontent; and a large body of troops engaged in draining the vast expanse of Sirmium murdered their excellent emperor in 282.

Processions, as solemn and religious rites, are of very great antiquity. With the Greeks and Romans they took place chiefly on the festivals of Diana, Bacchus, Ceres, and other deities; also before religious images of the God, as, for instance, the Circumcision, and in spring, when the fields were sprinkled with holy water, to increase their fertility. The priests went at their head, bearing images of the gods and goddesses to be propitiated, and started either from certain temples or from the Capitol. Among the Jews these processions were carried on in winter and still are at a certain extent—usual on the Feast of the Tabernacles; and from thence the Mohammedans have adopted their mode of encompassing the sanctuary seven times at Mecca. Processions also form a prominent part of the Buddhist worship. The practice was early introduced into the Christian church, but seems to have been adopted by Chrysostom at Constantinople to counteract the influence of the Arians processions through the streets to their churches outside the walls. As soon as images of them as ancient in his day. During the middle ages processions were arranged on a scale of great magnificence, as at the Corpus Christi Festival. Since the Reformation they have been much less elaborate, especially in mixed countries; but at Vienna, and still more at Munich, the Corpus Christi procession is still magnificent. Processions are either Suppliatory processions or Cross processions, and are either directed to a certain distant place, to some miraculous image or object, or they are confined to the streets of the cities and the churches. Banners, crosses, and images are generally carried in front; the clergy follow; and the people make up the rear, singing hymns or reciting prayers. Processions to beseech the special mercy of God are variously to be described as Litanies, Lamentations, Supplications, a. Exordia; and again, they are to be distinguished by being used with or without the Blessed Sacrament, relics, or images of the Virgin or Saints. Some are extraordinary and specially arranged; others are ordinary and fall under the common ritual, as those on Candlemas, Palm Sunday, St. Mark's Day, three Rogation days, and at funerals. The Processional is the service-book containing the prayers, hymns, and ceremonial of processions. There is no doubt that, whatever their general intrinsic value, they offer in many instances one of the most strikingly picturesque features of the Roman faith, and that they answer a certain instinctive craving of the multitude. Processions through the streets are frequent in modern life as political and social demonstrations, as during strikes and the like, and when not deemed dangerous to order or obstructive to traffic, are claimed as a privilege of free-born citizens; and they have been introduced to break the quiet of many English towns and villages as part of the traditional ceremonies of the Salvation Army. For extensive pilgrimages, see Pilgrim, Mecca, Festivals, &c.

Procehin Ani. See Infancy.

Procida, an islet of Italy, between the island of Ischia and the mainland (Cape Miseno), 50 miles W. by S. of Naples. Area, 1} sq. m.; pop. 18,131. On its shores is the city of the same name, with a harbour, a royal palace, a state-prison, and a marine school. The people fish coral, tunny, and sardines, and grow fruits, wine, and oil. The island was occupied by Britain on two or three occasions between 1799 and 1813.

Proclamation, a public notice given by the sovereign or governing power to the people. The power of the sovereign to proclaim a Habeas Corpus act and to proscribe the pro-revolutionary party is necessary in order to suppress the influence of royalty as the fountain of justice. They sometimes consist of an authoritative announcement of some matter of state, or act of the executive government affecting the duties and obligations of subjects. The demise of the crown, and accession of a new sovereign, such declarations of the government that the new coin is all occasions on which a royal proclamation is issued. In time of war, the crown by a proclamation may lay an embargo on shipping, and order the ports to be shut. But the most usual class of proclamations are admonitory notices for the prevention of offences. Such proclamations are declarations of existing laws and penalties, and of the intention to enforce them; such as the proclamation against vice and immorality, formerly read at the opening of courts of assize and quarter sessions in England. In Scotland proclamations summon the Scottish peers to elect representatives to the House of Lords.

Proclamations are binding when they enforce the execution of laws already in being. Towards the end of Henry VIII.'s reign it was enacted that the King's proclamation should be deemed an act of parliament; but this ill-judged law was repealed in the first year of Edward VI. It is now clear that the sovereign can neither make a new law, nor dispense with the existing law, unless by consent of parliament. A meeting which is proclaimed is not thereby rendered illegal; the proclamation is only a notice that, in the opinion of the government, the meeting is likely or certain to assume an illegal character. Proclamations are issued under the Great Seal, and are read aloud by heralds or other royal officers, in the three equal cities of the United Kingdom; the reading is preceded with the cry of 'O yes' (Fr. oyez, 'hear').

Proclus, the Neoplatonist, called the Successor (Diodococh), i.e. of Syrius, as the head of the Athenian school, was born in Constantinople about 411 A.D. He was of Lycean origin, and received his first instruction at Xanthus, in Lydia. He then studied at Alexandria under Arion, Leonaras, Hero, and especially under Heliodorus, with whom he applied himself chiefly to Aristotelian and Platonistic philosophy. From thence he went to Athens, where a certain Plutarch, a philosopher, and his rival, Socrates, met him and the latter, priest of Elenus, became his instructors, chiefly in theurgic mysteries. The vivid imagination and enthusiastic temperament which in his childhood already had led him to believe in apparitions of Minerva and Apollo, naturally convinced him, when all the influences of the mysteries were brought to bear 392
upon him, still more of his immediate and direct intercommunication with the gods; and he came to be—in the words of Procopius—that "the last and highest links in the ancient chain of the Heraclian sect, through which divine revelation reaches mankind." His soul had, he thought, once lived in Nicanor the Pythagorean, and, like him, he had the power to command the elements to a certain extent, to produce rain, and to temper the sun's heat. Of the Orphic Poems, the writings of Hermes, and all the mystical literature of that occult age were to him the only source of true philosophy, and he considered them all more or less in the light of divine revelations.

That same cosmopolitan spirit in religious matters which so characterized the period still had spirit in all the civilised pagan world of those days, and Procopius distinctly laid it down as an axiom that a true philosopher must also be a hierophant of the whole world. Acquainted with all the creeds and rites of the ancient pantheons of the different nations, he not only philosophised upon them in an allegorising and symbolising spirit, as many of his contemporaries did, but practised all the ceremonies, however hard and painful. Most especially was this the case in the severity of his fasting in honour of Egyptian deities—a practice which, it fitted him more and more for his hallucinations and dreams of divine intercourse, on the other hand more than once endangered his life. Of an impulsive piety, and eager to win disciples from Christianity itself, he made himself obnoxious to the Christian authorities in Athens, who, in accordance with the spirit of religious intolerance and fanaticism which then began to animate the new and successful religion against which Proclus waged constant war, banished him from this city. Allowed to return, he set out with somewhat more prudence and circumspection, and only allowed his most approved disciples to take part in the nightly assemblies in which he propounded his doctrines.

He died in 485, in his full vigour, and in the entire possession of all those mental powers, for which he was so celebrated, and so resembles to his personal beauty and strength.

As to his system, some modern philosophers have exalted it to an extent which his own writings scarcely warrant. Victor Cousin holds that he has concentrated in it all the philosophical rays which emanated from the great philosophers of the Greek world, such as Pythagoras, Plato, and Aristotle. The predominant law of development is triadic in character. The existence of what is produced in that which produces it, its emergence from it, and its return to it (μονή, πλούσιον, κτισμόν) are the three moments, by the continued repetition of which the totality of things is developed from their origin. The final source of this development is the original essence, elevated above all being and knowledge, between which and the intelligible there intervenes an intermediary member—the absolute unities (αὐτοτελή ἐντολά), together forming the five ultimate numbers, the basic elements on which he builds, the three spheres of the intelligible, the intellectual—intelligible (νοητά ἔθα καὶ νοημένα), and the intellectual. The chief property of the first is being; of the second, life; of the third, thought. Of these three parts, the first and second are again divided (3:2:1), the first into four triads, each of which is divided into two hemiologies, and each separate member regarded as a divinity. The soul is made of three kinds of parts—divine, demonic, and human. Of these the divine fall into three orders: the four triads of hegemonic gods, an equal number of gods free from the male, and the gods divided into four unities of the world, who are divided into stars-gods and elementary gods. The demons are divided into angels, demons proper, and heroes. The soul enters temporarily into the material body, but it does not create matter, which comes directly from the unlimited—without the limited and hence from the outside of the first intelligible triads. Space he considers as a body consisting of the finest light, which body penetrates that of the world. He distinguishes the principle of unity or divinity in the soul from thought or reason. It is capable by divine presence and illumination to manifest itself, to manifest the existence of God. Indeed, faith alone is essential to the attainment of Theurgy, which, comprising mental and supernatural inspiration, is preferable to all human wisdom; and in this Proclus chiefly differs from Plotinus, with whose system he agrees in most other respects.

There is no edition of the complete works of Proclus, but that of Victor Cousin (6 vols. 8vo, Paris, 1820) contains the Commentaries on the First Aeletheias and the Carmenides, and the treatises De Libraria, Procrustianst, et Malo (in a Latin translation); his second edition (1 vol. 4to, 1864) contains in addition to these the Homnms. Thomas Taylor, "The Platonists," published in 1788-89 translations of the Commentary on Evelius, with the life of Proclus by Nicomachus the Six Days, 1816; the Commentaries on the Timaeus in 1820; the Fragments on the Last Writings in 1825; On Providence, and On Evil, in 1833. The Commentaries in Plato's Dialogues, published by A. E. Taylor, 1833, is the one among his treatises that Proclus esteemed most highly. See Zeller's Philos. der Griechen (3d ed., 1881, ii. 2), and other books named under NEOPLATOMISM.

Procopius, a Roman magistrate not holding the consuls, who was invested with powers nearly approaching those of a consul, not, however, extending over the city and the camp. Procopius was, at first, one who had held the office of consul, whose imperium was prolonged to enable him to bring an unfinished campaign to a close. The duration of the office was a year. During the later period of the republic, when the consuls were expected to lead the army in the field, at Rome, they were generally appointed at its close to undertake, as consuls, either the conduct of a war in some province, or its peaceful administration. Occasionally the office of consul, with the government of a province, was conferred upon a man who had held the consuls. Under Constantine parts of certain dioceses came to be governed by consuls.

Procopius, ANDREW, the Hussite leader, was born in 1380. Originally a monk, he served under Ziska, and on Ziska's death became commander of the Taborites. It was under his command that the fearful raids into Silesia, Saxony, and Franconia were carried out (see HUSSITES), and he repeatedly defeated German armies. He and his colleague, Procop the Younger, headed the internal conflict of the Taborites with the more moderate Calixtines; and in the battle with the Bohemian nobles at Lipin, near Böhmenbruech, on the 30th May 1434, both the Taborite commanders fell.

Procopius, the most eminent of the Byzantine historians, was born at Cassarea, in Palestine, towards the close of the 5th century, and, having studied law, was taken by Belisarius in his train when he led the Roman armies against the Persians (526 n.c.), the Vandals in Africa (533), and the Ostrogoths of the east (536). His works displayed remarkable practical as well as literary talent, for he was on two occasions placed at the head of the commissariat. Returning to Constantinople shortly before 542, he was highly honoured by Justinian, and appointed prefect (if it was this Procopius who was in office). When Justinian died, he is thought, about three years later. Procopius's principal works are his Historiae in eight books (two on the Persian war, from 468 to 550; two on the war with the Vandals, from 532 to
546; and four on the Gothic war, going down to 552; De Adhesionis, or six books on the buildings executed or restored by Justinian; and Anekdoten, or Historia Arcana, a sort of chronicum scandalum of the Byzantines, in which he displays his usual acumen, error, his wife Theodora, Belisarins, his wife Antonina, and other distinguished persons, are depicted in the darkest colours. The most valuable of these productions is undoubtedly the first, in which Procopius writes with the clearness and fullness of knowledge that might be expected from a man who had been an eye-witness of much of what he narrates, and who had occupied a position that fitted him to thoroughly understand what he had seen. He is the principal authority for the reign of Justinian. The best edition of his complete works is that by Dimorfóte (1832-38). See Dahn, Proskopios von Kaisarea (1866); a work by Renan, Essais de Morale (3d ed. 1867); Haury, Procopianis (1891).

**Procrustes** (Gr. Prokroustis; from prokrouein, 'to beat out,' 'to stretch out'), the surname of a celebrated robber of Attica, named Damastes, or Polydamastes. He fell in love with a woman who lay on a bed which was either too long or too short for them, but to which he adjusted them either by racking or by amputation till they died. This he continued to do until Theseus overpowered him, and made him suffer the tortures he had inflicted on others.

**Procto**, BRYAN WALLER ("Barry Cornwall") was born in London, 21t November 1787. Educated at Harrow, with Byron and Peel for schoolfellows, he was articled to a solicitor at Calne, about 1807 came to London to live, and in 1815 began to contribute to poetry the Literary Gazette. In 1816 he succeeded by his father's death to about £500 a year, and in 1823 married Basil Montagu's stepdaughter, Anne Benson Skepper (1799-1888). He had meanwhile published four volumes of poems, and produced a tragedy at Covent Garden, whose success was largely due to the acting of Macready and Kemble. He was called to the bar in 1834, from 1832 to 1861 was a metropolitan commissioner of lunacy, and died 4th October 1874. His works, issued under the pseudonym "Barry Cornwall" (a faulty anagram of his real name), comprise Dorothea (1820), The Vicissitudes of Life, and Marcian Colonna (1821), The Flood of Thessaly (1823), and English Songs (1832), besides memoirs of Kean (1835) and Charles Lamb (1860). The last is always worth reading; but his poems may be safely neglected by the student of poetry, for they rarely are more than studied if graceful exercises, harmonious echoes of bygone and contemporary singers; in Mr Goss's words, 'his lyrics do not possess passion or real pathos or any very deep magic of melody, but he has written more songs that deserve the comparative praise of good than any other modern writer except Shelley and Tennyson.' Yet "Barry Cornwall" will be remembered as the man whom every one loved—that every one including a hundred of the greatest of the century: Lamb, Wordsworth, Coleridge, Leigh Hunt, Kenyon, Southey, Byron, Browning, Matthew Arnold, Swinburne, Hazlitt, Macaulay, Carlyle, Dickens, and Thackeray were only a few of his numberless friends and acquaintances. See Bryan Walter Proctor: an Autobiographical Fragment (1871), edited by G. Gayley. Palmore in an article therein the Edinburgh Review, April 1879, the critical introduction by Mr Goss in Ward's English Poets (2d ed. 1883); and a long obituary of Mrs Proctor in the Academy for 17th March 1888.

**Proctor**. Barry Cornwall's daughter, was born in London, 30th October 1825, and died there 3rd February 1864, having in 1851 become a Roman Catholic. By her Legends and Lyrics (1858-60), first written some of them for Household Words, she won no small poetical renown.

**Proctor**, or Procurator, one who acts for another. This name was formerly given to a class of practitioners in the English Admiralty and Ecclesiastical courts; but now is used for almost all purposes in the general body of solicitors. The King's or Queen's Proctor is an officer (now the Solicitor to the Treasury) who intervenes to oppose a petition for divorce if he has reason to suspect fraud or collusion. The clergy appoint proctors to represent them in the convocation of their province.

In each of the universities of Oxford and Cambridge there are two proctors, whose duties are to preserve the peace of the university, to repress disorders among the students, and inflict summary academical punishment. They have the command of the academical constabulary, and have also an extensive police jurisdiction in the town. They patrol the streets after dark, attended by officers popularly known as 'bull-dogs.' The proctors must be at term at Oxford and Cambridge, elected by the colleges according to a certain rotation. They nominate two pro-proctors to be their deputies and assistants. The summary authority of the proctors extends both to undergraduates and Bachelors of Arts. They vote in the election of some of the University officers, and in Durham also there are two proctors, who, however, do not personally patrol the streets, and have command over only the university police.

**Proctor**, RICHARD ANTHONY, astronomer and popular author, was born at Chelsea in March 1834. He was educated first at King's College, London, and then at St John's, Cambridge, where, however, he devoted himself chiefly to athletics. He graduated in 1860 as twenty-third wrangler. His first literary venture was, in 1865, an article on 'Double Stars' in the Cornhill Magazine, and from that time he devoted himself to astronomy. In 1866 he was elected an F.R.A.S., and in 1872 its honorary secretary, but he retired in 1873 to make a lecturing tour in America. About this time he communicated to the R.A.S. some important papers on The Construction of the Milky Way, 'The Transit of Venus,' 'Star Distribution,' &c.; and his name is associated with the accurate determination of the rotation of the planet Mars, and with the theory of the solar corona. One of his undertakings was the charting of the 324,198 stars contained in Argelander's great catalogue. His science magazine Knowledge was founded as a weekly in 1881, and became a monthly in 1885. He died at New York, September 12, 1888. He was a man of untiring energy, and, although the author of fifty-seven books, he found time to cultivate music, and was a great chess and whist player.

As an author and lecturer he succeeded in interesting in astronomy a large public in America and the colonies as well as in England. In 1890-91 a memorial teaching observatory was erected in his honour near San Diego, California.

Among his works are Surveys of its System (1865), Handbook of the Stars (1868), The Constellations (1867), Half-hours with the Telescope (1868), Other Worlds than Ours (1870), Star Atlas (1870), Light and Darkness for Language (1871), The Sun (1872), The Earth (1872), Orbs around Us (1872), Essays on Astronomy (1872), The Expanse of Heaven (1873), The Moon (1873), The Borderland of Science (1873), The Universe and the Container (1874), The Poor Place in the Universe (1874), Love and the Universe (1874), Mysteries of the Moon and Space (1875), The Sun (1876), Lunar and Solar Suns (1884), The Sun (1885), Other Suns than Ours (1887), Old and New Astronomy (nearly completed in MS. at his death, and published 1888-90).
Procurator-fiscal, a legal officer in Scotland at whose instance criminal proceedings are taken in the local and inferior courts. He is appointed by the sheriff with the approval of one of the principal members of the law, and is not removed from office except for inability or misbehaviour, on a report by the Lord President and the Lord Justice-clerk. His business is to take the initiative in the prosecution of crimes. There being no coroner's inquest in Scotland, he does the work which that functionary performs in England, where the inquiry into the cause of deaths occurring under circumstances of suspicion. Whenever he has reason to believe a crime has been committed his duty is to apply for a warrant to arrest the alleged criminal, to summon and precognosce witnesses, and to living the case to the grand jury for trial. If he finds there is no evidence, or from which he thinks was either not committed, or of which there is no evidence satisfactory, he gives his concurrence merely to the private party who suggests it, but does not himself initiate the proceeding. When the procurator-fiscal takes the precautions of the writs, he sends for the proper legal counsel, of whom the Lord Advocate is the chief; and if these counsel think the evidence is strong enough, and warrants more than suspicion, the prosecution is proceeded with to trial.

Professor, an officer in a university, college, or other seminary, whose duty it is to instruct students, or read lectures on particular branches of learning. In the early times of universities the deans presided over the seminaries to act as public teachers; and the terms Master, Doctor, and Professor were nearly identical in signification. As, however, the body of graduates ceased in the course of time to have any concern in public teaching, a separate class of recognized teachers sprang up, paid sometimes with salaries, in other instances by fees from private sources. These were called professors; and in the German and Scottish universities they became the governing body, and sole recognised functionaries for the purpose of education. In the universities in which collegiate foundations prevailed, as Oxford and Cambridge, they were the heads of the various seminaries or auxiliaries, attendance on their lectures not being generally deemed indispensable, and the necessary business of instruction being carried on by the functionaries of the several colleges. See UNIVERSITIES, and the articles on the several universities.

The word professor is occasionally used in a loose way to denote generally the teacher of any science or branch of learning, without any reference to a university. It has been assumed as a designation not only by instructors in music and dancing, but by conjurors, athletes, and the like.

Profit-sharing was defined in a resolution of the Paris International Congress on Profit-sharing in 1889 as 'a voluntary agreement under which the employed receive a share, fixed beforehand, in the profits of a business.' It is argued and held to be proved by those in favour of the system, that profit-sharing advances the prosperity of an establishment. This is done by improving its quality, by promoting greater care of implements and economy of material, and lessens the risk of strikes, labour disputes, and the antagonism generally between capital and labour. Upwards of fifty British firms with 11,000 employees had by 1890 adopted some method of profit-sharing. Over eighty-one industrial establishments in France, Alsace, and Switzerland are working on a somewhat similar principle. Upwards of twenty-nine firms in the United States have also tried the experiment. In some of the native banks at Shanghai, every employee was paid a certain per cent of the annual division of profits. Profit-sharing has been tried by firms of painters and decorators; paper, cotton, and woollen factories, &c.; and the famous Bon Marché in Paris. The additional fund thus coming to the workman may be paid to him directly in cash, or may be put to a beneficial use, or from a view of securing him a share in the capital of the firm, or it may be a deferred benefit for sickness and old age. The management of the business, as a rule, still remains in the hands of the capitalists.

Turgot in 1775 recognised a principle of profit-sharing, but Edme-Jean Leclaire (q.v.), a successful Parisian painter and decorator, was the first to carry it to a practical use. He began by paying extra wages to his workmen, bonuses were then given to a few, a provident society was established which was succeeded by a distribution of profits. Leclaire by wonderful energy and caution had risen to the front rank in his trade, and became a large employer of labour. For the benefit of his workmen he had established a mutual aid society in 1838, which he found to be 'a powerful means of moralisation and a living example.' Having therefore decided for his sick, as a master who had himself been a workman he remembered their hopeless condition when too old for work. He read everything he could lay his hands upon which tended to help him to improve the social condition of his workmen. M. Fréger in 1842, when making inquiries as to the condition of his workmen, suggested the participation of the workmen in the profits of the master as an expedient for doing away with the antagonism between capital and labour. There is evidence that M. Fréger did not afterwards believe in his plan himself at first rejected it, and it was much later, he says, 'through engulding my brains, that in 1842 the thing appeared to me possible and one of the simplest to put into practice.' He had endeavoured gradually to educate his workmen up to the same point 1842-47. He established a provident society and the sum received was in proportion to annual earnings. In 1869 a deed was drawn up which stipulated that the net profits of the business should be divided into a certain fixed proportion between the managing partners, mutual aid society, and the regular workmen. Between 1849 and 1872 the mutual aid society and his workmen had received £44,000; down to 1882 the sum had reached £133,045. In 1870 the number which participated was 758, the dividend to workmen being 24½ per cent. on annual wages; in 1882 the sum of £6530 was divided amongst 968 persons, 1884 the number was 824, the sum distributed being £2920, or about 24 per cent. on wages; in 1889 the amount was £1290. Five per cent. on the capital of 400,000 francs is, like the wages, deducted from the gross profits in order to find the net profits. Of the net profits 50 per cent. goes to the provident society, 25 per cent. to the mutual aid society, and a 25 per cent. to the provident society, which has now become half owner of the capital of the firm. The effect of all this on the workmen has been to make them sober, thrifty, and industrious. Other painters and decorators in Paris followed suit. When asked a philanthropist, the founder said: 'I am simply a business man. I would rather gain 100,000 francs
and give away 50,000 than gain 25,000 and keep the whole for myself.'

The Co-operative Paper Works, Angouleme, founded by M. Laroche-Joubert, adopted a system of Dolgeville. The dividend is payable in cash; provision is made for the admission of workmen shareholders, and by 1890 one-fourth of the shares were in their hands. The workmen have no part in the management. In the years 1879-88 the sum distributed over and above wages was £29,000.

In Messrs Godin's iron-foundry, Guise, employing about 1,000 hands, the workmen's share of profits accumulates towards the purchase of shares in the firm. The first method adopted was that of the bonus; then the system of benefit societies; and for many years payments in cash. In 1880 the sum paid in interest on workmen's capital was £29,000, and in wages £75,000; the number of workmen participating was 550; in 1889 the number was 961. M. Godin said that 'ever since the system was established the workmen are interested in improving the kinds of profit-sharing, which offset sources of loss and defect, and they exert themselves to make new suggestions.' Mr Lowry Whittle, in his report to the Board of Trade, says that out of a squad, ignorant peasantry M. Godin has moulded to a moral and commercial discipline of a regiment and the commercial alertness of the market-place. Since 1881 M. Flint, of the iron-foundries at Paris and Soissons, has distributed a portion of net profits. In M. de Courcy's plan 5 per cent. of the profits are set aside every year to form an endowment for every employee, after twelve months' service, has a claim in the proportion of his year's salary to the total amount of profits set aside.

But those who have tested any system of profit-sharing declare that it requires much time and pains to produce substantial results, and a difficulty in working the system is that profit-sharers are not infrequently unwilling to share the losses of the concern. In France there was founded in 1878 a society for facilitating the practical study of the different kinds of profit-sharing, which issues a quarterly Bulletin de la Participation aux Bénéfices. Both on the Continent and in America there have been experiments made in co-operative farming, fishing, market-gardening, and co-operative workshops. Alfred Dolge, of Dolgeville, a Saxon by birth, and the largest manufacturer of felt shoes and piano felt, &c., in the United States, has in operation a system of what he calls earning (not profit) sharing amongst his employees, which originated in the conviction that in the creation of wealth certain of the employees contribute a greater share than is represented by their wages, and are entitled to something more than the wages proper. These real earnings can be determined by book-keeping, irrespective of any market-rate of wages. He claims that it is the selfish interest of every employer, as a means of actual ultimate gain, to find out what the earnings of each of his workmen are. The main features of the Dolge scheme are: a pension scheme, insurance endowment, and various benevolences. (1) Under the pension scheme 21 per cent. of the earnings of 50, after ten years' service, in case of partial or total inability to work; is entitled to a pension at the rate of 50 per cent. of wages earned during the year preceding; rising to 100 per cent. after twenty-five years' service. The pension fund is paid from yearly contributions set aside by the firm on behalf of each workman, and in 1891 it was reported that it would soon be self-supporting. (2) Fifteen years of service entitles to three insurance policies of $1000 each : 75 policies of a

value of $138,000 were existing in 1891. Over $20,000 had been paid in premiums by the firm.

(3) The endowment money is the sum credited each year on account of more work done than has been paid for in wages and is payable after five years' service, and is payable at the age of 60 or at death. Mr Dolge, for the benefit of his workpeople, has given a park of 400 acres, assisted in building houses, maintains a club-house and free library, and pays $600 a year to the school society.

Progress and Labour disputes are reported as unknown at his factories.

In Great Britain any system of profit-sharing is not of such long standing as in France. The system adopted at the Whitwood Collieries of Messrs Briggs, Yorkshire, lasted beneficially from 1884 to 1876, when it ceased on account of the participation of the workmen in a strike against reduction of wages. During that time £34,000 had been distributed in percentage on wages. This percentage was paid when the net profits exceeded 10 per cent. on the capital embanked, one-half going to the workmen (Seal hemp) on proportion to earnings. Profit was also made for the work-people securing shares when the concern became a limited liability company.

The method of profit-sharing employed by many British firms has been derived from the French, which is generally adopted. 'From and after the 1st of September 18— the surplus (if any) of the clear profits of the business, beyond such definite sum as is for the time being reserved to the firm for their own benefit, shall be divided into two equal parts; one thereof to be distributed (not of legal right, but gratuitously) as a bonus to the employees in the manner defined by these rules, and the other to be retained by the firm.'

See Leroy-Beaulieu, Répartition des Richesses (1881); Hart's Maison Lecteur (1883); Taylor's Profit-sharing (1884); Wright's Profit-sharing (Boston, 1886); Doherty's Participation aux Bénéfices (1888); Gilman's Profit-sharing (1889), which contains a full bibliography; Bushill's Profit-sharing Scheme, with list of British profit-sharing firms; Die gerechte Verteilung des Geschäfliesrenten (1891); Lawson's Profit-sharing Precedents (1891); articles by Schliss in Contemporary Review for 1890; The Just Distribution of Earnings, an account of Dolge's scheme (1891); the report to the Board of Trade by Mr Lowry Whittle (1891); Bushill's Profit-sharing and the Labour Question (1892); and the articles Co-operation, Socialism.

Prog nosti c a u s. See Almanac, and Meteorology, Vol. VII. p. 155.

Progreso, the port of Merida, in Yucatan, from which it is 25 miles N. by two lines of railway. It stands on an open bay, exposed to every wind, and is one of the worst harbours in the world; but it has a very large export trade in beniique (Brown sugar).

Progression, in Arithmetic, is the succession, according to some fixed law, of one number after another. A series of numbers so succeeding one another is said to be 'in progression.' Progression may be of various kinds, but the three forms of most frequent occurrence are: (1) Geometrical Progression (q.v.), (2) Harmonical Progression (q.v.). If the terms of an arithmetical progression be inverted they form a series in harmonic progression; thus, 1, 2, 3, 4, 5, 6, &c. is an arithmetical progression; and 1, 4, 9, 16, 25, 36, &c. is a harmonic progression. This series is principally important in connection with the theory of music, in determining the length of the strings of instruments. See Harmonics.

Progression, Musical. The regular succession of chords or the movement of the parts of a
musical composition in harmony, where the key continues unchanged, is called Progression; where a new key is introduced it is not progression, but Modulation (q.v.).

**Prohibition.** See Liquor Laws, and Temperance.

**Projectile** is the name given to any mass thrown so as to describe a path in air near the earth's surface. The path described is called the trajectory. The importance of the subject springs from its close connection with Gunnery (q.v.). Any mass projected into the air is under the action of two forces: first, its weight, acting downwards when projected; second, the resistance of the air to motion through it, which resistance is a function of the speed, and depends also on the form, size, and mass of the projectile.

If we consider the action of gravity alone, the problem is a very simple one. Since the force of gravity is always vertical, there can be no change in the value of the horizontal component of the velocity. The projectile, projected from any point O (see fig. 1) at any inclination, will come to rest at the highest point A. At this point the vertical velocity will be zero; and, if the horizontal velocity were here suddenly reversed, the projectile would travel back along the same trajectory to O. As it is, the projectile proceeds along the path AO′, which must be exactly similar to AO. In short, the trajectory is symmetrical about the vertical line drawn through the highest point A. Reckoning from A, let us suppose the projectile to reach P after t seconds. Then, if the horizontal velocity is u, the distance of P from the vertical line AP = u′t. Let the projectile be thrown through the height AM at a velocity v; then v′ = u′/g is the horizontal speed, and the distance of P from the vertical line AP = v′t. The space fallen through, being measured by the product of the average speed and the time, is

\[ AM = \frac{2uv}{g} = \frac{2gMP}{v^2} = \frac{2gMP}{v^2} \]

The trajectory is therefore a Parabola (q.v.), with its axis vertical.

If we suppose the projectile to be projected with a velocity whose vertical and horizontal components are respectively u and v, then the angle of projection has its trigonometrical tangent equal to u/v. The time taken to reach the highest point is u/v; and the total range on the horizontal plane is

\[ O′O = 2OB = \frac{2uv}{g} \]

If we interchange u and v so that the tangent of the angle of projection becomes v/u, instead of u/v, we get still the same range. Generally, then, a given point, O′, can be reached by two trajectories with the same initial speed of projection. It is easy to show that the two corresponding directions of projection are equally inclined to the line that makes 45° with the horizontal; and the range is greater according as the components u and v of the given initial velocity are less unequal in magnitude. The greatest range is obtained when the angle of projection = v/g. Being the total velocity of projection, i.e., when the angle of projection is 45°, in this case the range is v^2/g. Thus, to throw a ball to a distance of 100 yards or 300 feet it is necessary to project it with a velocity of at least 100 feet per second (nearly). Practically, however, because of the atmospheric resistance, it would need a distinctly greater speed of projection than that just given to attain the desired range.

A very simple observation suffices to show that the parabolic trajectory is only approximately realised in air. A well-driven cricket or golf ball will be seen to be oscillating slightly as it proceeds, but second, the resistance of the air to motion through it, which resistance is a function of the speed, and depends also on the form, size, and mass of the projectile.

If we consider the action of gravity alone, the problem is a very simple one. Since the force of gravity is always vertical, there can be no change in the value of the horizontal component of the velocity. The projectile, projected from any point O (see fig. 1) at any inclination, will come to rest at the highest point A. At this point the vertical velocity will be zero; and, if the horizontal velocity were here suddenly reversed, the projectile would travel back along the same trajectory to O. As it is, the projectile proceeds along the path AO′, which must be exactly similar to AO. In short, the trajectory is symmetrical about the vertical line drawn through the highest point A. Reckoning from A, let us suppose the projectile to reach P after t seconds. Then, if the horizontal velocity is u, the distance of P from the vertical line AP = u′t. Let the projectile be thrown through the height AM at a velocity v; then v′ = u′/g is the horizontal speed, and the distance of P from the vertical line AP = v′t. The space fallen through, being measured by the product of the average speed and the time, is

\[ AM = \frac{2uv}{g} = \frac{2gMP}{v^2} = \frac{2gMP}{v^2} \]

The trajectory is therefore a Parabola (q.v.), with its axis vertical.

If we suppose the projectile to be projected with a velocity whose vertical and horizontal components are respectively u and v, then the angle of projection has its trigonometrical tangent equal to u/v. The time taken to reach the highest point is u/v; and the total range on the horizontal plane is

\[ O′O = 2OB = \frac{2uv}{g} \]

If we interchange u and v so that the tangent of the angle of projection becomes v/u, instead of u/v, we get still the same range. Generally, then, a given point, O′, can be reached by two trajectories with the same initial speed of projection. It is easy to show that the two corresponding directions of projection are equally inclined to the line that makes 45° with the horizontal; and the range is greater according as the components u and v of the given initial velocity are less unequal in magnitude. The greatest range is obtained when the angle of projection = v/g. Being the total velocity of projection, i.e., when the angle of projection is 45°, in this case the range is v^2/g. Thus, to throw a ball to a distance of 100 yards or 300 feet it is necessary to project it with a velocity of at least 100 feet per second (nearly). Practically, however, because of the atmospheric resistance, it would need a distinctly greater speed of projection than that just given to attain the desired range.

A very simple observation suffices to show that the parabolic trajectory is only approximately realised in air. A well-driven cricket or golf ball will be seen to be oscillating slightly as it proceeds, but second, the resistance of the air to motion through it, which resistance is a function of the speed, and depends also on the form, size, and mass of the projectile.
attain a velocity of 522 feet per second. If projected downward with a greater velocity it will be restrained, since the resistance due to the atmosphere is greater than the weight of the body. If projected upwards with a speed of 800 feet per second it will reach a height of only 5112 feet instead of nearly 10,000, and will return to earth again with a velocity of 500 feet per second. These results show that a meteoric stone never reaches the earth's surface with a velocity of more than a few hundred feet per second. It matters not with what relative speed the meteor may meet the earth. Once it gets into the atmosphere its kinetic energy is rapidly dissipated. The velocity being a product of the resistance volatilised at the high temperature that results. Our atmosphere, in fact, acts as a practically perfect shield to meteoric bombardment.

For projectiles discharged from firearms, see the articles on Bullet, Cannon, Cartridge, Firearms, Gun, Rifles, Shell, Shot.

Projection is the representation on any surface of objects or figures as they appear to the eye of an observer. It thus includes Perspective (q.v.), and is most simply illustrated by the shadow of an object thrown by a candle on a wall; the shadow being the projection and the place of the light the projection point. The theory of perspective is of great importance, both in mathematics and geography, being, in the former case, perfectly general in its application, while in the latter only the projection of the sphere is required. Projections of the sphere are of various kinds, depending upon the distance from the point of projection of the sphere, and the form of the surface on which the projection is thrown; thus we have the orthographic, stereographic, globular, conical, and cylindrical or Mercator's projections, all of which are treated of under the article MAP. Another projection frequently employed is the gnomonic. In the gnomonic projection the eye is supposed to be situated at the centre of the sphere, and the surface on which the projection is thrown is a plane surface which touches the sphere at any one point (called the principal point). It is evident that a map constructed on the gnomonic projection is sensibly correct only for a circular area whose circumference is at a small angular distance from the principal point. From the position of the eye in the gnomonic projection (which is not suited for representations of portions of the earth's surface) it follows that all great circles or portions of great circles of the sphere are represented by straight lines, for their planes pass through the eye. The gnomonic projection derives its name from its connection with the mode of describing a gnomon or Dial (q.v.). The gnomonic and stereographic projection of crystals is described and illustrated at Crystallography.

Prolapsus Ani is a common affection of the termination of the intestinal canal, and consists in an erosion of the lower portion of the rectum, and its protrusion through the anus. It may depend on a naturally relaxed condition of the parts, as in infancy, or may be caused by violent straining in cases of constiveness, piles, &c. Whenever it occurs the parts should be washed, and if possible replaced by careful pressure with the hand; and if they do not easily return the forefinger should be oiled and pushed up the rectum, and the patient should be very strict in his diet, with which the patient should retain the recumbent position for some hours. If it cannot be returned by the above means surgical assistance should be at once sought. In order to remove the tendency to prolapse, the patient will require frequent kinetic exercise to avoid constiveness, should sponge the parts after every evacuation with cold water or soap and water, and if necessary use astringent injections, as, for example, a weak solution of sulphate of iron, 1 grain to the ounce. In young children the power of straining, and therefore the tendency to the occurrence of the protrusion, may be much diminished by preventing their feet from resting on the ground during defaecation. Dr Druitt (in his Survey of the Course of Mephisto)—viz., that when the stools are passed the skin near the anus should be drawn to one side with the hand so as to tighten the orifice. If after the adoption of these means the bowel continues to descend certain surgical means must be resorted to, such as removal of the relaxed mucous membrane by the application of nitrate of silver or nitric acid, or removing a part of the loose skin surrounding the orifice, with or without portions of the mucous membrane as well.

Prolapsus Uteri. See Womb.

Proletaricide. a term used to denote the lowest and poorest classes of the community. It is derived, through the French, from the Latin proletariat, the name given in the census of Servius Tullius to the lowest of the centuries, who were so called to indicate that they were valuable to the state only as carriers of burdens (proles); hence the word has come much into use in the literature of Socialism (q.v.); see also Marx.

Prologue, a preface or introduction to a discourse or poem, as the prologue to Chaucer's Canterbury Tales; but more especially the discourse or poem spoken before a dramatic performance, corresponding to the Epilogue (q.v.) at its close. This usually stands outside the action of the piece, an external adjunct to it, being, indeed, a mere address to the public occasioned by the play. The introduction proper, again, belongs to the action itself, and this we find illustrated for us in the prologue of Euripides, spoken by one of the characters, in narrative form, half within and half without the action; in the separate induction of many old English plays; and in the preludes and prologues of modern dramas like Faust.

Prometheus, a great culture-hero of Greek mythology, the son of the Titan of Cóyney, brother of Atlas, Memnon, and Epimetheus. Hesiod tells his history as follows: Once, under the reign of Zeus, when men and gods were disputing with one another at Mecone as to which portions of the victims at sacrifices were to be given to the gods, Prometheus, seeing an ox, and placed on one side the best parts covered with offal, on the other the bones covered with fat. Zeus was asked to choose, but, finding the deceit practised upon him, avenged himself on the mortals by withholding from them the fire necessary for the cooking of the meat; whereas Prometheus stole it in a hollow fennel-stalk, and brought it to them. Zeus next caused Hephaestus to mould a virgin of wondrous beauty, Pandora (q.v.), whom Epimetheus was unwise enough to receive as a present from Hermes, and thus brought through her all imaginable ills upon humanity. Prometheus himself was chained to a rock, and an eagle sent to tear his liver by day, while Zeus caused it to grow anew during the night. At length Hercules killed the eagle, and by the permission of the goddess Minerva succeeded in rescuing Prometheus. Thus far Hesiod's legend. In the splendid tragedy of Aeschylus, the Prometheus Victus, Prometheus is an immortal god, a friend of the human race, who does not shrink from opposing the evil designs of Zeus against mankind, and even dares to meddle with the working of fate. He is the long-suffering hero, who, although overcome by Zeus's superior might, yet does not
bend his mind. He takes from man the evil gift of foreseeing the future, but gives him the two infinitely superior gifts of hope and of fire; and he is the inventor of architecture, astronomy, writing, figures, medicine, navigation, the mystery of prophecy, the arts of metal-working, and all other arts which embellish and adorn life. For these boons conferred on the human race he is by Zeus's own charter ranked to a rock in Scythia by Hephaestus, who fulfils this task reluctantly. Here he is visited by the Oceanides, by Io, and by Hermes, who endeavours to find out which of Prometheuses alone knows, who will be the readier son of Zeus and his consorts. Divine intelligence claims that he is struck by Zeus's lightning and hurled into Tartarus, whence he only re-issues after a time to undergo new sufferings. He is now fastened to Mount Caucasus, and the eagle, an offspring of Earth and Tartarus, comes to torment him daily. Chelion, the Centaur at last offers himself to supply the place of Prometheus in Hades—for on no other condition was he to be liberated than that some other immortal should offer himself in his stead. Chelion, incurably wounded by Heracles, is accepted by Zeus as a perpetual substitute for Prometheus.

The Greeks, divulg'd the myth, Epimetheus ('after-thought') is his opposite; and the beautifully ingenious identification of the solar mythologists with the Sanskrit Pramantha, the fire-stick of the Hindus, may be disregarded in the face of the existence of the myth far beyond the possible range of Aryan influence.

See the article Fire, p. 630; E. B. Tyler's Researches into the Early History of Mankind (1865), and Kuhn, Die Herkunft des Feuers (24 ed. 1886); older books on the myth by Welcke (1842) and Lasaulx (1843), and monographs by Helle (Berl. 1857) and Milchhöfer (Berl. 1882).

Promise. See CONTRACT, MARRIAGE.

Promissory-note, a written promise by one person (the payee) to another (the payor) or bearer of a sum of money either on demand or on a future day. It is in the following form:

£100.
London, 1st January 189—.

Three months after date I promise to pay Mr. William Smith or order One Hundred Pounds for value received.

John Brown.

With certain necessary exceptions, such as the rules regarding acceptance, the law of a Bill of Exchange prevails.

Promotion in the commissioned ranks of the British army, since the abolition of the purchase system in 1870, is obtained by seniority and by selection. On a midshipman passing all his examinations for the rank of lieutenant, he receives his commission as sub-lieutenant, and is then advanced to lieutenant, except in a few special cases, by seniority. Those specially selected for promotion have either obtained a first-class in all subjects of examination, or else have distinguished themselves on active service or other special service. Advancement from the lieutenants' to the commanders' list may be said to be by pure selection. As there are supposed to be 1000 lieutenants on the active list and only 250 commanders, it is inevitable that this should be the case. Except, however, for very distinguished service, lieutenants are not promoted before having served ten years in that rank, and the promotions are generally to be found among officers who have ten to fifteen years' seniority as lieutenants with a proportionate amount of service. Promotion from the lieutenants' to the commanders' list is also by selection; but there is this difference, that as the number of commanders is only some 70 in excess of the captains, any commander who puts in the requisite amount of sea-service can count, with a fair amount of probability, on being promoted. Captains and admirals are promoted on their respective lists by pure seniority; the three admirals of the fleet are selected for good service from admirals who have command of a squadron either as rear- or vice-admiral.

Promptorium Parvulorum, an English Latin dictionary, compiled c. 1440 by Geoffrey Chaucer, a friar-preacher at Lymn in Norfolk.

Prong-horn. See ANTELOPES.

Proof. See EVIDENCE; also ENGRAVING.
Proofs, Correction of. The corrections to be made on a 'proof' of printed matter are marked on the margin; and for this purpose an established set of signs or shorthand is used. The following specimen of a proof exhibits the application of most of these signs:

To rule the nations with imperial sway, to spare the humbled, and to crush the proud, resigning ito others to describe the courses of the heavens, and explain the rising stars; this, to use the words of the poet of the Aeneid in the apostrophe of Anchises to Fabius in the Shades, was regarded as the proper province of a Roman. The genius of the people was even more adverse to the cultivation of the physical sciences than that of the European Greeks, and [seen] we have that the latter left experimental philosophy chiefly in the hands of the Asian and African colonists. The elegant literature and metaphysical speculations of Athens, her histories, dramas, epics, and orations, had a numerous host of admirers in Italy, but a feeling of indifference was displayed to the practical science of Alexandria. [This repugnance of the Roman mind at home to mathematics and physics, extending from the Atlantic to the Indian Ocean, from Northern Britain to the cataracts of the Nile, annihilated in a measure all pure sciences in the conquered districts where they had been pursued, and prohibited attention to them in the mother country.]

Long, indeed, after the age of Ptolemy, the school in connection with which he flourished, remained in existence; &c.

(1) A wrong letter. After every mark of correction a line should be drawn, to prevent its being confounded with any other in the same line. (2) A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. (3) A space wanted. This mark is also used when the spacing is inconstant. (4) A space or quadrat sticking up. (5) Alteration of type. One line is drawn under the word for initials, two for small capitals, three for capitals. (6) Correction or insertion of stops. (7) A word struck out, and afterwards approved of (Lat. dec., 'thus marked'). (8) A typographical error. (9) An omission. (10) A letter of a wrong fount. (11) A word or letter to be deleted. (12) Alteration of type. (13) A new paragraph. (14) Insertion of a clausule. (15) A space to be removed or diminished. (16) A wrong word. (17) When letters or lines do not stand even. (18) Mark for a hyphen. (19) No new paragraph. (20) The manner in which the apostrophe, inverted commas, the star and other references, and superior or 'cock-up' letters and figures are marked.

The immediate object of a 'reader' or corrector of the press is to observe and mark every error and oversight of the compositor, with a view to make the proof as perfect a copy of the author's manuscript. This is on the supposition that the manuscript itself is quite correct, which is seldom the case; and therefore the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, &c., and in many cases to the correction of quotations, dates, and proper names. Where extensive alterations, omissions, or additions are likely to be made by writer or editor, it is more convenient to take the proofs on long slips, before division into pages. The striking of new paragraphs, or the suppression of those in type, should be avoided as causing trouble and expense.

The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and the weekly, taking in at the same time also to direct his attention to the numbering of the pages; to the arrangement of chapters, paragraphs, and notes; to running titles, &c. It is part of his business to observe the mechanical defects of the work—defective types, turned letters, inequalities of space between words, sentences, and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations, and such like. In almost all cases two proofs are taken, and in different works, such as those in foreign languages, titles, &c., even more. Lastly follows the proof reader, in whose hands it is his duty to see that the compositor has made all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second proof for himself.

The thankless and monotonous business of a corrector or reader is more difficult than the uninitiated would believe. It requires extensive and varied knowledge, accurate acquaintance with the art of typography, and, above all, a peculiar sharpness of eye, which, without losing the sense and comprehending the whole, can read at the same time each separate word and letter. See BOOK, PRINTING.

Propaganda (Lat. De Propaganda Fide), the name of a Congregation (q.v.), and also of a College, in Rome, the object of which is to direct and forward the propagation of the Catholic religion, especially amongst the heathen, and to conduct the dissenters from the Roman Church are also included in the sphere of its operations. The institution was originated by Pope Gregory XIII. (1572-84); but it was fully organised by Gregory XV., who in 1622 established a special Congregation for the purpose. This his successor, Urban VIII., extended and endowed, annexed a college for the education of missionaries to the several countries. One great feature of that college has been to provide for each new nationate of the several countries, although Church and state, at Rome, an establishment for the purpose of being specially educated in all the necessary learning of a missionary. This Congregation conducts the affairs not only of the missionary countries properly so called, but also of those in which the hierarchical organisation is not fully established. The College of the Propaganda is a noble institution, with some 200 pupils of all countries, tongues, and complexions, who are not only maintained and educated gratuitously from a very early age, but are equipped and sent forward to their several destinies at the charge of the institution. It possesses a valuable library (30,000 vols.) and museum, and a polyglot printing-press. Its great festival is the Epiphany of our Lord—His 'manifestation to the Gentiles;' and this feast is celebrated by an exhibition of exceeding interest.
and curiosity, at which are delivered recitations in every language represented in the College, and its missions, amounting often to fifty or sixty. Of this festival Cardinal Mezzofanti (q.v.) used to be the guiding spirit.

**Properius, Sextus** (for the second family-name, Aurelius, often given him there is no authority), the most impasioned of the Roman elegiac poets, was a younger contemporary of Tibullus, born about 48 B.C. in Umbria, probably at Assisiun (the modern Assisi). Nearly all we know of him is gleaned from his writings, according to which he became of an undistinguished, comparatively poor family, lost his father in boyhood, and had a position as a tutor to Timotheus, later Philipus, by the Triumvirs, to reward their veterans, but retained means enough to proceed to Rome for education, and, having chosen his residence, like Virgil and Maccenas, on the Esquiline, to make poetry the business of his life. The school then fashionable was the Alexandrian, represented by Callimachus and Philetas, and these he made his models, drawing from them his learned tone and his wealth of mythological colouring. In the political and martial movements of the time he took no part, though his patriotism was pure and strong. Exultation over the victory of Actium, his scorn of Cleopatra and her presumptuous ambition to dominate the mistress of the world, above all, his appeal to the Romans to renounce self-indulgence and to return to their neglected legends for the civic virtues and the heroism of 'the brave days of old,' Such was his precept; while his practice was the emotional poetic life, in the congenial society of Ovid, Virgil (whose *Hercules* he has nobly eulogised), the epic poet Pontius, and Julius Bassus. Like them he won the favour of Maccenas, to whom he dedicated a book of his poems, and even impressed himself with Augustus, whose achievements he duly celebrated. But the central figure of his inspiration was his mistress Cynthia, a lady somewhat older than he, whose real name was Hostin. For many years he cherished a glowing passion for this highly gifted, but far from virtuous him, till about 24 B.C. he disentangled himself from her. She died before him; but even after death she lived in his memory as she still lives in the poems that have immortalised her. Properius left Rome, it would appear, only once, on a visit to Athens. It is believed by some that he was shipwrecked, which is a vividly described. The year of his death has, with probability, been placed about 14 B.C. Of his poems only the first book, devoted entirely to Cynthia, was published during his lifetime; certainly the last of the four was given to the light, in terms of his will, by his friends. Its contents are youthful pieces, in which he celebrates the legends of early Rome in the style of Callimachus, and have a special interest in having most likely inspired Ovid to the composition of his *Fasti*—perhaps even of his *Heroides.* As a poet Properius is inferior to his Alexandrian contemporaries—the tone of the latter criticism with Goethe at its head—being one of increasing admiration for his native force, his eye for dramatic situation, his power over the reader's sympathies, giving the effect of reality to what in the hands of Tibullus or even Ovid degenerates into the mere expression of his own moods. His love is common with Catullus than with either of these, while he lacks the artistic graces peculiar to the three, being often rough to harshness and obscure from defect of finish.

For the English student there is an admirable translation by Palgrave (Bohn's Classical Library) and translations by Palgrave and Postgate in their respective editions. There is no adequate translation of him in any language, Cranston's, in English (1875), being about the most faithful.

**Property.** See Heritable and Movable, Land Laws, Personality, Possession, Real. **Prophecy.** For the doctrine of prophecy and its relation to prediction, see Bible, Vol. II. p. 110. See also the works of prophets cited at the articles Isaiah, Jeremiah, &c.; the works on prophecy by Hofmann, Delitzsch, Tholuck, Ewald, Kuenen, Reuss; Fairburn, *Prophecy* (1856; 2d ed. 1864); Stanley, *Greek and Roman Prophecy* (1888); W. R. Smith, *The Prophets of Israel* (1852); Riehn, *Messianic Prophecy* (Eng. trans. 1891). **Propolls.** See Bk, Vol. II. p. 21. **Proportion, in Arithmetic and Geometry, is a particular species of relation subsisting between groups of numbers or quantities. Notwithstanding that the idea of proportion is found to exist in perfection in the mind of every one, yet a good definition of it is a matter of extreme difficulty. The two definitions which, on the whole, are found to be least objectionable are that of Euclid and the ordinary arithmetical definition. The latter states proportion to be the 'equality of ratios,' and throws us back on a definition of the term ratio, which, most authors, would be considered the relation of two numbers to each other, shown by a division of the one by the other. Thus, the ratio of 12 to 3, expressed by 12 or 4, denotes that 12 contains 4 times; and the ratio of 8 to 2 being also 4, we have from our definition a statement that the four numbers, 12, 3, 8, and 2, are in proportion, or, as it is commonly expressed, 12 bears to 3 the same ratio that 8 does to 2, or 12:3::8:2. In the same way it is shown that 3:8::15:36; for 4 expresses the ratio of the first to the second, and 3/12 = 3/36 = 1/12. It will be gathered from the two arithmetical proportions here given, and from any others that can be formed, that the product of the first and last terms (the extremes) is equal to the product of the second and third terms (the means); and upon this property of proportional numbers directly depends the arithmetical rule called 'proportion.' &c. The object of this rule is to find a fourth proportional to three given numbers—i.e. a number to which the third bears the same ratio that the first does to the second; and the number is at once found by multiplying together the second and third terms, and dividing this product by the given first. It is illustrated arithmetically by such problems as, 'If four yards cost six shillings, what will ten cost?' Here, 15 being the fourth proportional to 4, 6, and 10, fifteen shillings is the answer. The distinction of proportion into direct and inverse is not only quite unnecessary, but highly misleading, as it tends to create the idea that it is possible for more than one kind of proportion to subsist. continued proportion indicates a property of every three consecutive or equidistant terms in a 'Geometrical Progression' (q.v.) for instance in the series 2, 4, 8, 16, 32, the first, 2, 4, 8, 16, 32, &c. and 2:8::8:32, &c. In the above remarks all consideration of incommensurable quantities has been omitted. The definition given by Euclid is as follows: Four magnitudes are proportional when, and only when, the multiples taken of the first and third, and any whatever of the second and fourth, according as the multiple of the first is greater, equal to, or less than that of the second, the multiple of the third is also greater, equal to, or less than that of the fourth; i.e. A, B, C, D are proportional, if, if mA is greater than nD; if mA is equal to nB, mC is equal to nD; if mA is less than nB, mC is less than nD; if mA is equal to nB, mC is equal to nD; if mA is less than nB, mC is less than nD; m and n being any multiples whatsoever. The apparent cumbrousness and circum-
PROTEUS

PROTECTIVE LEGISLATION

Simon N. Patten (1890); Our Sheep and the Tariff, by the present writer (1891); Geo. B. Curtiss, Protection and Prosperity (1896).

With the above article, by an American protectionist, Mr WM. Draper Lewis, should be compared the article Free Trade, in Vol. IV., by Professor Shield Nicholson, written from the opposite point of view.

Protective Legislation, a term applicable to legislation in promotion of Protection as opposed to Free Trade, is more specially used of legislation in favour of certain communities, or of particular businesses, to cut specially to stand in need of it, the Factory Acts (q.v.) being a notable example. To the same category belong the Employer’s Liability Act (see LIABILITY), the Merchant Shipping Acts, much of the legislation in regard to mines, Crofters (q.v.), and Irish tenants (see LAND LAWS). The supporters of the Laissez-faire (q.v.) theory of government, even when admitting justification for some of those measures, protest against others of them or parts of them as interfering with industry and commerce, and tending to limit freedom and establish a socialistic state despotism. The general idea to limit the working day to eight hours is resisted on the same ground; and some extend their protest to free education, free libraries, and government measures for the housing of the poor. See A Plea for Liberty, by Thomas Mackay, with preface by Herbert Spener (1891).

Protector, a title which has sometimes been conferred in England on the regent or governor of the kingdom during the sovereign’s minority. It was given to Humphrey, Duke of Gloucester, in 1422, in the minority of Henry VI. Richard, Duke of Gloucester, was Protector in 1483, prior to his ascension to the throne. Richard III. The Duke of Somerset, one of King Henry VIII.’s eighteen executors, was in 1547 constituted Protector during the minority of Edward VI., with the assistance of a council, consisting of the remaining seventeen executors; a dignity, however, which he enjoyed for but two months. Oliver Cromwell, in December 1653, took the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland. In 1658 his son Richard succeeded to his title and authority, but was never formally installed in the Protectorate, which he resigned in the following year.

Protocols are an essential class of substances, mostly of animal origin, but occurring also in the vegetable kingdom, of which egg albumen may be taken as a good example. The various members of the class are closely related to each other, and amongst them they make up the greater portion of the animal organism. The classification of the proteins is given in the article Animal Chemistry (q.v.). The most careful analyses of the various proteins show that they all closely approximate to the same ultimate composition, and contain about 33.5 per cent. of carbon, 7 of hydrogen, 15.5 of nitrogen, and from 3 to 10 of sulphur. The majority of the proteins exist in two modifications, the one soluble and the other insoluble in water. The latter modification can be obtained from the former by the addition of alcohol or ether, or of many mineral acids or metallic salts. Some of the proteins are obtained, when heated with a solution of mercuric nitrate containing a little nitrous acid, they assume a violet-red colour; and when the solution of a protein substance in acetic acid is mixed with strong sulphuric acid, a violet-

coloured solution is obtained, which in the spectrum shows characteristic absorption bands.

By the action of the gastric juice, of pepsin and dilute hydrochloric acid, and of several other ferments, the proteids are eventually converted into peptones. The latter are soluble in water, and are not coagulated by heating. See ALBUMEN, CASEIN, FIBRIN, and GLOBULINS.

Proteles. See AARD-WOLF.

Proterosaurus (Gr. proteros, ‘first,’ sauros, ‘reptile’), a genus of fossil reptiles occurring in the Permian system, which is the lowest horizon at which reptilian remains have as yet been detected. It is of a primitive type, and belongs to a highly generalised group of reptiles. The skull is imperfectly known, but the teeth appear to have been ankylosed to the bone, and not implanted in distinct sockets, as was at one time supposed.

Protestantenverein, an association of Protestant ministers, professors, and others belonging to the ‘liberal’ or advanced school of theology in Germany, formed in 1863 to promote what its members insisted was the spirit of the Protestant freedoms, and in opposition to what they regarded as reactionary and obscurantist. By the orthodox and conservatives the association was denounced as rationalist or infidel; and though since 1867 it has held annual meetings at towns throughout Germany, and has several organs in the press of the Fatherland (including the Protestantische Kirchenzeitung and a Jahrbuch), it and its members have been treated with marked disfavor by the ecclesiastical authorities, membership in the association being, it is alleged, practically a bar to appointments or preferments. See Schenkel, Der Deutsche Protestantenverein (new ed. 1871).

Protestantism, a term derived from the part taken by the adherents of Luther in protesting against the decrees passed by the Catholic states at the second diet of Spires or Speier in 1529. This decree had forbidden any further innovations in religion, and enjoined those states that had adopted the Reformation so far to retrace their steps as to reintroduce the Mass and order their ministers to avoid disputed questions, and to use and explain the Scriptures only as they had hitherto been used and explained in the Church. This was done by a considerable section of the Anglican Church. See CHURCH HISTORY, LUTHER, REFORMATION.

Proteus, in the Homerian or oldest Greek mythology, appears as a prophetic ‘old man of the sea’ (háthos géron), who tends the sail-flocks of Poseidon (Neptune), and has the gift of endless transformation. His favourite residence, according to Homer, is the island of Pharis, off the mouth of the Nile; but according to Virgil, the island of Carpathos (now Skárpmato), between Crete and Rhodes. Here he rises at mid-day from the floods, and sleeps in the shadow of the rocky shores, surrounded by the Cari, or men and monsters of the sea. It is the time when those who wished to make him prophesy must catch him. But it was no easy task. Proteus, unlike most vaticinal personages, was very unwilling to prophesy, and tried to escape by adopting all manner of shapes and disguises. When he found his endeavours hopeless he assumed his proper form, and then spoke out unerringly about the future.

Proteus, a genus of tail amphibia with persistent gills, represented by two or three species in the caves of Carinola and Dalmatia. They are tank animals, living in the dark for length; and with their peculiar habitat may be considered the pale colour of the flesh, and the embryonic state of the eyes, which are hidden beneath the surface. It has been shown, however, that sensitiveness to
PROTEVANGELIUM

Athenians, they natural vegetable is in the '5o workmanship. glutinous, sometimes associated PROTOPLASM

Protococcus (Gr., 'first-grain'), a genus of very simple unicellular green plants, one species of which (P. urceolus) is everywhere abundant as a green film on tree-trunks and damp walls, or in stagnant rain-water. The colour is sometimes reddish, and the organism may be found passively encysted during drought, and at other times actively motile with a couple of cilia. See ALOE.

Protococcus (Gr., 'first-grain'), a genus of very simple unicellular green plants, one species of which (P. urceolus) is everywhere abundant as a green film on tree-trunks and damp walls, or in stagnant rain-water. The colour is sometimes reddish, and the organism may be found passively encysted during drought, and at other times actively motile with a couple of cilia. See ALOE.

Protocol (Gr. protos, 'first,' and cola, 'glue'), [1] the rough draft of an instrument or transaction, and more particularly the original copy of a government despatch, treaty, or other document; [2] a record or register.

Protoplasma (Gr., 'first-born'), a granite rock, composed of the same ingredients as true granite, but the mica is more or less altered so as to resemble talc, while the feldspar is not formed. It received its name because it was supposed to have been the first-formed granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china. Protoplasma is now recognised to be simply altered granite.

Protoplasma (Gr., 'first-born'), a granite rock, composed of the same ingredients as true granite, but the mica is more or less altered so as to resemble talc, while the feldspar is not formed. It received its name because it was supposed to have been the first-formed granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china. Protoplasma is now recognised to be simply altered granite.

Protogen (Gr., 'first-born'), a granite rock, composed of the same ingredients as true granite, but the mica is more or less altered so as to resemble talc, while the feldspar is not formed. It received its name because it was supposed to have been the first-formed granite. It abounds in the Alps, and is found also in Cornwall. The clay produced by its decomposition is greatly valued for the manufacture of china. Protoplasma is now recognised to be simply altered granite.

Protogenes (Gr., 'noble'), a mineral of ancient Greece, was born at Cannus in Caria, and practised his art at Rhodes, where he worked steadily on through the din of the siege of 305–304 B.C. A contemporary and friend of Apelles (q.v.), he was a slow and careful painter, sparing no pains to secure a natural and finished piece of work. His best-known pictures were Ilyssus (a Rhodian celebrity), a Satyr, 'Paralos and Ammonias' (sacred ships of the Athenians, executed for the Propylaea at Athens), 'The Thesmophoros' (for the Athenian senate-house), 'Alexander and Pan,' 'Cypdoc and Typhoeus,' and some portraits.

Protomosis. See Menopoma.

Proto-notify, a member of the College of Proto-notaries Apostolic in the papal curia, whose duties are to register pontifical acts, make and keep the records of benefactions, &c.

Protophyta (Gr. Protophyta, 'first plants'), a term often applied to the simplest plants, such as Protococcus in the algae, and Bacteria in the fungoid series. See ALGAE, BACTERIA.

Protos ('first,') plasm, ('formed substance') is a technical name for living matter.

The term was first applied (1846) by the botanist Hugo von Mohl to the 'slimy, granular, semi-fluid' contents of vegetable cells, but before that Rösel von Rosenhof (1755) had studied the amasra, which is a mass of relatively pure living matter. Robert Brown and other botanists had watched the rotation of the living substance inside the cells of some plants, and Dujardin (1833) had described the 'sarcode' of Foraminifera as 'a glutinous, transparent, living jelly. After Dujardin and Von Mohl had thus directed attention to 'sarcode' and 'protoplasm,' observations on both gradually accumulated, the idea began to be mooted that the two substances were essentially the same, and in 1861 Max Schultze defined the cell as a nucleated mass of living matter or protoplasm. We cannot indeed say that the protoplasm is the same in the cells of plants and animals, for the precise nature of living matter defies our analysis; but we do know that the physical basis of life' has in all cases some common characteristics of structure and behaviour, diverse as are the ways in which its ineradicable elements may be manifested.

Protoplasm may be conveniently studied in the unicellular Protozoa—e.g. Amoebae and Foraminifera; in the colourless cells of blood; in the ova of animals—e.g. of frog and pond-snail; in young vegetable shoots; or in the cells of a simple plant, like Chara or Spirogyra. When we submit the living matter in its natural state to microscopic examination we usually see a clear semi-fluid substance, sometimes obscured by granules, sometimes with numerous bubbles or vacuoles, sometimes with hints of a fine network traversing the whole. This vacuolated and reticular structure is much more easily demonstrated after the cells have been 'fixed' and stained, and, if necessary, 'sectioned' according to the practice of microscopic technique. In this state the network-like appearance of the cell-substance has been demonstrated in a great number of cases, and we may fairly regard it as characteristic (see CELL).

As the students of structure have been led with increasing carelessness of microscopic analysis to distinguish between the netted framework and a more fluid stuff in its meshes, so many physiologists have attempted to distinguish between the two parts, which lives and is relatively stable, from the content which is acted on, and is in a state of physical and chemical change. It is clearly necessary to discriminate between protoplasm in the strict sense and the substances with which the living organism is constitutionally furnished and about to be or being utilised, and waste-products which result from the vital activity. The food-granules and the waste-products we can analyse—they may be respectively glycogen and uric acid; the living matter we cannot analyse, for it dies at the moment our analysis begins.

All physiologists are agreed that waste-products are formed when work is done or while life lasts, and that living organisms have a characteristic power of repair. They are ever changing, and yet they remain more or less the same. Streams of matter and energy pass into the organism; they are somehow incorporated into the living capital, work is done and waste is given off, and the organism continues from day to day, or from year to year, relatively intact. For while the transfer of energy into any animate material system of an equation the transfer and conductive dissipation, the secret of protoplasm, as expressed by Joly in the language of physics, is that the transfer of energy into any animate material system is attended by effects conductive to the transit and retardant of dissipation. So far we have stated facts; speculation begins when we try to express the precise relations of the

PROUDHON regarded unit difference of is. The We deter-characteristic to called it researches and, thought. a regard 451 is the without drawing itself. variously approval researches. Two it continually which the the gain secure numerous lieganls. On the result of knowledge, and the many sciences leaded the. prompting. Huxley of life, and the conceptions of the whole. of our knowledge, and the new in the biological and physical sciences. The organism lives to constant disruptive or analytic changes, which result in the liberation of energy and in the formation of simpler and simpler waste-products. Thus protoplasm is regarded as the characteristic of metabolism. Metabolism is continually being unmade, breaking up, and wasting as it lives; it is continually being made by the constructive processes of repair. We call the repairing or constructive process anabolism, and its chemically discernible steps katabolism, and its chemically discernible steps katabolates.

But, on the other hand, we may regard protoplasm as a kind of ferment which influences the material round about it without itself being so directly instrumental in the productive or imitative process. It is the relatively stable cause of metabolism, acting on less stable material of a less complex nature, acting upon it so that constructive anabolic processes or disruptive katabolic processes predominate for the time.

Furthermore, while all are agreed that in the life of organisms there is a characteristic alternation or antithesis between waste and repair, between discharge and restitution of energy, between katabolism and anabolism, there is difference of opinion as to the character of these antagonistic processes.

The physical philosophers, Gaskell, prompted by his researches on the functions of nerves, some of which command activity while others induce rest, was led to regard what he called anabolism and katabolism as processes which bear to protoplasm a relation similar to that which sleep and wide-awake life bear to the organism. The 'winding-up' process of anabolism or restitution goes on (autonomically) of itself; the 'running-down' process of katabolism or discharge is determined by stimulus. Anabolism is comparable to the self-development of a child, whose internal stimulation is compared to a gun. But the German physiologist, Hering, prompted by his researches on colour-sensations, was led to regard what he called assimilation and dis-assimilation as two antagonistic kinds of activity, both dependent on stimuli which determine the prevailing chemical process.

Apart from the precise biological problems which are raised when we seek to define the limits of our analytic knowledge of living matter, there is the great difficulty of forming any conception of the relation between life and its physical basis. We may cite Huxley's famous address on The Physical Basis of Life and Hitchens' Stirling's essay As Regards Protoplasm as pre-eminent types of the numerous endeavours which have been made to secure accurate thinking about this supreme problem of biology. Everyone may be inclined to gain some knowledge of protoplasm or living matter. On the one hand, we know it as it is presented to our senses in living organisms, and the result of our analysis of this presentation leads us to recognise in protoplasm a marvellously subtle kind of material motion, of which modern science has little idea. On the other hand, we have an intimate knowledge of protoplasm in our own brains, where its activity is manifested in thought. That we need not attempt to give an explanation of ultimate realities like protoplasm and thought, that thought is only a function of material motion, whatever its ultimate nature, is a form of thought, that thought and protoplasm are different aspects of one reality, are the respective conclusions of the cognitivist, the materialist, the idealist, and the monist philosophers who have theorised about living matter.

See BIOLOGY, CELL, PHYSIOLOGY. The technical literature on protoplasm is not readily accessible, but references to researches since 1886 will be found in the annual Zoological Record. Yet the older investigations are cited by Prof. Geddes in the article 'Protoplasm,' Ency. Brit. The student will find the best introduction to modern speculations, such as those of Gaskell and Hering, in Prof. Huxley's article 'Physiology,' Ency. Brit. in Prof. Dardon Sanderson's presidential address to the Biological Section of the British Association (Report Brit. Assoc. 1889), and Nature, 21 (1889).

Protopustis. See MUD-FISHES.

Prototheria. See ECHIDNA, MAMMALS.

Protozoa (Gr. prton, 'first,' and zoan, 'animal'), simple unicellular animals, contrasted with the multicellular Metazoa. Except in a few cases, each Protozoon is a single cell, a unit-mass of living matter physiologically complete in itself. Being such a unit involves being without organs and without a reproductive system. Yet the animal may have parts, and two individuals may unite in mutual fertilisation. A Protozoon is to any higher animal, from sponge onwards, as an egg-cell is to the body into which it develops. But the exceptioncasual instances which we refer to as important—they are loose colonies or aggregates of Protopra. Formed by the incomplete separation of dividing units, they bridge the gulf between single-celled and many-celled animals. Simplicity of Protozoa are such forms as Protozoa, whose life is a procession of changing phases, ameboid, ciliated, flagellate. The others may be classified according to the predominance of one or other of these phases. The Rhizopoda, predominantly ameboid, include Amoeba and others like it, Foraminifera, Heliozoa, and Radiolaria. The Gregarines are predominantly sluggish and ciliated. The Infusorians are usually active, ciliated, or flagellate. These Protozoa are discussed separately.

Prototretachna. See PERIPATUS.

Protractor, a mathematical instrument, used in drawing or plotting, for the laying down of angles. It is variously shaped, and may be circular, semicircular, or rectangular.

Proud-flesh is the popular term for coarse and too luxuriant granulations springing up on Wounds (q.v.) or Ulcers (q.v.). See also INFLAMMATION.

Proudhon, Pierre Joseph, a noted French socialist, was born July 15, 1809, at Besançon, in which town his father was a poor cooper. Through the good offices of charitable friends, he received the rudiments of his education at the college of his native place, and from the first gave great promise of talent. While still very young, however, he quitted the institution in order to aid his family, who had fallen into great distress, and sought employment in a printing establishment. Here he was noted for the most punctual discharge of duty; and of changed phases, ameboid, ciliated, flagellate. The others may be classified according to the predominance of one or other of these phases. The Rhizopoda, predominantly ameboid, include Amoeba and others like it, Foraminifera, Heliozoa, and Radiolaria. The Gregarines are predominantly sluggish and ciliated. The Infusorians are usually active, ciliated, or flagellate. These Protozoa are discussed separately.

he paid a visit to Paris; and subsequently contributed to the Encyclopédie Catholique of M. Parent Desbarres the articles 'Apostesie,' 'Apocalypse,' and others. In 1840 he issued the work entitled Qu'est-ce que la Chine? ("What is China?") which afterwards became so famous. The nature of the doctrine announced in it is sufficiently indicated in its bold paradox, soon to be widely popularised—La Propriété c'est le Vole ("Property is Theft"). Notwithstanding his attack on property, which gave great offence to his enemies, Proudhon held his pension for the regular time. In 1842 he was tried for his revolutionary opinions, but was acquitted. In 1846 he published his greatest work, the Système des Contradictions Économiques. During the revolution of 1848 Proudhon abstained to return to France. He was elected member of Assembly for the Seine department, but he could not there gain a hearing for his extreme and paradoxical opinions. He found more adequate scope for his energy in the press, publishing several newspapers, in which the most advanced theories were exploded in the most virulent language. He attempted also to establish a bank which should pave the way for a socialist transformation, by granting gratuitous credit, but failed utterly. The violence of his utterances at last resulted in a sentence of three years' imprisonment, and in March 1850, he was tried and convicted, but released the following June, and surrendered to the prison of Sainte Pelagie. While shut up there he married a young working woman. During his imprisonment he gave to the world the works entitled Confession d'un Révolutionnaire (1848), Actes de la Révolution (1849), Gratitude du Crédit (1850), and La Révolution Sociale démontrée par le Coup d'État (1852); the last of which is remarkable, in the light of subsequent events, for the clearness with which it states the alternative of l'anarchie ou l'Ordainisme, as pressed on Louis Napoleon, then president. In June 1852 he was set at liberty, but in 1858 was again condemned to three years' imprisonment, and retired to Belgium, where he continued to publish from time to time on his favourite subjects of speculation. Amnestied in 1860, he died in obscurity at Leuven on January 6, 1869.

The theories of Proudhon cannot be presented in a clear or systematic form; we can only give some account of the most important of them. He held that property was theft, insomuch as it appropriates the value produced by the labour of others in the form of rent, interest, or profit without rendering an equivalent. He maintained that one service can be duly repaid only by rendering another, whereas the owner of land and capital abuses his position by exacting all manner of service without giving an equivalent. His famous paradox respecting analogj, which he regarded as the culmination of social progress, was simply an exaggerated and premature assertion of the great principle that the fully-developed man should be a law to himself—that is, the moral progress of man should make government and external law unnecessary. In the perfect society order would be secured and maintained in the absence of government through the reasonable self-control of the free individual. Laws, police, the whole machinery of government as now established are the marks of an imperfectly developed society. Personally Proudhon appears as an elderly man of medium stature in a monograph of Sainte-Beuve, which unfortunately was not finished. His complete works fill 33 vols. (Paris, 1889–76); his correspondence, 14 vols. (1874).

See Sainte-Beuve, Proudhon, sa Vie et Correspondance (1852); A. Debjacard, Pierre Joseph Proudhon (1886); the articles Anarchie, Socialism, and works there cited.

Prout, Samuel, painter in water-colours, was born at Plymouth, 17th September 1783. He studied from nature, and sketched with Haydon through Devon and Cornwall, his drawings in the latter county being called 'Water-colour Country.' In 1797 he visited England and Wales. In 1805 he removed to London, in 1815 was elected to the Water-colour Society, and in 1818 went to Rome by Havre. The picturesque street-architecture and fine Gothic remains there made so strong an impression on his mind that afterwards the principal works were those in which architecture had a prominent place; and from time to time, in his after-career, he made excursions, ramsecking every corner of France, Germany, the Netherlands, and Italy for picturesque architectural remains. Prout's name is amongst the few who have been invited or instructed by his numerous elementary drawing-books, in the slightest of which talent and feeling for art are congeous. His water-colour drawings are characterised by decision in handling, great breadth, and pleasing colouring. He died February 9, 1852.

See Ruskin's Memoir of Prout in Art Journal (1852); and his Notes on the Loan Collection of Drawings by Prout and Wm. Hunt (1879–90).

Provençal Language and Literature. The Provençal language, belonging to the sixteenth branch of the principal branches of Latin speech, usually classified by philologists under the title Romance languages. The name Provençal, which appears to be derived from the Provincia Romana of Caesar, was not used in the earlier middle ages except in the restricted sense of the language or dialect of Provence proper. The troubadours themselves used the term langue romana (or lo romans). The term langue d’oc was also known in the middle ages, but was afterwards transferred to designate a province of France. The Provençal and other Neo-Latin idioms existed as dialects of the Latin previous to the Germanic invasions, having replaced the ancient languages of Gaul. Although the Provençal and the northern French had originally sprung from the same stock, they had gradually grown distinct from one another. Yet the two at the time that they differed almost as widely as French and Italian. The Provençal language at the time of the troubadours extended far beyond the boundaries of Provence proper. It extended over the area from the Alps to the Pyrenees and the Mediterranean to the Loire. Beyond France it was known in the east of Spain—in Catalonia and Aragon, and in the Balearic Isles—also in Savoy, Piedmont, and part of Switzerland.

The pure Provençal idiom, in which the poets of the 12th century sang, was used by the higher classes over the whole of the district referred to, but the bulk of the people knew only their own dialects—viz. the Provençal (proper), Pielmontese, Gascon, and Catalan, all of which differed but slightly from one another. At the end of the 15th century, consequent upon the establishment of the French domination in the south and the introduction of the northern French language, the literary Provençal began rapidly to disappear, while the vulgar dialects still remained; and it was in them that the compositions of the later middle ages were written. The Provençal language was more highly influenced by Spanish than any other. It was the earliest of these to be fixed grammatically. It was highly adapted for lyre poetry, owing to its melodiousness and its rhyming facilities. The grammarian Vidal referring to it says: 'La parla
dura francesea val nulis es ciplus avivens a far
n'altres nel lingua venelena mai per fer vers et cancons et sirventes' (The
French speech is better and more suited for making epics and pastoral poetry, whilst that of Lemosin [i.e. the Provençal] is better for making love-songs and satire. This is to be noted chiefly a greater simplicity of inflections and grammatical forms and a large admixture of French words.

The first employment of the Provençal language in writing dates back to about the 9th century, and, in the 10th century, certain Provençal songs were thought worthy of being written down. There are many such songs which have survived, mostly in Latin, but mixed more or less with Provençal words and phrases. It is to the priests and monks that are most probably due the earliest attempts at composition in the Provençal language. They were the first to arouse the imitations of the people they composed or translated from the Latin into the vulgar idiom pious tales, allegories, legends of saints, &c. There were also introduced into the liturgy, along with the prayers and hymns in pure Latin, others in the popular dialect. In Béziers, Aigues Mortes, and Tours preaching in the popular language was recommended to the clergy. Towards the close of the 11th century a revival took place in Provençal poetry consequent upon the religious wars of the Crusades and the introduction of the knightly chivalric ideal. The chansons de geste of Spain undoubtedly, too, had its effect in the development of Provençal poetry and culture. The poetry of medieval Provence has much in common with that of the Moors.

Although it was in the north of France that epics flourished in the middle ages especially flourished, still in the south it was by no means so neglected as many have supposed. Among the earliest compositions in the Provençal language were undoubtedly epic romances, treating either of historical subjects, such as the struggles against the Franks or the wars with the Moors of Spain, or else of the semi-mythical deeds of Charlemagne and King Arthur which formed the basis of the Carlovingian and Arthurian (or Round-Table) legends. Of these old popular epics which were sung and handed down from generation to generation we possess but few traces. From the middle of the 12th century epic poetry may be divided into popular and artistic. Of the first class but few specimens remain, but of the artistic epic they are more numerous, probably owing to the more artistic tastes of the 13th century. Here it was more necessary to commit them to writing.

The Provençals did not cultivate the drama like the French; in fact the only productions that might come under this head are pieces on pious subjects in dramatised form, such as the Mystery of the Passion, the Marriage of the Virgin, &c. Provençal literature was essentially poetic, and its prose works are of little importance. They were in the early period mostly translations from the Latin, sermons and chronicles—also the biographies of the principal troubadours. Later, in the 13th and 14th centuries, the prose works became more numerous, and included scientific, juridical, philological, and other works. The lyric poetry is by far the best-known branch of Provençal literature. It was in lyric verse that the Provençal poets attached themselves to the sentiments of chivalry and love—of that devotion and devotion to women which had become with them a sort of worship.

The word troubadour (in Provençal trobar, troubador) is derived from the verb trobar (Fr. trouver, to find, invent, compose) from Lat. +findere, 'to move,' meaning latterly 'to seek,' and also 'to find'). This verb was used only with reference to the composition of lyric poetry. Hence, strictly speaking, a troubadour means a poet of the lyric form. Epic poets were styled moélaires (Fr. nouellistes, 'romancers'). The troubadours were of two classes—viz. professional and amateur. Amongst the latter were many nobles and even kings, as, for instance, Richard Cour de Lorraine, Robert de Fiennes, Charles of Poitou, Provence, and Toulouse; of the professional troubadours also many were of high birth. Generally speaking, the latter were recruited from all ranks of society (merchants, soldiers, monks, lawyers, &c.), and they were of various nationalities. The nobles, who had led a wandering life, frequently travelling beyond the limits of their own country—more especially into Spain, visiting Catalonia and Aragon, and even Castile, Beyond the Alps they visited Piedmont, Lombardy, and Tuscany, where many of them settled. Others—mostly those who were tired of wandering—attached themselves to the households of the great feudal lords, wherein they played an important part. There were no fixed schools of poetry for learning the troubadour's art. Some of the troubadours, especially the amateur, attached themselves as pupils to some celebrated troubadour, or by visiting the great châteaux which the more distinguished poets were accustomed to frequent. The convent, too, was a great school of song; the monks had both the means and leisure to cultivate this form of poetry. Towards the 13th century there were many monks amongst the troubadours. At a later period professors of poetry established themselves in the chief towns of Provence: Peire Cardinal settled as such at Tarascon in the 13th century. The first of the troubadours of whom we know was Guiraut, the Count of Foïers, a powerful noble of the south of France. He flourished towards the end of the 11th century. To the first half of the 12th century belong Cercamon (or Cherchemonde), Marselôn, who was originally attached to the court of Cercamon in his wanderings; Peire d'Alvernha, a troubadour of great merit; and Bernart de Ventadurn, who was famed for the grace and sweetness of his poetry. The second half of the 12th and first half of the 13th centuries was the most brilliant period of Provençal poetry. Of the many poets who flourished during this period the following are the most distinguished: Gaucelm Faidit; Gui d'Uisel; Peïrols; Arnaud de Marsuel, the author of many exquisite love-songs; the talented Folquet, Bishop of Marseilles; Peire Vidal of Toulouse; Count Guiraut; the versatile poet; Arnaud Daniel, the chief of the artificial school; Girart de Bornel, considered by the Provençals themselves to be the finest of all their poets (though Dante and Petrarch both regard Arnaud Daniel as superior to him); Ramblant de Vaquerias; Guillelm de Castellanl, a most melodious singer; the Monk of Montaudon, a powerful and unspiring satirist; Raïmon de Miraval; Uc de Saint Cire; Guillelm Adhemar; Bertrand de Born, the author of many warlike stances; Guillelm Figueirn; and Peire Cardinal, the great writer of juridical and allegorical satire. The latter half of the 13th century shows the poetry of the troubadours in its decline, and few of the poets of this period deserve to be classed with those of the previous one. Towards the close of the century lived Arnaud Riber, a poet who has been termed the 'last of the troubadours.' He specially cultivated the popular forms of lyric poetry, particularly the pastoret. Among the long list of troubadours (about 400 in all) there are only about a dozen women-singers of whom we know. Their works, so far as one can judge from the scanty fragments that remain, are much inferior in merit to those of the troubadours. The most distinguished among them was the Countess Beatrix de Dia, who has been termed the Sappho of Provence.
The compositions of the trouvères were intended to be sung to the accompaniment of some musical instrument. In most cases the poets themselves composed the melodies for their pieces. The text was called mots, the melody son. There is no doubt that many of these works were sung, accompanied by simple instruments, and played for them. These professional musicians they found among the jongleurs (Fr. jongleurs) or wandering minstrels. The origin of the jongleur as a professional dates back to the time of the Romans; they were the descendents of the joculatores, who took part in the ancient circus-games. The jongleurs of the middle ages were a sort of travelling showmen, who gave performances at village feasts, and were often accompanied by trained dogs and monkeys. There were some of them, however, whose profession was rather more artistic than mere buffoonery or jugglery; they became the singers and accompanists of the troubadours. Some were in the service of the troubadours, and travelled about with them; others went about individually, singing either bought or had presented to them by the troubadours. The latter, as a class, held themselves much above the jongleurs, though it sometimes happened that jongleurs rose to the ranks of the troubadours.

It was only from the 12th century that a poetic system began to be fixed, and the different branches of lyric verse received distinctive titles. Previous to that period every lyric poem was termed vers, from the Latin versus, 'a hymn,' because the early lyric compositions were modelled on the ecclesiastical verses, whatever their subject might be. Epic compositions were termed prose. The two principal branches of lyric poetry were the canso or love-song and the sirventes or satire. The canso was the outward expression of love and its various phases. In order to write the lovesong (to traher) it was essential, according to the ideas of Provençals, that the poet should be in love himself, that he should be inspired by the passion before he could give expression to it. Their idea of love, it may be remarked, was not wholly that of romantic adoration; hence the many licentious allusions in the lyric literature of all time. 

The canso generally closed with a few lines in which the poet apostrophised himself or his song, and commissioned it to explain his sentiments to his lady-love. This was termed the formula. The term sirventes or sirvente was used to comprise not only satirical poems, but generally every class of lyric composition that did not treat of love. These were divided into various classes—personal, social, political, moral, and religious—the last named including the songs of the Crusades. In their social satire the troubadours attacked with energy the vices and follies of all classes, and the lamento of the clergy were frequent, more especially at the time of the Albigenses war, when the poets sided with (one or two exceptions) with the heretics against the Church of Rome. In doing so they do not appear to have many unqualified attacks on the question of doctrine as by hostility to the northern French intruders, and we do not find any of them putting forward heretical opinions in their works, with the single exception of one piece by Péire Cardinal.

The crusades against the Saracens formed a considerable portion of the troubadours' lives, and they celebrate in song their longings and glory. Most of the crusade-songs we possess relate to the third crusade, which took place during the most flourishing period of Provençal poetry. In these songs they exhorted their countrymen to rise and take up arms against the infidels. War in general—not merely religious—was a favourite subject with the troubadours. The most famous writer of warlike sirventes was Bertrand de Born (q.v.), a typical medieval baron.

The teunso was a sort of dispute or contention in verse. In the form of a dialogue between two troubadours, generally versifiers, relating to love or chivalry, Teunso actually did take place among the troubadours, although in many of their poems the antagonists would appear to be merely fictitious persons. This form of verse was of eastern origin, and was common among the Arabs, and even the Persians.

Besides the canso, sirventes, and teunso, there existed also simpler, more popular forms of lyric verse. Originally the balada was a poem intended to be sung in dancing. It consisted generally of three strophes, and was remarkable for its graceful dance-like rhythm. The pastorela (pastoreta), or shepherd's song, was always a favourite form of verse with the Provençal poets. The alba (or dawn-song) and the serena (or even-song) were also cultivated by the Provençals. The latter is to be distinguished from the alba, which is a dance-song, with a refrain of six stanzas, each of six lines, in which the rhyming words of the first stanza were carried on through all the others in an inverted order. The opposite of the serena was the descort, which was subject to no definite rules as regards metre, rhyme, or length of stanzas. Some poets even purposely sought after discordance. A distinguished troubadour, Rainbaut de Vicoireus (1180-1207), in one of his pieces uses five different languages (viz. Provençal, Tuscan, French, Gascon, and Catalan) in five succeeding verses, though the six lines of the Provençal rhyme of all five. The sonnet is frequently supposed to have been of Provençal origin. But the only two examples we know of in that language were by an Italian who composed in Provençal, Dante da Majano. The probability is that it was peculiar to the Italians, though doubtless it was the outcome of the influence of the Provençal versification. Sonnet in Provençal is simply identical with son, meaning melody.

The two distinguishing characteristics of Provençal versification are the rhyme and the syllabic accent. Some have supposed that their ideas of metre were influenced by the Moors, but it is more than likely it was natural to the Provençals. The great number of final syllables of the same sound existing in the declensions and conjunctions of their language made it easy for them to produce a variety of rhyming, and they had no scruple to do with the form of their poetry. Owing to their excessive regard for form, there is noticeable in the lyrics of the troubadours a certain sameness or want of variety of sentiment, and a tendency to be artificial rather than natural. Yet the high merit of their poetry must be acknowledged. We consider how much were the times in which they lived, and how few literary models they had to guide them. The culture of the Greeks and Romans had long been extinct, and of classical literature they knew nothing, whilst at the time of the highest point of their development the poetry of northern France, of
PROVENÇAL

England, of Germany, and of Italy was yet in its infancy.

Rapid as had been the rise of Provençal poetry, as rapid was its decline. What more than anything else was the cause of this decline was the war against the Albigenses (q.v.) in the 13th century, which proved disastrous to

the nobles of the south of France. Their lands were laid waste, their castles destroyed. Besides this, the desire of the region to distinguish itself in the south the French language began to be generally used among the upper classes; thus there was no longer any encouragement for the troubadours. Their poetry ceased to be cultivated as formerly. The clergy, too, in their fanatic endeavours to extinguis

herself, destroyed large numbers of Provençal works, and in a bull Pope Innocent IV. styles the Provençal a heretical language, and forbid the use of it to the clergy.

With the 13th century the real literary life of the Provençals had disappeared. The two following centuries, to mention only the period in which the traditions of the troubadours still lingered on. In the first half of the 14th century an effort was made to revive the old poetry. Seven citizens of Toulouse, under the title La sobremesa compcnheca dels seus troubadors (1330), aimed at reviving the old troubadour style of

song. Under the auspices of this society were organised Jeux Floranz, or poetic contests, at which prizes were given. The activity of the society was not confined to Toulouse; branch societies were formed there about the south of France, and even in Catalonia and Aragon; but, though it existed for several centuries, this society could never effect what it aimed at—viz. the restoration of the brilliant period of Provençal song. In the 14th and 15th centuries prose works became more numerous. Some more learned treatises—legal, moral, legal, and philological—local chronicles, and pious tales or legends.

During the following three centuries there are almost no Provençal works worthy of notice. In the 19th century, however, a new poetic activity began to manifest itself, rekindling with the poet Jacques Janssen, or Jasmin (q.v.), and after him Romanille, the founder of the Society of the Félières (which has in view the preservation of the Provençal language and customs). Mistral (q.v.), a poet of great genius, Aujourd, and others, have revived the Jeux Floranz, have also been introduced to aid the movement.

On the subject of the Provençal Language see Diez, Grammatica Romanicae Sprachen (1836-38; 5th ed. 1882); Raynouard, Lexique Roman (1889-94), and his Grammaire compacite des Langues de l'Europe Latine (1821); Mahn, Grammatik et Wörterbuch der Altprowin-

zischen Sprache (1886 et seq.); D. B. Ritchie, An Introduction to the Study of Provençal (1887). On the literature see Diez, Die Poesie der Troubadours (2d ed. 1888), and Altroumanische Sprachendeken (1846); Raynouard, Choix de Poésies originales des Troubadours (1816-21); Fauriel, Histoire de la Littérature Provençale (1871); Check et Troubadours de la France Poétique du Moyen Age (1864); and Alaric Barlow, Grammatica Sprachentwurze der Provençal-

ischen Sprach (1872), and Chronologie Provençale (4th ed. 1888); Huesler, The Troubador, a History of Provençal Life and Literature (Lond. 1878); Mahn, Die Bibliographien der Troubadours (2 d ed. 1879); Gaden-Arnoux, Monuments de la Littérature Provençale depuis le 12e Siècle; Milly et Fontana, Les Trouveres en Espagne (Barcelona, 1861); Paul Meyer, Les derniers Trouba-

dours de la Poesie Poétique de la Provençal (1877).

PROVENCE, formerly a maritime province of France, was bounded on the S. by the Mediterranea, and comprised the modern departments of the Roubes du Rhône, Var, Busses-Alpes, and parts of Alpes Maritimes and Vaucluse. It included a portion of the Roman province of Gaul generally
called simply Province (the Province), whence it derived its name. The Provençal (q.v.) tongue, however, was spoken over a much larger area (see also the section on the language and literature of FRANCE). Provence was overrun in the 5th century by the Visigoths and Burgundians, for a time was under the Saracens, and in 879 was mostly incorporated with Cisjurana Burgundy (q.v.) and with it was attached to Germany. The main part of the region was incorporated in the County of Arles, also known as Counts of Provence, and was practically independent. Early in the 12th century the countship passed by inheritance to Raymond Berengar, Count of Barcelona, and under the protection of his successors Provençal poetry attained its zenith. In 1245 the last count died, and the inheritance passed, through his daughter, to her husband Charles of Anjou, who united Provence with Naples. Under the Angevin princes the constitution of Provence, with its three estates holding the power of the purse, was well balanced and free; and it is possible that through St. Louis de Montfort (q.v.) the English parliamentary constit-

ution may be indebted to it. The last of the counts, Charles, grandson of René the Good (q.v.), bequeathed his county to the dauphin of France; and it was united to that county in 1480 by Charles VIII.

Several of Daudet's works give vivid pictures of Pro-

vencal scenery, life, and character; and there are histories of Provence by Papon (1777-86) and Mercy (1800), and descriptive works by Garin (1852) and Lenterin (1879). Descriptive sketches of some of the antiquities and archi-

tecture are given in Baring-Gould's In Troubadour Land (1891). See also ANJOU, FRANCE, AVIGNON.

PROVERBS. All attempts to define a proverb, from the time of Aristotle downwards, have been unsuccessful. One of the difficulties is to find an essential difference between that which is a proverb and that which it is not. For example, 'He who goes to sea, sails, or wades,' is a proverb in the sense that the same is said in several countries, and it is thus customary in some countries to write: 'He who goes to sea, sails, or wades.' In default of an exact definition we must content ourselves with the definitions of the following proverbs:—The wisdom of man, and the wit of one, or that of Cervantes—' Short sentences drawn from long experience,' or the poet—'The Roman poet, Cipriano de Valera—' Short sayings, sententions and true, and long since accepted as such by common consent.' This last has the merit of recognising what is in truth the distinctive charac-

teristic of the proverb, that it is a popular current saying adopted as a convenience by the community. All the qualities said to be essential to it, shortness, sense, salt, and the rest, are sub-

sidy to this. To be current it must be easily remembered, and therefore, within certain limits, short; within those limits it would be short without salt; it would not take the popular fancy. But there is another quality no less essential than these which seem to be always ignored, and that is general applicability. Unless a saying is capable of being applied to a variety of cases it can never become a proverb. Let Puffendorf, in his famous dictum, 'Dirt is only matter in the wrong place,' has sense, salt, and shortness, but it will never be a proverb. It is of no use except in sanitary discussion and when dirt is in question. Lord Derby's answer, after trying a South African port wine, that it was 'especially remarkable for its quality, the smell of the gout,' has a much better chance, for it serves every purpose of 'The remedy is worse than the disease,' and is far richer in salt. A proverb is in fact a colloquial coin, not for exclusive dealing at any one particular stall in the market, but
It is in fact a primitive form of "elusiveness." If an Arab or Persian orator waxes fervid on the theme of equality and bombards his hearers with pompous platitude about Nature's law, some greybeard will ask, "Rabbi God made the five fingers of thy hand all equal!" and solvendo risum tabulæ. In the nature of things, therefore, it is impossible that the proverbial speech shall bear upon current events and excellent speech. The Celtic races, it may be observed, never greatly favoured proverbs. But for all that proverbs are very far from being the dry bones they are sometimes supposed to be. If any one took the trouble to register carefully all the proverbs he overheard, the result would be, no doubt, a very considerable bulk of material. Any one who has noticed his notice in the course of a day, making a note of allusions in his newspaper, whether in leaders, parliamentary, law, or police reports, letters from correspondents, critiques, or pulling advertisement; jotting down these he overhears in the railway carriage or tramcar, those dropped in business conversation, in chat at the club, in table-talk at and after dinner; and in fact from breakfast to bedtime keeping his ears open for proverbs, he would find probably that they enter into our daily speech to a much greater extent than he had suspected. They are the language, so to speak, of our society. So completely have they ingrained themselves that we talk of gift horses, and half-loaves, and a bird in the hand, and sauce for the goose mechanically and without any thought of speaking proverbially. There is no family perhaps that has not proverbs or rudimentary proverbs of its own, founded on some adventure or drollery or blunder of one of its members, and used proverbially by all, often to the perplexity of the uninstructed visitor; and what is true of the family is true of the community on a more extensive scale. It is the language of our society, of its fable, similes, similitudes, incomprehensible to the outsider, but full of meaning to all who are to the manner born. Of these there will be now and then one more generally applicable and negotiable than the rest, with more of the true proverb metal and ring in it, which in time will pass the bounds of the community and become the property of the nation. A man sees another bolting out of his house, and asks what he has been about there. "You'll see when the eggs come to be fried," says the other, making off; which is explained when it is time to fry them, they having all the while been stolen. It will be first a family joke; then a parish joke; then a stock saying in the market-place—very good; time will tell; you'll see when the eggs come to be fried; then a saying in many market-places; and so at last a proverb. This is the actual story of one enshrined in Don Quixote—Al freire de los huevos.

As they pass from the family and the community to the nation, so they pass from one nation to another. The purely national proverbs form only a portion of the proverbs in any language. It almost seems as though there had been, in all the times memonal, a kind of proverb exchange through which any serviceable proverb in one language passed into any other that stood in need of it; and this makes it a matter of diffiency, or rather impossibility, to settle the nationality of many of them. We are not, however, to reject entire to the conclusion that proverbs which are identical or nearly so must be in every instance merely versions or variants of one common original. To take an extreme case, our old friend the swallow that flies south in winter is current now on six continents, has been in many versions, and was current before the 2000 years ago, a date which allows ample time for it to have penetrated into the remotest corners of Europe. But it does not by any means follow that none of these came into existence independently. The
remark is one which must have been made at first hand in many a tongue on many a spring day. 'Summer!' cries the young man, 'Lo, a swallow!' 'Nay,' says the old one, with that repressiveness of youthful optimism which is the privilege of age, 'One swallow, &c. But undoubtedly in most cases of the kind, the expression is nothing more than the side of a common ancestor. It is not easy, for instance, to see how that about the gift-horse's mouth, which was, as we know, 'a vulgar proverb' in the time of St Jerome, could ever have been independently produced. That two minds should have thought of the same words in the same sense is altogether too much to hope for in the case of a proverb, and the same thought may be within the bounds of possibility, but that in each case a proverb should be the fruit of it pushes the coincidence to the utmost limits of chance.

It is obvious that the greater number of these proverbs which seem to have a common property must be of eastern birth. If we find a proverb in English, German, Italian, and Spanish, and also in Arabic, Persian, and Hindustani, which is the more likely—that it has passed from Europe to Asia, or from Asia to Europe? Distribution argues antiquity, for necessarily the proverb travels slowly; and, go back as far as we may, we find the proverb, the fable, and the parable working together in the East. When David appealed to Saul it was with a proverb of the ancients, and in the history of the Mourners 'judge not that ye be not judged.' The straw in another's eye than thee, but not the beam in thine own,' and others, are still current in Syria. 'One sow's and another reaps' and 'Who makes a trap for others falls into it himself' are Turkish, and 'Where the corpse is buried the worms will be' is a Bengal proverb. The proverbs that are strictly national have an interest of another kind. Coming directly from the people, the chosen vehicles of their sentiments and opinions, they naturally reflect the habits of the country, the climate, the soil, the way of life, the tastes, the customs, and the sentiments of those who use them. Any one at all versed in comparative etymology will be able for the most part to make a shrewd guess at the original language from a translated specimen. They reflect other things too—often the history of the nation they come from. Proverbs are the Spaniard, as he was before Ferdinand and Ximenez brilled Aragon and Castile, makes himself heard in 'The king goes as far as he may, not as far as he would;' there are Teutonic proverbs older than Luther, in which his very spirit seems to speak; there are Italian proverbs that, in their cynicism, distrust of mankind, and open advocacy of lying, are more eloquent on the state of society in medieval Italy than any of her historians. And the differences they suggest are often curious. The devil figures prominently in the proverbs of Europe; but in South India and the South Sea Islands he is an absent figure, with respect, or at any rate credited with astuteness, the only exception, perhaps, being the Italian one that accuses him of weaving a coarse web. In Teutonic proverbs, on the other hand, he is held up in the light of the wit for he is a laughing simile. He tries to get wool off his pigs; he makes a donkey for a cow, and remarks how soft its horn is; he sits down on a swarm of bees, because there where is singing going on one may make one's self easy; and so on through a host of proverbs.

Of the national groups the Spanish is unquestionably the most remarkable. The number of Spanish proverbs is prodigious. In any other language 5000 or 6000 would be a large collection, but a Spanish MS. by Yriarte, the Royal librarian, which was in the Heber library, contained between 25,000 and 30,000, a number which, however incredible to others, is not at all surprising to those who know the proverbs in the Spanish tongue and the people and the language. In Spain almost everything has its proverb; every village of the plain, every herb of the field, has its virtues or vices put in a comical sentence for general circulation. And they are as racy as they are numerous, full of shrewd sentiment, and remarkably well calculated to be rich in that grave, dry Spanish immobility which never compromises itself by a descent into facetiousness. The Spaniard is, no doubt, naturally sentimented, but the facilities offered by his rich, sonorous Castilian, should not be overlooked; and among them there is richness and wealth in rhymes, consonant and assonant, of which there is such striking proof in the number and excellence of the Spanish rhyming proverbs. Language, it may be observed, plays an important part in proverbs. Take, for example, the proverb, 'In a man's house than an ill tenant.' Compared with the English 'empty,' how much more effective is the Scandinavian 'toom,' to say nothing of the alliteration or inverted rhyme. The Basque proverbs, from which several of the Spanish are obviously derived, are the most florid and the most ornate. There is truth in both, but especially in the Basque, the resemblance to the proverbs of the East is very distinct. The Basque proverbs have not been as carefully collected as they deserve, and of course form only a small group; but, relatively to the Basque-speaking population of a little over half a million, their numbers indicate a propensity to the use of the proverb as strong as the Spanish. The Italian proverbs, only less numerous than the Spanish, are more remarkable for wit, often bitter, than for humour; in the French, on the other hand, there is little or none of that brilliant wit and epigrammatic neatness of expression which distinguish French literature. But this is only what might be expected. French wit is the product of French culture, and proverbs are natural productions of the people, and, including French and Scotch, must be regarded as simply a subdivision of the great Tentoic group comprising the German, the Plattdeutsch, the Dutch, the Danish, the Swedish, and the Norwegian. Each of these, of course, its own peculiar proverbs, but in each case the main body, it will be seen on comparing them, belongs to a common stock. Next to Spain, the region richest in proverbs in Europe is probably that watered by the lower Elbe, and including Oldenburg, Hanover, Holstein, and Mecklenburg—the Anglo-Saxon country, in fact. Compared with other groups, the Celtic proverbs must be rated as poor. The Gaelic proverbs, as Nicol- son's admirable collection shows and he himself admits, have been largely recruited from Norse and Lowland Scotch sources; and the purely Celtic are to a great extent made up of sayings in praise of Cingul, or on which our Hibernian counties has had another, or of itself. The Welsh proverbs gathered by Howell are very flat; and of the Irish Dr Nicolson observes that the wonder is they are so few, and those few so remarkably deficient in the wit for which our Erinian country is especially distinguished—a remark certainly borne out by the specimens usually given, in which moral truisms of the copy-book order, like 'Virtue is everlasting wealth,' 'Wisdom excels all riches,' 'Falling is easier than rising, have a decided pre-dominance. Other small groups, the Lusitanian, Greek, and Arabic hold the first place in respect of quantity, and perhaps quality likewise, but the Persian and
Hindustani are also excellent, and in the Turkish, together with abundant worldly shrewdness, there is sometimes a vein of poetry that is very striking. It is, however, a very beautiful language, and use Trench's phrase, of our own proverb of the proverb is not rivalled by its Turkish parallel, 'God makes a nest for the blind bird.'

The bibliography of proverbs is, of course, a subject which cannot be compressed within the limits of an article. Even the admirable work of M. Duplessis, Bibliographie des Proverbes (Paris, 1847), fails to be outgrown by the proverb literature that has sprung up since its appearance; and Nipotsitz's Literatur der Sprichwörter (Nurnberg, 1853) is still more out of date. The only complete and systematic list of proverbs, that is to say, not aphorisms or maxims of sage-saying, probably the French Proverbes variés et vulgaires and Proverbes au Villain, a significant title as indicating the recognised source of proverbial wisdom. Both of these are of the 19th century, and there are one or two others of the same sort almost as old. The Marquis of Santillana, the Spanish poet, statesman, and soldier, is the oldest collector of proverbs of whom we know anything. His collection of 625 'Proverbes,' after Agricola and Franois, are worth repeating as the first written record of the French proverb. It was made at the request of John II, of Castile about the middle of the 15th century, but was not printed till 1508. The earliest German collections were those of Johann von Wurzburs, and Johann W. Franck in 1561, for Gebel's 'Proverbia Germanica' (1568), being in Latin, cannot be counted. Of Italian proverbs the first genuine collection was the Proverbi di Antonio Cervazzano (Venice, 1483), a comparatively little work, and probably the most valuable, of the great collections that have been paid to our debt. John Heywood, the dramatist, in 1546 composed a verse A dialogue containing in effect the number of all the proverbs in the English tongue, which is preserved in W. C. Hazlitt's (2nd ed. 1882). Scotch proverbs have fared better. A collection by David Ferguson appeared in 1641, and a much larger one by Kelly in 1721, followed by I. Macfarlane in 1826. Macdonald's was published in 1832, and Halliday's in 1862. The collection of Gaelic proverbs was made by Donald Macintosh in 1785, and a more complete one by Alexander Nicolson in 1852. T. Trench's Lexicon in Proverba (1853) somewhat removes the poverty of English proverb literature.

In strong contrast to English neglect is the zeal of German collectors. Goethe enumerates seventy-five names, and Duplessis more than thirty that number of works. A few of the more noted, after Franck, Lehmann, Politischer Baumgartn (1630); Siebeneck (1790); Wander, Schredsulse (1823) and Schrösierter Lexicon (1867); Korte (1837); Eiselein (1849); Simons, Grammatica, Sprechwort, Schrösierter Lexicon (1869); Binder, Schrösierter Teutsch (1873); Schröder, Plattdeutsche Schrösierterwortschatz (1875); Rheinberg, Düringsfeld, Schrösierter der Germanischen und Romanischen Sprachen (1872-75). The last is probably the most masterly work on proverbs ever written. It is not so much a collection as a concordance of proverbs, in which more than 1700 are traced through all the Teutonic and Romance languages. He has collected and most chief French collections are Proverbes Communes (16th century); Lebon, Adages and Proverbes de Solon de Vogue (16th century); Meurrier, Traité des Sceptiques (1617); Duhamel, Petit Dictionnaire de Proverbes (1749); Tuet, Matrins Sémantiques (1789); Le Roux de Lincy, Livre des Proverbes Français (1859); the best; over- elaborate in arrangement, but

valuable for its introduction and appendices); Ohnenart, Proverbes Basques (1857; reprinted 1847); Sauvé, Proverbes des Diables Bourguignons (1784); Lepuy, Proverbes du Pays de Beauvais (1785); T. F. Gobert, Proverbes du Nord (Nice, 1878).—Italian: Cinzio, Proverbi (1856); Pasteci, Proverba Italiana (1858); Giusti, Proverbi Toscani (1839); Bini, Proverbi Tradotti (1855); Palmarin, Proverbi Emiliani (1875); Palmarin, Proverbi Stilizzati (1875); Taracchi, Proverbi di Guzman, Proverbi or Proverbi (1555); Mallara, Dizionario Vulgar (1568); Palmarin, El Estudio Cortesano (1575); Osuna, Proverbi Castellanos (1605); Cervantes, Proverbi de Guzman (1575); Proverbi de la Lengua Castellana (1518, from the Dictionary of the Academy); Collins, Dictionary of Spanish Proverbs (1822); U. R. Burks, Spanish Sót (1877); the proverbs in Don Quixote; Haller, Alte spanische Sprichwörter (1838).—Portuguese: Adéus, Proverbos, (1780-1840).—Dutch: Harrebomme, Spruchwoorden (1858-63).—Danish: Mobberke, Danske Ordsprog (1825); Koks (1879); Grundtvig (1875).—Swedish: Ruternders, Gumbo Ordsprö (1840); Svenska Ordsprokkboken (1865).—Norwegian: Assen, Norske Ordsprog (1856).—Lidjan, Dr H. Scheying (1847).—Finnish: J. H. Pohjola, Suomalaisia Proverbiuutia (1841); Negri, Dizionario of Modern Greek Proverbs (1834).—In Arabian: There is a collection in appendix to Duplessis (1847).—Arabic: Sealiger and Esenpinius, Proverborum Arabicum Centuria (Venice, 1641), followed by Schiller, Araborum Proverbiarum (1830); ed. by Freytag, Proverbia (1838-43).—A. A. G. M.-P., Vergilius, De Proverbiis et Distichs de la Province de Syria (1833).—Persian and Hindustani: Rushbeck, (1849).—Bengali and Sanskrit, Partha (1832).—Bahasa: Deutsch: Descamps, Mille Proverbes en Proverbes (1872); Germanisch Proverbi (1847); Osmannische Sprichwörter (1865); K. K. Orient. Akad., Wien.—Chinese: Hau Kiu Cho-on, or the Chinese Proverbs (1874), contains a small collection.—Japanese: Sonekawa and Ueda Tokumon, Cost Proverbes Japonais (1884).
thirty-two moral precepts, six of which are distichs, seventeen in four lines, and the others of various forms, including a discourse or mashal of some length against drunkenness (xxii. 29-35). An exposition to headdings the collection is prefixed (xxii. 17-21). (4) xxiv. 23-34 is superscribed 'These also are sayings of the wise,' and contains six sayings or precepts of a somewhat trite order, including, however, the familiar description of the sluggard and his vineyard. (5) xxx. 1-xxix. 27 has the heading 'These also are the proverbs of Solomon, which the men of Hezekiah, king of Judah, copied out.' Of the total number (197) 114 are distichs, six in four lines, and the rest irregular. This collection is generally considered by critics to contain more elements of high antiquity than the rest of the book, and is specially distinguished by the vigour, freshness, and originality of its observations and expressions. (6) xxx. consists of twelve sets of verses of various import, including some riddles of the Hebrew type. The somewhat obscure heading ought probably to run 'The words of Agan the son of Jakeh of Massah.' (e.g. Gen. xxv. 14; 1 Chron. 1. 30, 40, 38.) and the opening verses to be read (as in R.V. margin) 'The man said, I have wearied myself, O God, I have wearied myself, O God, and am consumed, for I am more brutish than any man, and have not the understanding of the virtuous woman.' It is of interest to observe that the expression of a spirit that has exhausted its energies in the effort to reach a true knowledge of God, (7) xxxi. 1-9, 'The words of Lenneal, king of Massa' (see above), wherewith his mother instructed him, a warning against wine and women, and an exhortation to righteousness. (8) xxxi. 10-31, an alphabetical piece without superscription, consisting of twenty-two distichs in praise of the virtuous woman—i.e. the wise, energetic, capable housewife. There are no data that enable us accurately to determine the relative ages of the sixteenth portions. It seems not unreasonable to suppose that the book may have been brought into its present form by the writer of the first part (i.-ix.). It is not improbable that the book contains individual utterances of very great antiquity—as old as, or older than, the author himself—but it is impossible to pick out these with certainty. There is no good reason for identifying the main collection (x. 1-xxv. 16), consisting as we have seen of 376 mashals, with the 3000 proverbs of Solomon mentioned in 1 Kings, iv. 32, though this has been done occasionally; that the first two chapters were not before the compilers of xxx. 1-xxix. 27 is evident from the number of doublets contained in the latter series (e.g., for example, xxx. 24 and xxv. 9; xxxi. 13 and xxxi. 13; xxxv. 15 and xxxv. 14, and numerous other instances). It is probable that the present book was a slow and gradual growth; and that the process may have been carried on to a very late date is shown by the considerable variations between the Masoretic and Septuagint texts.

For a good account of the Book of Proverbs, with reference to the literature of the subject, see Reuss, Gesch. d. heil. Schriften Alters Testamentes (1890). The most convenient commentaries are those of Hitzig (1858), Bertheau (1847; new ed. by Nowack, 1883), and Delitzsch (1873; Eng. trans.). See also The Speedwell's Commentary, and a homiletical work by Horton (1891).

Providence, a seaport and the semi-capital of the state of Rhode Island, the second city of New England and the twentieth in order of population in the United States, is situated at the head of navigation on an arm of Narragansett Bay, known as Providence River, 35 miles from the ocean and 44 miles by rail SSW. of Boston. It covers a wide area on both sides of the river, which, above its two bridges, expands into a cove, a mile in circuit, on the borders of which is a handsome park, shaded with noble elms. It is a city of large commerce, manufactures, and wealth, abounding with beautiful villas and gardens. Founded before the colonial type of American cities had been discovered, it has street plans peculiar to the site singularly uneven, rising in one place to 204 feet above high-water; and in one ward, much of which is still in farms, there are numerous hills and valleys. Among the many notable public buildings are institutions of Providence and the city hall, of granite, which cost upwards of $1,000,000, and has facing it the state's soldiers' monument; the state-house; the custom-house and post-office; the Athenæum, and the buildings of the Rhode Island Historical Society; the theatre and the Butler Exchange; a great number of churches, schools, and libraries, hospitals and asylums, including a noble charity known as the Dexter Asylum for the Poor; the Friends' Boarding-school (popularty, 'the Quaker College'); and Brown University, a Baptist institution, founded in 1764, and amply endowed: it has about 300 students, and ranks among the leading colleges of the United States. The city has lost most of its foreign trade, but instead it has become one of the great manufacturing centres of the country; two small rivers afford abundant water-power. The chief establishments are engaged in making engines, locomotives, corsets, and American woolens, cottons, and woollens, cheesecakes, shoe-laces, lamp-wicks, &c.; and besides there are scores of manufactories of jewellery, many bleaching works, &c. Providence was settled in 1636 by Roger Williams, Pop. (1870) 65,904; (1880) 104,857; (1890) 132,146; (1900) 175,597.

Province (Lat. provincia), a territory acquired by the Romans beyond the limits of Italy, and governed by a Roman Procurator (q.v.) or procurator, or by a proconsul (see CONSUL). The senate decided which provinces were to be praetorian and which consular. As a rule the provinces were unmercifully plundered by the governors and the tax-collectors (publicani). Under Augustus there were twelve imperial provinces, requiring military occupation, and under the emperor's immediate control, and ten senatorial provinces, entrusted to senatorial governors (see SENATE). The provinces of France (q.v.) were superseded at the Revolution by the departments. The great governmental divisions of India, Canada, and other countries are often entitled provinces. The sphere of duty of an Archbishop (q.v.) is his province, usually consisting of several ecclesiastical dioceses. The cathedral provinces of France (q.v.) were superseded at the Revolution by the departments. The great governmental divisions of India, Canada, and other countries are often entitled provinces. See General, Monachism.

Provin, a town of France (dept. Seine-et-Marne), lies 15 miles S.E. of Paris, on the remains of ancient walls, and overlooking the Banks of the Marne. The most interesting feature is an ancient tower, built in the 12th century, vulgarly called Caesar's Tower. The vicinity was long famous for its roses, and they are still cultivated to a considerable extent. There are numerous flour-mills and dye-works. Pop. 7888.

Provisional Order is an order granted, under the powers conferred by an act of parliament, by a department of the government, by the Secretary of State, or by some other authority, whereby certain things are authorised to be done which would be accomplished otherwise only by an act of parliament. The order does not receive effect, however, until it has been confirmed by the legislature. Till that time it is purely provisional; and even after it has been so confirmed and is in reality...
an independent act, it retains the title of a provision order. Provisional orders are most useful in facilitating the modification or extension of the provisions of general acts, so as to adapt them to the special necessities of particular districts. They may be obtained with much greater expedition and less cost than a private bill; the confirmatory act when adopted may be obtained in a week or two, and has all the facilities of a government measure.

Provisors, Statute of. The object of this statute, passed in the reign of Edward III. (1350), was to correct and put an end to the abuses which had arisen in the exercise of the patriarchal prerogatives as to the disposal of benefices in England. See England (Church of), Vol. IV. p. 337.

Provo City, capital of Utah county, Utah, is on the Provo River, between Utah Lake and the Wasatch Mountains, and 46 miles by rail SSE of Salt Lake City. It contains flour-mills, tanneries, &c. Pop. (1900) 6185.

Provoest (Lat. prepositus, 'set over'), in Church Law, the chief dignitary of a cathedral or collegiate church, who may use the title of provost, and who may also be transferred to the heads of other bodies, religious, literary, or administrative. The name is also given to the superiors of certain religious houses of lesser rank, and the relation of which to the more important houses is analogous to that of the provost to the abbey. The head of a cathedral chapter was anciently the archdeacon. Present, in the Roman Catholic Church, cathedral chapters are presided over by provosts in Austria, Prussia, Bavaria, and England, but in other parts of Germany and in France by deans. In the latter case, the provost is the Dean, i.e. the chief officer of a cathedral; but the title of provost survives, alongside that of dean, in the Scottish Episcopal Church. In the Protestant Church in Germany, in the north especially, where several minor churches or chapters are attached to one chief church, the minister of the latter is called provost (profeet). In England the heads of Oriel, Queen's, and Worcester colleges in the university of Oxford, and the head of King's College, Cambridge, are designated provost. The head of Eton College is also so called.

Provoest-marshal, in the Navy, is a person appointed to have charge of a prisoner before a court-martial, and until the sentence of the court is carried into execution. In the British Army the provost-marshal is an officer, appointed only abroad, to superintend the army. The head of the army category of any particular camp or district. He has cognisance of all camp-followers, as well as members of the army. Under the Army Act of 1881 he cannot as formerly inflict any punishment of his own authority, but may apprehend a offender and bring him before a court-martial. It may then be his duty to see the sentence of the court carried out.

Proxy (contracted for Procuracy), the agency of one person who acts as substitute for another. Every member of the House of Lords was formerly permitted, on obtaining a nominal license from the crown, to appoint another lord of parliament his proxy to vote for him in his absence. Only a spiritual lord could be proxy for a spiritual lord, and a temporal for a temporal lord, and no peer could hold more than two proxies at the same time. Proxies were never used in judicial business, or in committees of the House, nor could a proxy sign a patent. The practice of submitting proxies was discontinued in 1867. Shareholders in joint-stock companies may vote by proxy. Formerly, principal persons were sometimes, for reasons of state or convenience, represented by deputy at their own marriages; but marriage by proxy is not recognised by the law of England. See Marriage, Vol. VII. p. 58.

Prudentius, Marcus Aurelius Clemens, the most important of the Roman Christian poets, was born in the north of Spain in 348 A.D. Nothing is known regarding him except what he has himself told in a poetical autobiography prefixed to his works. From this we learn that he received a liberal education, practised as a pleader, discharged the functions of civil and criminal judge, and was ultimately appointed to a high office at the imperial court. His religious convictions came late in life, and he devoted the evening of his days to the composition of religious poetry. The year of his death is fixed at 398 A.D. Of his poems the chief are (1) Cathemerinon Liber, a series of twelve hortatory hymns, the first half for the different hours of the day, the latter half for different church seasons (Eng., trans. 1845); (2) Peristephanon, a collection of fourteen lyric poems in honour of martyrs (Eng., trans. 1845); (3) Apophthegmata, a defence of the doctrine of the Trinity against heretics; (4) Hamartigeneia, on the Origin of Evil, a polemic, in verse, against the Marcionites; (5) Psychomachia, on the Triumph of the Christian Graces in the Soul of a Believer; (6) Contra Symmachum, the first book a polemic against the heathen gods, the second against a petition of Symmachus for the restoration of the altar and statue of Victory cast down by Gratian; (7) Diaryon, a series of forty-nine hexameters, arranged in four verses, on scriptural incidents and personages. Bentley calls Prudentius 'the Horace of the Christians,' and others of the Latin poets, yet he be true enough if the critic only meant to say that he is the first of the early Christian verse-makers. See the article HYMN, Vol. VI. p. 46.

Editions are by F. Areval (Rome, 1788), reprinted in Migne's Patrologia, i. 532; Oebler (Fulbing, 1845); and Dressel (Leip., 1860). See Brehm, A. Prudentius (1872); Ebert, Geschichte der christl.-latein. Lnt. (vol. I, 1874); Pagner, De A. Prudentii Clementii Carmina, legis et alia (1885); and F. St John Thackeray, Translation from Prudentius (1886), with an excellent introduction to his life and works, language, metre, and style.

Prunella. Skeat defines this material as 'a strong woolen stuff, originally of a dark colour,' Vr. prunell, 'a sloe,' whence prunella in a Latinised form, now this word is chiefly from Pope's fine lines (Essay on Man, iv. 204): 'Worth makes the man, and want of it the fellow.' The rest is all but leather or prunella.

To which passage, in the Globe edition, Mr Ward adds 'because clergymen's gowns were often made of this kind of stuff.'—The name Prunellc is also given to a genus of plants of the natural order Labiatae. Several species are natives of Europe; one only is found in Britain, P. vulgaris,

PRUNES
are dried fruit of the plum-tree (Prunus domestica), of the variety called Juliana, largely prepared in France, and exported thence. Great numbers come also from Bosnia and Servia.

Pruning, the removal of branches from fruit or forest trees, in order to the greater production of fruit, the improvement of the timber, or purposes of ornament. In pruning for ornamental purposes, the tangles must he consulted, but reference must be made to what has been too little regarded in pruning of every kind—the nature or habit of the tree itself.

Some trees will bear clipping into fantastic forms, which would be utterly destructive of others. Such forms, once esteemed, are the most ornaments of a pleasure-ground, or the neighbourhood of a mansion, are rejected by the simpler taste of the present age, and the 'topiarist art' has few admirers. Much may be done, however, by the removal of branches to give a finer form to ornamental trees; but in the largest of the oaks, and of evergreen trees, of any apt of their timber, a great mistake is very generally committed in permitting branches to grow to a considerable size before they are cut off. It may be accepted as a general rule that the branches removed should be small in proportion to the bulk of the tree. The removal of twigs and small branches is attended by no bad effects, and may be beneficial; but the removal of large branches is dangerous. The leaving of stumps or snags is an aggravation of the evil. They rot away and spoil the timber of the stump; indeed, a hole is not an
frequently formed, which may eventually lead to the rotting of the whole of the interior of the trunk of the largest oak. But in the case of forest trees pruning may with advantage be in great part avoided, by taking care to plant at proper distances, and thinning out the plants sufficiently in early periods of their growth. In this way better timber is obtained and a greater produce from the land.

Pines and firs scarcely ever require pruning, and are probably in almost all cases the worse of that which they get, except in the removal of diseased lower branches. In other trees it is sometimes of importance to watch for branches that would divide the trunk, and to prevent the division, causing the main stem to ascend higher before it forms a crown; but to be of any use this must be done whilst the branches are still very young. Plantations should therefore be examined with a view to pruning, at intervals of not more than two years, after they are six or eight years old.

In orchards and fruit-gardens pruning is necessary, the object being not to produce timber, or the utmost luxuriance of trees, but fruit in the greatest perfection and abundance. The habits of each kind must be studied. Even in the pruning of gooseberry and currant bushes regard must be had to natural diversities, the gooseberry and black-currant produce fruit chiefly on spurs from older branches, and so is it amongst trees; apricots, for example, producing fruit chiefly on young wood, cherries mostly on spurs, whilst plums produce both in the one and in the other.

The object of the gardener in pruning is to bring the tree into the condition best suited for producing fine fruit and in the greatest abundance; and to this the training of wall trees must also be accommodated. Sometimes, in order to produce particularly fine fruits for the improvement of the variety by seed, or for the sake of a prize at a horticultural exhibition, the gardener diminishes the number of branches likely to bear fruit beyond what would otherwise be desirable.

The general seasons of pruning are winter and spring; but some trees, particularly cherries and all other drupeaceous fruit trees, are advantageously pruned in summer, as they then throw out less gum.

Pruning instruments are of various kinds—knives, axes, saws, bills of very various forms, &c.; and the averrucator, which may be described as a pair of scissors, one blade hooked or crooked, attached to a long handle, and working by a cord and pulley. It is scarcely except for standard trees in gardens and orchards.

Prurigo is the name applied to a group of diseases of the skin, characterised by the presence of papules, scarcely distinguishable in colour from the normal skin, and so 'felt rather than seen,' accompanied by intense itching. One form of the disease, prurigo scabies, is met with in old people in consequence of the irritation caused by lice, and disappears when these are got rid of. In its most characteristic form, however, it almost always begins in childhood, and may persist through life; even when the irritation of the lice is got rid of it, it is apt to recur. It chiefly affects the trunk and extensor surfaces of the limbs, and is worst in winter.

The disease is aggravated by the scratching from which the sufferer cannot refrain, and the skin becomes thickened and often ecaenomatous as well. Warm baths and soothing ointments are the good feeding, cod-liver oil, and arsenic or quince are generally found to give great relief, and often cure the disease entirely.

PRUSSIA (Ger. Preussen), by far the largest and most important state in the German empire, is a kingdom embracing nearly the whole of northern Germany. It is bounded N. by the German Ocean, Jutland, and the Baltic; E. by Russia (and Russian Poland); S. by Austria, Saxony, the Thuringian states, Bavaria, Hesse-Darmstadt, and Alsace-Lorraine; W. by Luxemburg, Belgium, and the Netherlands. Prussia owns lies in Hessen, Holstein (q.v.) and about thirteen other smaller exclaves or detached territories lying within the bounds of other German states. The total area is 136,000 sq. m. with (1885) 31,855,123 inhabitlants—i.e. nearly two-thirds of the entire German empire, with about one-third of the population, equal to about one and one-tenth the size of the United Kingdom, or one-half of the state of Texas. The frontier line has a circumference of 4720 miles, of which 1025 miles are coast-line (770 miles on the Baltic, 255 miles on the German Ocean). The following are the provinces into which Prussia is divided:

Omitting Berlin and Hildigrad, the density of population ranges between 181 (1868 Prussia) and 452 (Rhenish Prussia) per sq. m. About one-fifth of the present area of Prussia has been acquired
since 1833, the largest grains being made after the war of 1812. The peninsula, more than two-thirds of its total area, belongs to the north European plain, while less than a third, chiefly in the south-west, can be described as hilly or mountainous. The division between the two districts is roughly indicated by an irregular series of heights beginning with the Harz Mountains, then the Hunsruck, the Ems, and the Weser Hills, on both sides of the upper Weser, and thence running towards the south-east in the Harz Mountains (q.v.), with the Braecken (3740 feet), and in the northern outliers of the Thüringerwald (Finstenberg, 3100 feet; Inselsberg, 3000 feet). Further to the south-east this line of heights is continued by the Riesengebirge (q.v.), separating Prussian Silesia from Bohemia, and forming the northern ranges of the Sudetic system. None of these ranges rise above about 5000 feet; the Schneeckuppe (3290 feet) in the Harz Mountains, the Hohe Gaisberg, 3000 feet, in the Thüringerwald, and the Hunsruck, with an average height of 1200 to 1500 feet, and farther south is the Harz, the latter of which is given to the northern extremity of the Vosges. On the east side of the Rhine the Saarland, between the Ruhr and the Sieg, with the Rothaar or Rotlagergebirge, is succeeded farther south by the Westerwald (Fuchskaften, 2155 feet), between the Sieg and the Lahn, and by the Taunus (Feldberg, 2853 feet), between the Lahn and the Main. To the south of the Taunus, famous for its mineral springs, lies the fertile Rhine valley, and while to the north of the Vosges, chiefly, however, in Hesse, forms a link with the Hohe Rhön (Wasserklippe, 3115 feet), which may be regarded as an outlier of the Thüringerwald. The soil is generally poor in these districts, though they possess special sources of wealth in their iron and coal mines. The level country between the Rhine and the Maas, bordering the Eifel, is, however, extremely fertile; and Hesse-Cassel is particularly fruitful, cereals of all kinds growing abundantly. The great northern plain, which occupies the rest of the kingdom, is varied by the numerous lakes, especially in the east, on which the Oder, Bóbr, and other rivers of the district are described under GERMANY (Vol. V. p. 172). The surface is diversified with numerous lakes, especially in the east, on what are known as the Pomeranian and East Prussian Lake-plates, but none of them is more than 20 sq. m. in area, though altogether the number of these covers more than 600 sq. m. in area. The soil, consisting chiefly of loose sand interspersed with a large number of erratic blocks of granite, is sterile, covered in many places with heaths and belts of stunted pines. On the northern slope, terminating on the shores of the Baltic, there are numerous lakes, many of them small, along both rivers which have been carefully embanked, as the Niemen and the Vistula. The southern elevation of the Prussian plain, running between the Polish mountains of Sandomir in the south-east and the

Elbe between Magdeburg and Bamburg in the north-west, attains a height of about 1000 ft. above the Breslau on the Oder, where it is known as the Teubnitz Heights. Its general character is more fertile than the northern elevation; while the country between the two is, for the most part, extremely sterile. It includes the sandy waste in which Berlin, the capital, is embedded, Situated on this tract, and in Silesia and Prussian Saxony, the country is fertile, including some of the most productive grain-growing districts of Prussia. Hanover has much the same character. Great marshes or peat-moors cover the north and north-west districts; but the chief rivers, the Oder, Vistula, and Weser, and their tributaries, which flow in the south are often fertile, and well adapted for agriculture. The coasts are low, and require to be protected from the overflowing of the sea by embankments and dykes. Sleswick-Holstein, to the north of the Elbe, is in part sandy and heathy, like the plain of Hanover, but it has also numerous marshes.

Rivers.—The northern plain is watered by five large rivers—the Niemen, Vistula, Oder, Elbe, and Weser—all of which rise beyond the borders of the kingdom, and the Pregel, Elder, and Ems, which are exclusive to the kingdom and enter it from Prussia. The chief river is the Rhine, which enters Prussia at Mainz, and thence flows north through a narrow valley noted as one of the most picturesque parts of Germany. The Rhine, which is navigable throughout its entire course in Prussian territory, receives numerous tributaries—such as the Lahn, Wied, Sieg, Wupper, Ruhr, Lippe, Berkel, and Vechte, on the right, and on the left the Air and the Moselle or Mosel, the latter of which is navigable for more than 150 miles within the Prussian dominions. The Weser, Elbe, Oder, and Vistula, as also the Sorce and Spree, are navigable, receiving, however, a great part of their water from the chief rivers of north Germany, the most important are the Bromberger, the Finow, the Friedrich-Wilhelms, the Elder, and the Kaiser-Wilhelm canals.

Climate.—The climate of Prussia presents great differences in the eastern and western provinces, the former being exposed to heavy snowstorms in winter and great drought in summer, while the latter have milder winters and a greater rainfall. At Berlin the annual mean temperature is 48° F.; on the Rhine it is 49° (summer, 63°; winter, 34°); in the east provinces and among the mountains it is below 45° (summer, 61°; winter, 28°).

Productions.—Agriculture and the rearing of cattle constitute the principal sources of employment and wealth of the rural population of the entire monarchy, and the state has hitherto directed its unremitting attention to the furtherance of the one and the encouragement of the other. It has endeavored to discourage land-taxes, advancing money to landowners, encouraging agricultural institutions, introducing approved breeds of animals and improved farm instruments, &c. Rather less than one-half, or 12,000,000, of the population of the kingdom are engaged in agriculture. The most important crop is wheat, which covers more than 3000,000 acres. Of the total area 50 per cent, is occupied by arable land, 94 per cent, by meadows, and 11 per cent, by pasture. Large estates, as a rule, are only to be found in the eastern and least populated provinces of the monarchy. Rye, wheat, oats, barley, peas, maise, and other grain are almost everywhere extensively cultivated. The finest grain districts are the Börde, near Magdeburg, the low lands on the Wartha and Netze, and on the Rhine and Mulde.
lakes, the north-eastern parts of Pomerania, the island of Rügen, the valleys of the Oder in Silesia, of the Saale, Moselle, Saar, and parts of Hesse-Nassau. Magdeburg is the centre of the beet-root sugar industry. Western Prussia is noted for its excellent fruits and vegetables, and its provinces stand pre-eminent for their wines, Nassau being specially famous for its Rhine wines. The forest lands, which are chiefly in East Prussia, Posen, Upper Silesia, Westphalia, Southern Hanover, and Hesse-Nassau, are of great value and considerable extent, occupying an area of 10,000,000 English acres. The mineral products of Prussia include coal, iron, lead, zinc, copper, cobalt, antimony, manganese, arsenic, sulphur, alum, nickel, black lead, baryta, gypsum, slate, line, freestone, salt, amber,agate, jasper, onyx, &c. Prussia yields about one-half of the annual zinc production of the world; and of the total output of coal in Germany, about three-eighths of that of the United Kingdom, Prussia produces 93 per cent. The chief coalfields are in Silesia, Westphalia, and Rhenish Prussia, which are at the same time the chief industrial and mining kingdom of the empire. The region of the Harz in Hanover is also famous for its mining industries. All metals, salt, precious stones, and amber found along the Prussian coast from Danzig to Memel belong to the crown. Prussia has unimportant deposits of copper, for which the iron-ore and efficient are the sulphur baths of Aix-la-Chapelle and Ems; the iron springs of Schwabach, Willemsbad, Driburg, and the hot and saline baths of Reinerz, Landeck, Flinsberg, Freienwalde, Lauchestett, Wiesbaden, Schlangenbeul, and Freiburg. Iron ore is used for its royal studded, and the excellent breed of horses which it now raises, and of which large numbers are annually exported. Westphalia enjoys a special reputation for the excellence of its hams and pork, Pomerania for its smoked geese, and Brandenburg and Hanover for honey and wax. Fish of all sorts are abundant in the rivers and numerous lakes; seals are taken in the Baltic. The wooded districts abound in game of every kind, pheasants, partridges, and wild geese being often found in enormous quantities. The fur-bearing animals are wildcats, foxes, eroters, weasels, polecats, martens, badgers, hares and rabbits, the lynx, bear, eagle, and beaver are occasionally met with.

Manufactures.—The principal manufactures are linens, for which certain districts in Prussia, especially Saxony, and Brandenburg enjoy a European celebrity; while of late years the cotton manufactures, worked by steam, have maintained a successful rivalry with the older linens, worked by hand-looms. Besides these there are numerous manufactories of silk, wool, mixed cotton and linen fabrics; including fine shawls and carpets in Brandenburg, stockings and ribbons in the Rhenish provinces, where, as well as in Westphalia and Hesse-Nassau, the flax, hemp, and silk and cotton thread is mainly prepared for the manufacturers. These districts, moreover, stand foremost in regard to the preparation and manufacture of iron, steel (the steel and gun works of Krupp, at Essen, being world-famous), and other metallic wares, paper, leather, soap, oil, cigars, and tobacco, and for the number of their glass works. Saxony and Silesia have the largest number of chiocory, starch, beet-root, gunpowder, and glass works. Berlin and Elberfeld rank as the two most important centres of manufacture on the Continent. In 1893-94 there were 316 beet-root sugar factories in Prussia, which produced 1,901,000 tons of raw sugar. In 1894 the total value of the minerals produced in the kingdom was 576,679,725 marks (of which nearly two-thirds came from the Rhine-land and Westphalia); while the mineral produce of the German empire was only 675,000,000 marks.

Commerce.—The commerce of Prussia is materially facilitated by her central European position, and the network of river and canal navigation, which makes her commerce with the interior in several of the great European states, and which, with (1895) 17,486 miles of railway, 40,500 miles of public roads (all, or nearly all, formed since the time of Frederick the Great), and a coast-line of 1000 miles, gives her a free outlet to the rest of the world. The Prussian merchant fleet consists of nearly 2,255 vessels of 354,213 tons. The chief ports are Memel, Pillau, Königsberg, Danzig, Colberg, Swinemünde, Stettin, Wolgast, Stralsund, Kiel, Flensburg, Altona, Harburg, Geestemünde, Leer, and Emden. The principal commercial towns are Berlin, Königsberg, Breslau, Bautzen, Elberfeld, Danzig, Posen, Stettin, Cologne, Magdeburg, Aix-la-Chapelle, and Frankfort-on-the-Main. Annual fairs are still held at Breslau, Magdeburg, and Frankfort-on-the-Oder.

The number, measure, and weights of Prussia are those in force throughout the German empire. In accordance with the law of 1872 the mark is the unit of reckoning, and has gradually displaced Thalers (q.v.) and silbergroschen. The Prussian or Berlin Bank, founded in 1765, with numerous branches in the provinces, is the most important of those banks which possess the right of issuing notes.

Religion, &c.—The dominant religion is Protestantism, and since 1817 the Lutheran and Reformed Churches have been united under the head of one bishop, the General Superintendent of the Prussian Church, who is connected with the external administration of church matters, is under the control of the minister of public instruction and ecclesiastical affairs, but every religious community manages its own internal concerns; the Protestant churches acting in conjunction with ecclesiaries or boards appointed by the government, one of which exists in each province, under the direction of the upper president, or provincial governor, and a clerical superintendent-general, who in Posen and Pomerania bears the title of bishop. The Prussian church is directed by the two archbishops of Posen and Gnesen, and Cologne, under whom stand the four bishoprics of Culm, Münster, Paderborn, and Treves. The four episcopal sees of Breslau, Ermland, Osnabrück, and Hildesheim are directly controlled by the ministry. The Roman Catholic Church is directed by the two archbishops of Cologne and Gnesen, under whom stand the four bishoprics of Culm, Münster, Paderborn, and Treves. The results of the census of 1885, as regards the numbers of the religious bodies, are as follows: the Protestants of Prussia numbered 18,244,405 (64·4 per cent. of the pop.); Roman Catholics, 9,621,763 (33·9 per cent.); Jews, 366,575 (1·29 per cent.). Roman Catholics are most numerous in Hohenzollern (93 per cent.), Rhenish Prussia (72 per cent.), and Posen, Silesia, Westphalia, and West Prussia. The higher Roman Catholic clergy are paid by the state, the parochial clergy chiefly by endowments. For the Kultur-kampf, see the article GERMANY, Vol. V. p. 183.

Education.—Education is compulsory in Prussia between the ages of 6 and 14; there is an Act for the fourteen, and its management and direction are under the control of the state. In no country are better or ampler means supplied for the diffusion of knowledge among all classes of the community. Prussia has ten universities, Königsberg, Berlin, Breslau, Halle, Göttingen, Münster, Bonn, Kiel, and Marburg, which in 1889-90 numbered above 1240 professors and teachers and 15,770 students. The educational system has already been described
under Germany, Vol. V. p. 176. In 1896 there were in Prussia 36,000 elementary schools, with 82,300 teachers and 5,290,820 pupils. The management of 300,000 voluntary national schools is in the hands of the local communities; but the state appoints the teachers, and in part pays their salaries, the remainder being supplied by the public. In addition to the libraries of the several universities there is the Royal Library at Berlin, with 500,000 volumes and about 15,000 MSS. Among the numerous scientific, artistic, and literary schools and societies of Prussia the following are some of the more distinguished: the Academy of Arts, founded in 1700; the Royal Museum of Arts; the Academy of Sciences; the Natural History, Geographical, and Polytechnic Societies of Berlin; the Antiquarian Society of Stettin; the Breslaw Natural History and Historical Societies; &c.

Justice.—Till lately the Code Napoléon was in force in the Rhenish provinces, and in Hither-Pomerania the common German law; but in other parts of the kingdom the Prussian code, compiled under Frederick the Great's direction, was followed. A new penal code was promulgated in 1850, by which all pre-existing seigniorial, municipal, or ecclesiastical rights of decreasing punishments were undermined or abrogated. A new constitution was brought about in 1862, and in 1869 a code of commercial law valid for the North German Confederation. Since the establishment of the empire, the law has preponderance of that peculiar to the various states in a large number of subjects. Universal criminal and commercial codes are now in force for the whole empire, and a universal civil code has been prepared. A common judicature bill for the empire was passed in 1879. Prussia has sixteen Oberlandesgerichte or provincial courts, one or more in each province. Connected with that sitting at Berlin is the Privy-council of Justice, which has jurisdiction over the royal family and the princely houses of Holstein-Lolland.

The supreme tribunal of the empire has been established, not at Berlin, but at Leipzig, in Saxony.

Army, Navy, &c.—In 1890 the strength of the Prussian army was 1,376,500 men, 65,200 police, and 1,005,099 officials. The official returns, numbered 453,000, of whom 53,000 were cavalry and 64,000 artillery. The army consists of the regular troops and the Landwehr (q.v.), and in time of war an extra force can be called up under the title of the landstorm. Every able-bodied male Prussian is liable to be called upon to bear arms between twenty and thirty-nine years of age (see Germany). Clergymen of the Roman Catholic and Evangelical churches and indispensable supporters of families are exempt. Great care is bestowed on the education and military training of officers and men; and, besides numerous admirable academies, there are several good schools of operative and veterinary surgery, &c., connected with the educational department of the army. The navy of the new German empire is the navy of Prussia. See Germany.

Constitution, &c.—Prussia was an absolute monarchy till the crisis of 1848, when the decided movement in favour of liberal views compelled the king to convocate a national assembly, and submit to the establishment of a constitutional form of government, which he was bound to accept. The national representative body consists of two bodies: (1) an upper chamber (Herrenhaus, or House of Lords), which is now composed of the princes of the royal family who are of age, the chiefs of the mediatised princely houses recognised by the Congress of Vienna, and the Senate; (2) a lower chamber (Abgeordnetenhaus, or Chamber of Deputies), composed of 422 members, 332 for the old kingdom and 80 for the provinces annexed in 1867. Every Prussian who has attained his twenty-fifth year, and who has a municipal vote, has also a parliamentary vote, but not a direct one. Out of every 250 Urienhiiler, or electors in the first instance, is chosen a Wahlmänn, or direct elector. This is the man who, strictly speaking, votes for a member of parliament. Representatives are elected for five years, and each receives twenty marks per diem, the refusal of which is illegal. In addition to this general house of assembly there are representative bodies for the provinces, communes, and circles, which debate and legislate in regard to local matters within their several departments. The executive council of state is composed of eleven ministers appointed by the king, and holding office without reference to the comparative strength of political parties. The president of the council has a salary of £27,000, and a private income of £4800 arising from the sale of rents, whilst the modified constitution of 1850 all exclusive privileges arising from titles or station are abrogated, and perfect equality in the eye of the law fully recognised; liberty of the subject guaranteed in regard to religious persuasion, the right to hold meetings unwarmed within closed doors, and become members of societies; immunity from domiciliary visits, and inviolability of letters, &c. The monarchy is hereditary in the male line. The sovereign and royal family must profess the evangelical confession of faith. The king, who is not responsible for the measures of his government, and whose decrees require the counter-signatures of his ministers, exercises the executive power, nominates and dismisses the ministry, summons and dissolves the chambers, orders the promulgation of the laws, is commander-in-chief of the forces, has the right of presenting bills to parliament, &c. He bears the titles of King of Prussia, Markgraf of Brandenburg, Sovereign-duke of Silesia, Prince of Orange, Grand-duke of Pomerania and the Lower Rhine, besides a host of lesser titles. The title 'German Emperor,' by which he is now best known, is conferred on him as the son-in-law of the eldest son of the crown bears the title of Crown-prince. The ordinary royal residences are the palaces at Berlin, Potsdam, and Charlottenburg. The royal domains were ceded to the state by Frederick-William III. in 1820, on condition of a rental of 2½ million thalers being paid first from them to the king and his family, which, however, has been increased in 1859, 1868, and 1880 by means of a Kronobitation (crown-allowance) to £770,550.

In the year 1898-99 the budget-estimate of the receipts was 2,187,527,384 marks ($520,631,547), just balanced by the expenditure. The total national debt bearing interest was 6,483,222,000 marks ($1,543,482,836), or about 148.50 per head of the population. The direct taxes are an income-tax, land-tax, tobacco and spirit excise, religious and mortality tax, and amount to about 8s. 6d. per head. The income-tax yields about 1s. 5d. per head of the population.

Population, Races.—About seven-eighths of the population of Prussia are Germans. Of the Slavonic tribes the Poles number upwards of 5,400,000, and the Buriats 600,000. In Brandenburg and Silesia there are about 85,000 Wends; in East Prussia, upwards of 150,000 Lithuanians; Western Prussia has rather
more than 10,000 Walloons, using the French language; intermixed in its generally German population Silesia has 55,000 Czechs or Bohemians; Sileswick-Holstein, 140,000 Danes—making in all about 3 millions who do not use the German language, or who employ it only as secondary to their mother tongues.

Ranks, Classes.—Three distinct hereditary classes are recognised in Prussia—viz., nobles, burghers, and peasants. To the first belong nearly 200,000 persons, including the higher officials of the state, although that number does not comprise the various magic to convert the Teutonic knights and others belonging to different states, but connected with Prussia by still existing, or former territorial possessions. The burgher class includes, in its higher branches, all public office-bearers, professional men, artists, and merchants; while the peasantry—to which belong all persons engaged in agricultural pursuits—are divided into classes, depending on the number of horses employed on the land, &c.

History.—The lands bounded by the Baltic, which now form part of Prussia, were early occupied by the heathen; a religion for them was brought by the Lithuanians. It is conjectured that they were visited by Phoenician navigators in the 4th century B.C.; but, beyond the fact of their having come into temporary conflict with the Goths and other Teutonic horde prior to the great exodus of the latter in their flight from their enemies, nothing is known of the people till the 10th century, when they first appear in history under the name of Borussi, or Prussians. In 997 Bishop Adalbert of Prague suffered martyrdom at their hands while endeavouring for the conversion to Christianity. Boleslaus I, Duke of Poland, succeeded, however, in 1018, in compelling them to submit to baptism and subjection. After many futile attempts on the part of the people to throw off the yoke of Christianity and foreign domination, they finally made a successful stand against Boleslas IV, of Poland in 1161, and for a time maintained a rude and savage kind of independence, which the disturbed condition of Poland prevented its rulers from breaking down. The fear of losing their freedom if they adopted Christianity made the Prussians obstinately resist every attempt to convert them to Christianity; it was not till the middle of the 13th century, when the knights of the Teutonic order began their 'famous' crusade against them (see TEUTONIC KNIGHTS), that the Christian faith was established among them. The introduction of the pagan Prussians on the territories of their Christian neighbours, and their advance into Pomerania, was the exciting causes of this important movement. The knights of the order, when appealed to by Conrad, Duke of Masovia, to aid in the subjection of the heathen, gladly promised their services on condition of being permitted to retain possession of the lands which they might conquer; and, having entered the Prussian territories in considerable numbers, they entrenched themselves in Vogelsang and Nossen in 1259, and at once entered upon the conquest of Prussia in the half a century, the belligerent brotherhood were engaged in war with the people—winning lands and souls by hard fighting—until at length in 1283 they found themselves undisputed masters of the country, which they had both civilised and Christianised after a fashion—that is to say, by exterminating the pagan population.

During this period of struggle the knights founded the cities of Thorn, Kulm, Marienwerder, Memel, and Königsberg, repeopled the country with German colonists, encouraged agriculture and trade, and established in it the foundations of a strong and prosperous state. The unhappy war between the knights and the Poles and Lithuanians, together with the moral degeneracy of the order, led, in the 14th and 15th centuries, to the decline of their supremacy. In 1454 the municipal and noble classes, with the co-operation of Poland, rose in open rebellion against the knights, who were finally compelled to seek peace at any cost, and obliged in 1466 to accept the terms offered to them by the Treaty of Thorn. But a new state which was founded, Prussia and Ermland were ceded by them unconditionally to Poland, and the remainder of their territories declared to be fiefs of that kingdom. In 1511 the knights elected as their grand-master the Markgraf Albert of Anspach and Bairleuth, a kinsman of the king of Poland, and a scion of the House of Hohenzollern family. Although his election did not immediately result, as the knights had hoped, in securing them allies powerful enough to aid them in emancipating themselves from Polish domination, it was fraught with important consequences to Germany at large, no less than to the order itself. In 1525 the grand-master was acknowledged Duke of Prussia, which was converted into a secular duchy (afterwards known as East Prussia), and renounced the Roman Catholic religion, likewise followed by many of the knights. The country made rapid advances under the rule of Albert, who improved the mode of administering the law, restored some order to the finances of the state, established schools, founded the university of Königsberg, and with the help of German printers translated into Polish, and several books of instruction to be printed in German, Polish, and Lithuanian. His son and successor, Albert Frederick, having become insane, a regency was appointed. Several of his kinsmen in turn enjoyed the dignity of regent, and finally in 1618 was crowned with the crown of Poland, in the person of his son, Sigismund, elector of Brandenburg, after having held the administration of affairs in his hands for some years, was, on the death of the duke in 1618, recognised as his successor, both by the people and by the king of Poland, from whom he received the investiture of the duchy of Prussia, which, since that period, has been governed by the Hohenzollern-Brandenburg House.

Here it will be necessary to retrace our steps in order briefly to consider the political and dynastic changes of the last hundred years. In 1344 the North Mark, afterwards called the Altmark, a district in the west of the Elbe and north-east of the Harz, was bestowed upon Albert the Bear of Luxemburg, who extended his dominion over the marshy region near Brandenburg and Berlin (the Mittelpark), and assumed the title of Markgraf of Brandenburg. During the next two or three centuries his immediate descendants advanced still further eastward, beyond the Oder into Farther Pomerania. On the extinction of this line, known as the Ascanian House, in 1539, a century of strife and disorder followed, until finally Frederick V., count of Hohenzollern, and markgraf of Nuremberg, became possessed, partly by purchase and partly by investiture from the Emperor Sigismund, of the Brandenburg lands, which, in his favour, were constituted into an electorate. This prince, known as the Elector Frederick I., received his investiture in 1417. He united under his rule, in addition to his hereditary Franconian lands of Anspach and Bairleuth, a territory of more than 11,000 sq. m. His reign was disturbed by the insurrection of the nobles and the constant incursions of his Prussian and Polish neighbours, but by his firmness and resolution he restored order at home and enlarged his boundaries. Under Frederick's successors the Brandenburg territory was augmented by the additions of various acquisitions, although the system of granting appanages to the younger members of the reigning
houses, common at that time, deprived the electorate of its original rank. The *Dispatio Achilles*, however, which came into operation on the death of the Elector Albert Achilles (1470–86), while it separated Anspach and Brandenburg, legally established the principle of primogeniture in both. The most considerable addition to the electorate was the one to which references has already been made, and which fell to the Elector John Sigismund through his marriage in 1609 with Anne, daughter and heiress of Albert Frederick the Insane, Duke of Prussia. In consequence of this alliance the duchy of Cleves, the countships of Mark and Limburg, and the extreme province of Pomerania, now known as East Prussia, became incorporated with the Brandenburg territories, which were thus more than doubled in area.

The reign of John Sigismund's successor, George-William (1619–40), was distracted by the miseries of the Thirty Years' War, and the country was alternately the prey of Swedish and imperial armies; and on the accession of George-William's son, Frederick-William (q.v.), the 'Great Elector,' in 1640, the electorate was sunk in the lowest depths of social misery and financial embarrassment. But so wise, prudent, and vigorous was the government of this prince that at his death in 1688 he left a well-filled exchequer, and a fairly-equipped army of 38,000 men; while the electorate, which now possessed a population of one and a half million and an area of 42,000 sq. m., had been raised by his genius to the rank of a great European power. His successors Frederick I. (q.v.; 1688–1713) and Frederick-William I. (1713–40) each in his own way increased the power and credit of Prussia, which had been in 1701 raised to the rank of a first kingdom. The Elector Frederick William I. was distinguished for his rigid economy of the public revenue and an extraordinary penchant for tall soldiers, and left to his son Frederick II. (q.v.), Frederick the Great, a compact and prosperous state, a well-disciplined army, and a sum of nearly nine million thalers in his treasury. Frederick II. (1740–86) dexterously availed himself of the extraordinary advantages of his position to raise Prussia to the rank of one of the great political powers of Europe. In the intervals between his great wars he devoted all his energies to the improvement of the state, increasing the revenue, commerce, and encouraging the military, financial, and judicial departments of the state. By his liberal views in regard to religion, science, and government he inaugurated a system whose results reacted on the whole of Europe; and in Germany more especially he gave a new stimulus to thought, and roused the dormant patriotism of the people. Frederick was not over-scrupulous in his means of enlarging his dominions, as he proved by sharing in the first partition of Poland in 1772, when he obtained as his portion nearly all West Prussia. He also took part in the other distributions of 1772 and 1795. His nephew and successor, Frederick-William II. (1786–97), aggravated his kingdom by the second and third partitions of Poland in 1793 and 1795. Frederick-William III. (q.v.; 1797–1840), who had been educated under the direction of his grand-uncle Frederick the Great, succeeded in 1797, at a time of extreme difficulty, when continental rulers had no choice beyond being the opponents, the tools, or the victims of French republican ambition. By endeavouring to maintain a neutral attitude Prussia lost her political importance, and fell into the hands of her overt enemies. But the calamities which this line of policy brought upon Prussia roused Frederick-William from his apathy, and, with energy, perseverance, and self-denial worthy of all praise, he devoted himself, with his great minister Stein, seconded by Count Hardenbergh, to the reconstruction of the state. In the years 1806-10 Prussia underwent a complete domestic reorganisation; and after the battle of Waterloo, which restored to Prussia much of the territory lost at the peace of Tilsit in 1807, the career of progress was continued. Trade received a new impulse through the conclusion of commercial treaties made with the maritime nations of the world, the formation of excellent roads, the establishment of steam and sailing packets on the great rivers, and at a later period through the organisation of the Zollverein (q.v.), and through the foundation of the Reichskammergericht, and the fruitful provision was made for the diffusion of education over every part of the kingdom, and to every class. In like manner, the establishment Protestant Church was enriched by the newly-inaugurated system of government subvention, churches were built, the emoluments of the clergy were raised, and their dwellings improved; but, not content with that, the king forcibly united the Lutheran and Reformed Churches in 1817, a high-handed act most fruitful in discontent and difficulties. This tendency to over-legislation has long been the predominating feature of William the Fourth's reign. He preferred the state, without regard to the incongruous elements of which it was composed, was divided and subdivided into governmental departments, which, in their turn, under some head or other, brought every individual act under governmental supervision, to the utter annihilation of political independence. The people soon perceived that this administrative machinery made no provision for political and civil liberty, and demanded of the king the fulfilment of the promise he had given in 1815 of establishing a representative constitution for the whole kingdom. The summoning of the Diet of Frederick William, illusory as the king, and its immediate fruits were strenuous efforts on his part to check the spirit of liberalism. Siding with the pietists of Germany, he introduced a sort of Jesuitical despotism, which was continued by his successor, Frederick-William IV. The Landstände or provincial estates, organised in accordance with the system of the middle ages, were the sole and inadequate mode of representation granted to Prussia in this reign, notwithstanding the pledge made to the nation for a full and general representative government. The accession of Frederick William, II. was attended with a better prospect to the friends of constitutional freedom. A political amnesty was proclaimed, religious toleration was announced, and a contest betwixt the crown and the pope, in which the first signs of the coming Kulturkampf may be traced, was brought to a close by concessions on the part of the king. Frederick-William, however, was an enthusiastic upholder of the divine right of kings, and it soon became apparent that he was in no way prepared to follow up his vague promises of political liberty by sharing political power with the people. The country became daily more and more irksome to the nation, and it was evident that a constitutional struggle was inevitable. The king and his advisers, underrating the importance of the movement of 1848 in Germany, thought they had satisfied the requirements of the time by the measures taken by his father, and by reforms and by making equivocal promises of future concessions. A collision betwixt the troops and the citizens of Berlin, in which blood was shed, awoke the king to the full gravity of the crisis, and he hastened to ally the general discontent by the nomination of a civic guard, and the summoning of a representative chamber to discuss the proposed constitution. The conversion of the monarch to liberalism was but temporary; and although, after
much obstruction, a constitution, superseding the old Prussian estates by a representative parlia-
ment, was promulgated in January 1850, it was repeatedly modified in the following years, until
a few of its democratic features were left. Frederik-
William had early distinguished himself and de-
ligned many, both within and without of Prussia, by his patriotic utterances in favour of a
new united Germany. He was deeply chagrined
when in 1848 the national assembly at Frankfort, in-
flienced by Austrian jealousy of the military strength of Prussia, declined to accept him as the
imperial head. Instead of the Archduke
John of Austria as lieutenant-general of Germany.
Yet, when in the following year he was offered the
imperial crown, he found himself unable to face
the responsibility of accepting it. He hesitated to
make so important a move in the contest with
Austria for the hegemony of Germany. The later
years of this reign were characterised by great
advances in the material prosperity and internal
improvement of the country. Extensive lines of
railway and post-roads were opened, the river
navigated, and trade relations with foreign coun-
tries formed, and a great expansion given to the Prussian and North German Zollverein
(q.v.), the army put upon a footing of hitherto
unprecedented efficiency of arms and artillery, and
the educational system of the country still further
developed. Frederick, son of the first German emperor in 1871, had been regent of
the kingdom since 1858, owing to the insanity of his
brother, the late king. William was no more a
lover of constitutional, or at least of popular,
liberty than any of his predecessors; and in his
opposition to the principles of the popular move-
ment, in so far as it aimed at interference with the
regal power, he was powerfully aided by his great
adviser Bismarck (q.v.), who became prime-minister
in 1862 and imperial chancellor in 1871. The
successful wars with Austria (1866 and France
(1870–71), which so enhanced the prestige of Prussia
and which resulted in the united Germany of to-
day, are described at GERMANY. Since the king
of Prussia became German Emperor the history of Prussia has been practically merged in the
history of Germany. After his death, his son
Frederick III. (March 9 to June 15, 1888), his son,
William II. (q.v.), ascended the throne. While still
adhering to the military policy of his grandfather, and still cherishing a more or less exalted belief
in the divine right of kings, the young monarch has
shown himself able to realise the importance of the
great social questions of modern times, and ready
to deal with them in a decided yet sympathetic
manner. The advanced, and in some respects
socialistic 'labor-policy' of the emperor, unfavored
at a labour-conference of representatives of the
great powers in Berlin 1890, and the abolition of
the anti-socialist laws led to the resignation by
Prince Bismarck of all his ministerial functions in
March 1890, as well in the kingdom as in the
empire; and no subsequent Prussian minister has
since exercised important powers. Various
minor reforms, including a new scheme of local
government and of communal taxation, occupied the
attention of the Prussian diet. A bill of 1891,
giving compensation for the suspension of salaries
of Roman Catholic clergy in Prussia during the
Kilburnkampf was the formal beginning of this
compensation bill and some anti-
socialist legislation provoked controversy. The
history of Prussia is now in the main but part of
the history of the Empire of Germany (q.v.).

RIK II., BISMARCK, &c., H. Tuttle, History of Prussia
(Boston, 1894–98); Godfrey de Casamiquel, Les Origines
de la Prusse Contemporaine (1899).

PRUSSIAN BLUE, the name given to sesqui-
ferrocyanide of iron, used as a colouring matter.
It was discovered in 1784 by Diesbach in Berlin
(whence it is also called Berlin Blue), and the
manufacture was kept a secret till 1724. See
BLUE; also DYEING, Vol. IV. p. 156.

PRUSSIC ACID, a name given to Hydrocyanic
Acid (q.v.), because it was first obtained from
Prussian blue.

Prutenic Tables, astronomical tables com-
piled in the 16th century, and so called because
based on the system of Copernicus, a Prussian.
They were corrected by Brade.

Pruth, a left-hand affluent of the Danube,
rises in the south-east of Austrian Galicia, on the
north-east side of the Carpathian mountains, and
flows eastward past Kolomea and Czernowitz ;
from the point at which it leaves Austrian territory
to its embouchure in the Danube at Reni, 13 miles
below Galatz, it forms the boundary between Russian Bessarabia and Romania. Length about
350 miles, nearby, 168 miles.

Prynne, William, born in 1600 at Swainswick
near Bath, from Bath grammar-school passed in
1616 to Oriel College, Oxford, and took his B.A.
in 1621. He entered Lincoln's Inn, and in due time
called to the bar, but was early drawn into the
vortex of ecclesiastical controversy, and during
the revolts 1627–30 published many tracts on
Health, Sickness (against drinking of healths),
and three other Puritan and anti-Arminian diatribes.
In 1633 appeared his Historia-Mastix: the Players
Sorgeyre, in whose index, on page 1164, occur the
words 'Women players notorious,' 'Some women players;' 'Six weeks after its publication Gabrietta Maria herself took part in a pastoral, so here was a reflection on
the queen's own virtue; and on 17th February 1634
Prynne was sentenced by the Star-chamber to a
fine of £5000, degradation from the bar, expulsion
from Oxford and Lincoln's Inn, the loss of both
ears in the pillory, and the shock to his vanity as
an author of seeing his book burned in public by the
hangman. He was, moreover, condemned to per-
petual imprisonment, and immured in the Tower
accordingly. Three years later the pertinacious
offender found some comfort in the publication of two more pamphlets, in which he fiercely assailed
the hierarchy, and was unsparing in his personal
abuse of Laud. For this he was once more pros-
ecuted; a fresh fine of £5000 was imposed on him;
he was a second time pilloried, losing such stumps
of ears as the hangman before had spared; and
he was branded on both cheeks with S. L. ('seditionis libellus'—rather 'stigmata Laudis' by Prynne's
interpretation). He was removed successively to
Lancaster, Carnarvon, and Mont Orgueil in Jersey,
and remained a close prisoner till in 1640—the Long
Parliament then sitting—he was released by a
warrant of the House of Commons, and a tumultu-
ous expression of popular sympathy celebrated his
restoration to liberty. He acted as Laud's bitter
prosecutor, leaving no stone unturned against his
old enemy (1644); and in 1647 became recorder of Bath, in 1648 member for Newport in Cornwall.
But opposing the Independents and Charles I.'s
execution, he was one of those of whom Cromwell
'pursued' the House of Commons, and was even
imprisoned (1659–62) in Dunster, Taunton, and
Pendennis Castle, Cornwall. Cromwell, not wishing
him to return to his place in parliament, bestirring himself in the royalist interest; and after the Restoration
Charles II. proposed to 'keep busy Mr Prynne quiet
by letting him write against the Catholics, and
pore over the records of the Church,' which
records account of Prynne was appointed keeper.
This did keep him fairly quiet until his death,
which took place at Lincoln's Inn on 24th October
1669. 'Voluminous Pryneum' Wood calls him; and the continuous stream of writings on the peripatetic topies of the day, which was always kept going, is the record of but a fraction of his literary activity. He was a great compiler of constitutional history, his most valuable works in this field being the Calendar of Parliamentary Write and his Records, both of which contain much that is useful and important.

See II. of Howell's State Trials; Documents relating to Pryneum, edited by S. R. Gardiner (Camden Society, 1877); and other works cited at CHARLES I. and LAUD.

Prytanenum, the town-hall of a Greek city, where the fire was kept perpetually burning, where ambassadors were received, where citizens who had deserved especially well of the state were sometimes allowed to live at the public expense; it was in fact the headquarters of the executive of the state. In Athens this body, the prytaneis, fifty in number, were chosen from the 500 members of the great council, five for each of the ten tribes. The five representatives of each tribe held office in rotation, one month at a time.

Przemysl, a town of Austrian Galicia, on an affluent of the Vistula, 61 miles W. of Leubourg by rail. It is the seat of a Roman Catholic and a United Greek bishop, carries on a considerable trade, and has manufactures of machinery, spirits, wooden wares, &c. Since 1874 it has been strongly fortified. Pop. (1890) 33,209, fully one-third Jews.

Psalmazar, George, 'the Formosa,' was born probably in Languedoc, between 1679 and 1685. Educated by monks and Jesuits at Avignon and elsewhere, he at sixteen turned vagabond, and for two or three years wandered through France, Germany, and the Low Countries, by turns an 'Irish pilgrim,' a 'Japanese convert,' a waiter, a 'hathood soldier,' and a soldier. At last, in 1710, he found in a ready accomplice in one Innes, chaplain to a Scottish regiment, who baptised him 'George Lander' after the governor, brought him over to London, and introduced him to Bishop Compton. For that cedulous prelate he translated the Church Catechism into the 'Formoso' language; and to him he dedicated his Historical and Geographical Description of Formosa (1704), which found many believers in spite of its patent absurdities, such as that Formosa belonged, not to China, but to Japan, and that the hearts of 18,000 boys were sacrificed every day by the Jesuits to the idols.

Psalmazar left England for watercolour dances to Oxford, and for a while he was lionised by the highest in the land. In spite, however, of his eating raw meat and enormous quantities of pepper and opium (an opium-eater he continued to the last), people gradually lost faith in him, or the novelty wore off, or by Law's Serious Call (1729) he was converted to a sense of the error of his ways. Anyhow, we find him the alleged importer of a white 'Formoso' enamel, a tutor, a regimental clerk (1710-17), a fan-painter, and lastly, for years a diligent hack-writer for the leading London newspapers, largely of his compiling; and his, too, one of the popular Essay on Miracles. But in all his strange life there is nothing stranger than the esteem expressed for him by Samuel Johnson. He was the man he 'sought after most,' 'the best man he ever knew,' and 'the best among the host of contrariating a bishop,' and whose 'piety, penitence, and virtue exceeded almost what we read of as wonderful in the lives of the saints.' An old man of fourscore years, he died in London on 3d May 1703.

See the autobiographical Memoirs of * * *, commonly known by the name of George Psalmazar (1764), and articles in Temple Bar (1865) and the Cornhill (1870).

Psalmody. See HYMN, SACRED MUSIC.

Psalms. The title indicates a collection of songs set to music (for use in the temple), and then sung in the churches. According to Flom, 'hymns;' this corresponds exactly to the Hebrew Chalilim, 'praises,' or 'songs of praise.' The etymological element is in fact the most essential in the name; but the solitary exception of Ps. lixxviii. there is an undercurrent of thanksgiving even in the most melancholy compositions (cf. Eph. v. 19, 20).

There was, however, an earlier stage of psalmody, as a linguistic study of the Hebrew title assures us, when the service of religious songs was of a character not under the control of guilds of singers. The ancient Arabs used a term (tahlih) which corresponds to 'chalih for the shouting of a short consecrated formula, and the common root of both names means 'to call, cry out.' Only by degree did the Israelitish 'psalmody' rise from a shouting like that of the vintage or the bridal night to the carefully trained singing of later times. Indeed, as late as the fall of Jerusalem the noise of the Babylonian soldiers in the temple is compared to that of the worshippers on one of the olden feast-days (Lam. iv. 13). The question therefore arises, Can our present psalms, so spiritual in tone and in form comparatively so artistic, really be the very forms of prayer and praise used by the pre-exilic Israelites? Or have they literally driven out earlier and less spiritual compositions? Or lastly, have the older formulae been greatly expanded and idealised, or even sometimes permitted to become imbedded in later works? For this last conjecture some analogies might perhaps be found in the prophetic literature (see, e.g., Isa. ii. 2-4, and Ewald, The Prophets, i. 83), but it can only be admitted to a heuristic proof of the existence in a psalm of really strong inconsistencies of thought and language. Till that proof is given let us accept each psalm as the monument of some particular age, without attempting to extenuate by analysis fragments of earlier origin than the rest of the poem. To ascertain approximately that age or those ages is the function of criticism. True; but have the critics the means of doing this? 'When once it is admitted, as it must be admitted, that the titles cannot be absolutely relied on,' says an English commentator, 'we are launched upon the sea of uncreative speculation. The critic gets no help.' The question of the origin of the Psalter is of course a complicated one, but we must not say that the student of complicated problems is like a mariner without a compass. There are three conditions upon compliance with which the disagreement of critics will be reduced within very narrow limits. The first is, that no critic should approach the Psalter until he has assimilated a good number of the best critical results which have been reached in other parts of the Old Testament. The second, that he should begin at the end of the Psalter—i.e. with Ps. cxlv.—and proceed backwards. The third, that he should break radically with the custom of looking at each psalm by itself, with a view to determining its period. The result is likely to be not only similarities in language and in tone between the Psalms and other old Hebrew writings; many at least of which afford valid evidence of the date of the poems, the psalmists being in a high degree initiatory, and infinitely more prone, for instance, to borrow from, or imitate, the prophets than to borrow from them. The reason of the second is that, the Psalter being a combination of five 'books' of psalms, it is natural to presume that the two last
PSALMS

469

(whi(ch properly form but one book) are later as collections from the three first. These five books are, (1) Ps. i.-xli., (2) Ps. xii.-lxxii., (3) Ps. lxxiii.-lxxxix., (4) Ps. xc.-cv., (5) Ps. civ.-cl. And that of the third is that within these live characteristic psalters, which have certain common characteristics, and may, at any rate at the outset of the inquiry, be presumed to contain works of the same (not too strictly defined) period. These minor psalters are the Davidic (to which the 'Davidic' psalms in Hallel, iv. and xlix., belong), the pre-exilic, the post-exilic, the pre-Exilic, the Asaphite, and the Songs of Ascent (i.e. of pilgrimage), commonly miscalled 'Songs of Degrees,' in addition to which there are various other groups of psalms, not marked by traditional headings, such as the Hallel and the Hallelujah psalms, the denter-Israelite (i.e. those which suggest the writer's acquaintance with the exile portions of Isaiah), and the Jeremianic (i.e. those which from internal evidence were written either by Jeremiah or by a follower of that great prophet).

Thus, the conscious or unconscious object of receiving Psalms has been the imparting a stricter and more scientific character to the argument from internal evidence. Not the least difficult part of the work is that which relates to the linguistic phenomena, the evidential value of which is variable, depending on the identification. This kind of evidence is no doubt rarely conclusive, but even in the case of the highly imitative psalm-literature will lead the critical student to some perhaps unforeseen results, unless indeed his way is barred by the arbitrary assumption that all the evidence of internal probability, which is not based upon these pre-exilic psalms have been introduced by editors. And what upon the whole are the results of a criticism which does not float 'upon a sea of uncertainty'? Two very definite ones may be mentioned, with a warning, however, to the student that the criticism of these portions was interwoven with that of other Old Testament books that many good Hebraists might hesitate to endorse even these moderately-stated results. First, that there is a considerable number of psalms belonging to the pre-Maccabean and Maccabean Greek portion of the post-exilic period (see especially Ps. lxxv.-cxv., cxvi.-cxvii., cxviii.). The possibility of this theory (which was virtually held by Theodore of Mopsuestia) is expressly admitted in the margin of our own 'Geneva Bible.' The objections to it are not entirely withstanding the critical study of them, however, are conclusive. It has been urged, for instance, that the so-called Psalms of Solomon (the composition of which falls between 63 B.C. and 46 B.C.) breathe an entirely different spirit from the psalms which may most plausibly be referred to the period of the Greek rule and of the Maccabean rising. But it can be easily shown that the latter event was a turning-point in Jewish religion, after which we might fairly expect a considerable difference in the tone even of liturgical poetry. Moreover, the phrase 'an entirely different spirit' is an exaggeration. There are certainly the germ of legalism in Psalms i., xix., 7-14, cxiv., and those of later doctrines of immortality and resurrection may (if the late dates of Ps. xv., xvii., cxvii., cxviii., be granted) be not unreasonable found in parts of the Psalms. It is not necessary to maintain that the Psalms of Solomon contain passages strikingly parallel to our Ps. xlvi. A second result is that none of the extant psalms are the genuine work of David, who was doubtless a gifted musician and poet (the early tradition on this point is clear), but whose hymns were probably too little in accordance with later ideas of art and of religion to escape the great literary as well as political catastrophe of the Exile. Contrast the life of David in the Books of Samuel with the character sketched, evidently from life, in the so-called Davidic psalms. Granting that David lived in the service of an ideal which he sought, but often failed, to realise, could that ideal have agreed with the picture presented to us in the Psalter? How much is there in the tone or the ideas of the implied circumstances of the psalms which agrees with the tone or ideas of the traditional speeches of David and with his traditional history? Enough perhaps to permit us to regard him as a for-advertisement of the nobler members of the 'community,' and the man of the post-exilic age, who was the 'root and offspring of David' (Rev. xxii. 16), but scarcely more than this. Indeed the only doubt is, not so much whether any psalms are Davidic, but whether any are even pre-exilic at all. The fact (which, even without scientific proof, it would be unreasonable to doubt) that David composed some psalms was enough to make collectors call certain psalms, or collections of psalms, by his name, somewhat as the various expansions of the older law in different ages were usually referred to Moses. David was in fact the most likely of the post-exilic psalmists to have been a poet, and the Psalms, written or composed in his name, were really the first to be written in that name.

Yet the arguments for this view are seldom, if ever, cogent, and mainly depend for their acceptance on our ideas of historical probability, which is never a certain ground of these pre-exilic psalms have been introduced by editors. And what upon the whole are the results of a criticism which does not float 'upon a sea of uncertainty'? Two very definite ones may be mentioned, with a warning, however, to the student that the criticism of these portions was interwoven with that of other Old Testament books that many good Hebraists might hesitate to endorse even these moderately-stated results. First, that there is a considerable number of psalms belonging to the pre-Maccabean and Maccabean Greek portion of the post-exilic period (see especially Ps. lxxv.-cxv., cxvi.-cxvii., cxviii.). It is not necessary to maintain that the Psalms of Solomon contain passages strikingly parallel to our Ps. xlvi. A second result is that none of the extant psalms are the genuine work of David, who was doubtless a gifted musician and poet (the early tradition on this point is clear), but whose hymns were probably too little in accordance with later ideas of art and of religion to escape the great literary as well as political catastrophe of the Exile. Contrast the life of David in the Books of Samuel
prophetic religion, and that the priests in particular were unprogressive. How then should there have been, if so like the other books, that spiritual regeneration of which the 'Second Isaiah' was presumably the chief instrument? The only way to avoid the conclusion that the Psalms are (with the possible exception of Ps. xviii., and some will add, of Ps. xx., xxi., xlv., lix., lxxii.) post-israelitic is to suppose that those books represent especially those which remind us of Jeremiah, were written in the reign of Josiah and during the Exile, with the prophetic hope that they would one day be required by a reorganised church-nation. This position represents perhaps the only lifted ecclesiastical optimism of the future, but cannot here be discussed.

In any case, the ideal character depicted in the Psalms belongs to an advanced period in Israel's history. It is that of a righteous man who, in the face of oppression, clings to his religion and his God, who trusts to be delivered, and for the most part is delivered, and who now and then forms bold anticipations of a world converted to the true God, or, it may be, is crushed into reluctant obedience; and in the noblest features of this ideal it is impossible not to trace the influence of the great religious poet of the later period—Jeremiah and the 'Second Isaiah.' It is such a righteous man who, at least in Books i.—iii., for the most part appears to be the speaker, and the question arises, whether he is more accurately viewed as a personification of Israel, or as simply the typical or representative Israelite, such as every member of the congregation either was or desired to become. In some cases no one can deny that the former theory is alone correct (see, e.g., Ps. iv., lx., lxxvii., cxvii., cxxxix.), and there are not a few other psalms where its absolute rejection would involve the interpreter in the greatest psychological difficulties (see, e.g., Ps. vi., xxii., xxx., li., lxx., cxxx.).

It has indeed been hastily stigmatised as forced and fanciful, but the number of passages elsewhere in the Old Testament which without it are unintelligible (see, besides the sections in Second Isaiah relative to the servant of Jehovah, Num. vii. 23—26; Micah, vii. 1—7; Hosea, iv. 4, 5, vii. 8, 9; Lam. i. 3), and the numerous analogies in the Greek choruses, prove the baselessness of the charge. The solidarity of the individual and his tribe was in the mind of the poet, and the relation of the individual to the ancient peoples. It is, however, a priori improbable that the new sense of the duties and privileges of the individual, which was stimulated (but hardly caused) by the preaching of Jeremiah and Ezekiel, should not have left its mark on the Psalter of the second temple. And do we not find such a mark on some or even many of the Psalms? Does not the personality of the psalmist sometimes at least assert itself with distinctness (see, e.g., Ps. xiv. 1, lxvii. 2, 3, 13—17, 21—28, evi. 4, 5, cxxxix. 18)? Yes; but it will also be noticed that even in such passages and where no mark of distinction is to be observed (perhaps the only exceptions) the psalmist speaks, not only in his own behalf, but at any rate for a class within the church-nation. And in some of the psalms in which a reference to the nation may most plausibly be maintained, it is almost everywhere impossible to hold that the typical or representative Israelite (in the sense described above), or even that the psalmist himself in the same psalm sometimes has the nation, sometimes himself, or any other pious Israelite, in view as the speaker. Reading the Psalms from this point of view we see that spiritual regeneration of which we see that it is the troubles of the Church-nation, and not those of any individual, however highly placed, which are described, we can account for the strength of the language, and are also stirred up to purge the personal criticism of its selfishness. It only needs to be added that every part of the church-nation must be a truly historical one.

We must not rest contented with the perception that there is a strong family likeness in the Psalms. We must seek out not only resemblances but differences to ascertain, so far as we can, the historical background of each group of psalms. Hitzig and Ewald may have gone too far in this historical 'divination,' but without exercising this faculty to some extent it is impossible fully to enjoy the Psalms. Historical data will not be wanting if we search for them, and the comparative method will here too be found applicable. The period from the Return to the Maccabees was not so monotonous as it is represented in our handbooks, and by judiciously distributing the Psalms over it on grounds of internal evidence we gain as many fresh first-class authorities for the history of the Jewish Church.

periods in history when the acknowledgment of the authorship of certain pamphlets or books might mean death or banishment to the writer. It is commonly found throughout the ages that, on public men, or those consisting of theological controversy, the attacks would appear under assumed names. In recent times young authors especially have frequently risked a new work under a pseudonym, and have kept it up afterwards. Once an author is famous it is found advisable to stick to a pen-name. For instance, every one knew the writings of 'George Eliot,' but few would at once have recognised a work by Mary Ann Evans. The present list is not intended to be exhaustive: names in occasional use are not given, but only those which have been impressed by many of the public. Neither have those well-known literary disguises as those adopted by the author of Waverley been repeated here. It may just be noted that for a longer or shorter number of years 'the author of Waverley,' 'the author of John Halifax, Gentleman' (Mrs Craik), 'the author of Guy Livingstone' (G. A. Lawrence), 'the author of Oliver Twist' (W. Robertson), 'the author of Chronicles of the Schönberg-Cotta Family' (Mrs Charles), 'the author of Supernatural Religion' (unknown), 'the author of Ecce Homo,' 'The Autocrit of the Breakfast Table,' &c. have been practically used as pen-names.

PSORALEA lead It large monasteries. A brief cathedrals, the youth, persons is (1891) 1,029,053. Venus) the beautiful population. But she now often the feeling, science neural distribution (1885) of these men. the body. The feeling, constitutional. is covered by a small, whitish scale. may be covered with a whitish scale. The feeling, constitutional. The disease may occur at any age, but usually first manifests itself in youth, rarely before the age of six. It is extremely apt to recur: it is rare for a person to suffer from it only once. The causes assigned for the disease; it has been attributed to scrofula, gout, and many other constitutional states; and doubtless it may be associated with them. But, with the exception of heredity, no cause has been satisfactorily shown to lead to its development. It frequently occurs in persons otherwise in perfect health, and, except in very severe cases, does not interfere in any way with their employments. If left to itself, the disease generally tends to persist indefinitely. But in the great majority of cases it is very amenable to treatment, both local and constitutional. Locally, ointments, tar, resorcin, pyrogallic acid, &c. are most in use; internally, arsenic is far the most valuable remedy. Where it has failed, iodide of potassium in large doses, liquor potassae, and carbolic acid have sometimes succeeded. But some cases resist the most varied and persevering efforts for their cure; and nothing has yet been discovered which will prevent the tendency to recurrence of the disease.

Psyche (Gr., 'the soul'), an exquisite creation of the later mythology of Greece. She was the youngest of the three daughters of a king, and so beautiful that mortals mistook her for Aphrodite (Venus) herself, and did all kinds of favors for her. This excited the jealousy of the goddess, who sent Eros (Cupid) to inspire Psyche with a passion for the most contemptible of all men; but Eros was himself wounded as deeply by her glances as ever he had wounded others with his darts. He accordingly caused her to be carried to a beautiful palace of pleasure, and here every night he visited her, unseen and unknown, and left her before morning broke. Thus Psyche might have enjoyed perpetual delight had she remembered the advice of her unknown lover, who warned her not to seek to know who he was. But her passions led her to tear down the strongholds of her own defense; she had allowed to visit her, played upon her curiosity, and persuaded her that she was embracing a monster in the darkness of night. Lighting a lamp when Eros was asleep, she saw with rapture that she was the mistress of the most handsome of the gods, but in her excitement she let a drop of hot oil fall on the sleeper's shoulder. This awoke Eros, who upbraided her for her mistrust, and vanished. Psyche gave way to the most passionate grief; she tried in vain to throw herself into a river, then wandered about from temple to temple, inquiring for Eros and the way to that palace. But, as she entered, she met the goddess, where she was seized by the goddess, and kept as a slave. Eros, however, who still loved her, invisibly helped and comforted the hapless maiden, reconciled her to his mother, and was finally united to her in immortal wedlock. In works of art Psyche is represented as a beautiful maiden with the wings of a butterfly. Her story was considered as an allegory of the progress of the human soul through earthly passion and unhappiness to that of pure celestial felicity; but it must not be forgotten that it is merely a version of one of the more advanced folk-tales. See Cupid, and Zingows's Psyche and Eros (1881).

Psychic Forces. See THEOSOPHY; and for the Psychical Research Society, see APPARITIONS.

Psychology may be briefly defined as the science of mental phenomena. After having long occupied a doubtful place as a department of metaphysics, supplemented by many empirical observations, its character as a science dealing with a special order of facts, and many of the laws of occurrence of these facts, may now be said to be established. At the same time opinion is still far from unanimous on many of the most important points of psychological doctrine, especially on such points as involve a philosophical view of the nature of mind. The chief different ways of conceiving and defining the mental facts with which psychology has to do may be traced to the influence of rival philosophical hypotheses as to the nature of mind. Thus, in the first place, we have the view that psychology deals with the facts of the conscious mind which, when knowing, feeling, or striving, is always conscious of itself as knowing, feeling, or striving—i.e. is self-conscious. This is the view, for instance, of Sir W. Hamilton. But it has many difficulties. We can hardly ascribe self-consciousness to the lower animals or to very young children, insane persons, whom again life closely belongs to them; so that it would seem that mental life and self-consciousness cannot be identified. Further, many psychologists (including Hamilton) are of opinion that there are mental phenomena unaccompanied by self-consciousness even in mature human life. And if self-consciousness is thus recognised as belonging to mental life only under certain conditions and at a comparatively developed stage, it will be one of the main purposes of psychology to examine these conditions and trace its growth. In the second place, a materialistic view of mind puts it altogether, in one way or another, brain-physiology play the part of a psychology. It is plain, however, that a sensation or a feeling of pleasure or pain is a fact of an entirely different order from a neural disturbance. The one may accompany or even cause the other (or both may
be only different aspects of the same ultimate existence), but the characteristic nature of the mental fact is not reached by the most thorough investigation of its physiological conditions, while the phenomena they are adduced to explain. In the third place, an attempt has been made (sometimes apart from any philosophical hypothesis as to the nature of mind) to start with certain mental facts—called presentations, sensations, or feelings—of which the ultimate can often be traced, and to extend the laws and manner of their combination and succession. This method has been worked with excellent result by the English Associationist psychologists. By a similar method, and by treating presentations as forces, Herbart and his followers have elaborated a mechanical view of the mind and reduced psychology to mathematical form. The difficulty of this mode of conceiving mind is to explain how a series of sensations—or any interaction of presentations—can generate the consciousness of a self persisting through changing states; and even to give any meaning to sensation or presentation without regarding it as experienced by or presented to mind. On these grounds many psychologists, while influenced by the scientific method of the Associationists and of Herbart, hold that the interpretation of experience is as belonging to a subject or mind. So far, mind must be assumed by the psychologist as implied in the experience of which he has to trace the development. This subject, or mind as the condition of experience, may be admitted to elude psychological observation. As a whole says a psychologist, one can catch myself at any time without a perception, and never observe anything but the perception ̣ — i.e. it is the empirical ego, or mind with its content of experience, which is the object of psychological observation, and not the pure ego, or subject, which is nevertheless implied by every mental fact. Psychology may, in this way, be distinguished from other sciences as dealing with subjective facts, or, rather, with the subjective aspect which belongs to all facts—i.e., as Dr. J. Ward puts it, the phenomena connected with presentation to a subject.

Method of Psychology.—If this view of the subject-matter of psychology be adopted, it is clear that the ultimate source of our knowledge of mental facts must be the knowledge each person has of his own mental states. The mental attitude of attending to these states is called Introspection. The nature and value of introspection have been much disputed. But the arguments of Comte and others to show that the process is impossible, and psychology only another name for a department of physiology, prove too much: for were introspection impossible we should not even know that there are such things as mental states. It may be admitted, however, that the introspective attitude involves an effort of will, and mental states are not always willing to be observed. Consequently many obscure elements of mental life may elude its cognizance, and only become known through their effects upon the flow of ideas; while, on the other hand, states of intense mental concentration exclude it, and can only be observed by the weakened form of memory-images. It is even held by many writers that this is the sole method of introspective observation: that all introspection is retrosection. In this way the results of introspection are apt to lack accuracy, and (as it is sometimes written) their also lack objective or universal validity. To supply these wants the introspective or subjective method has been supplemented by objective observation both of the physiological antecedents and concomitants of mental facts, and of the expressions, products, and records of conscious life. The latter are to be found in the emotional expressions and actions of normal men; in the emotional expressions and actions of children; in the innate or race type, the insane, and the lower animals; in language, art, and all institutions. To this side of psychological study, which involves the application of the comparative method to psychology, contributions of the greatest value have been made in the Zeitschrift für Volkerpsychologie, or comparative psychology, by G. F. Müller, L. C. H. Steinthal, and others.

Further, within recent years attempts have been made to apply experimental methods to psychology. Experiments on reaction-time, for instance—i.e. on the time taken to react upon stimuli—lead to the determination of the time taken up by mental operations of different kinds and different degrees of complexity. Similar experimental methods have been adopted for investigating the accuracy of reproduction, the number of things that can be attended to at a time, &c. Laboratories, such as that at Leipzig, of which Wundt is the head, exist both in Germany and in America for the prosecution of these experimental investigations. The results of many experiments have already been recorded; but it would be premature at present to estimate the value of these results for psychology. Amongst the experimenters who keep the history of their investigations always in view, mention should be made of Miinsterberg (Beiträge zur experimentellen Psychologie, 1889 and following years).

Psychophysics.—The experimental inquiries above referred to may to a large extent be traced to certain investigations (chiefly) of E. H. Weber's on minima sensitiva and on the relation between the intensity of the sense-stimulus (which can be measured objectively) and the intensity of the consequent sensation (which cannot be directly measured). His experiments were further carried out and their results formulated and elaborated into the science of psychophysics by G. T. Fechner (Elemente der Psychophysik, 1860; reprinted 1889).

By psychophysics Fechner means the exact science of the relations between body and mind, this science being based upon facts and numerical relations they involve. The generalisation arrived at from experiment is by Fechner called Weber's Law, and expressed by him in the following (amongst other) terms: There will be the same relative increase in the intensities of sensations, provided the relative intensities of the stimuli producing them remains the same. Thus, an increase of 1 to a stimulus whose strength is expressed by 100 will be experienced as of the same intensity as an increase of 2 to a stimulus whose strength is 200, or of 3 to a stimulus whose strength is 300, &c. The literature of psychophysics is occupied with the experimental verification, the mathematical development, and the interpretation of this law. But neither its experimental nor its interpretative application is quite satisfactory. Experiment supports it in a certain range of sensibility. It is limited first of all by what Fechner calls the fact of the threshold—i.e. the fact that a certain amount of stimulus is required to produce any sensible effect whatever; and secondly, at the other end of the scale, when the stimulus is beyond a certain intensity, the relation ceases to hold good, while within these two limits its verification cannot be said to be exact. Further, it is only in the sense of pressure and the muscular sense that we can accurately measure the intensity of the stimulus in the form in which it reaches the nervous end-organs; in hearing and sight the objective stimuli undergo physical or chemical changes in the sense-organ before reaching the extremities of the nerve-
fibres. Again, all the experimental methods for establishing the law assume the equality of least sensible differences. Thus, if there be stimuli measured respectively by 100, 101, 200, 202, causing sensations $x$, $x'$, $y$, $y'$, such that $x'$ is only just distinguishable from $x$ but only just distinguishable from $y'$, it is assumed that $y' - y$, an assumption which neglects the important fact that there is no mental content corresponding either to $(x' - x)$ or to $(y' - y)$. Finally, even if the law can be held to be established, it is not clear that it requires to be interpreted (by Helmholtz) as properly psycho-physical. It may also be held that the law is really physiological, the intensity of the stimulus being modified in this way by irradiation in the nerve-centres; while Wundt has attempted a psychological interpretation of it, maintaining that it holds of the relation between mere sensation and the 'apperception' of the sensation by the direction of attention to it.

Mental 'Faculties'.—The observation and description of mental facts have led to a classification of them, according to their degrees of likeness, in certain respects. These laws lead to a series of different powers or functions of the mind. In the earliest stage of psychological inquiry we even have them described as different parts of the soul. In this way Plato distinguishes desire, anger, and reason, and locates them in the lower part of the body, in the heart, and in the brain respectively. But the classification which had most influence upon subsequent writers was Aristotle's. His distinction of thought and desire is the origin of the dual classification of intellectual and active powers (each with many subdivisions) which was for long put into each branch of psychology. A tripartite classification—Cognition, Feeling, and Desire or Will—was put forward by the psychologists of Kant's time, accepted by Kant, and since his time (in Great Britain since Hamilton's time) has been very generally adopted. The value of such classifications is easily, and has often been, overestimated. In the first place, it is clear that, although such functions or faculties may be distinguished, they do not operate apart from one another. No concrete state of mind consists merely of knowledge or merely of will; nor can it be properly described by the names, except as means of describing it by its most prominent characteristic. In the second place, it has to be borne in mind that it is no explanation of a mental fact to refer it to a mental faculty. To maintain, as Kant, Hamilton, and Lotze did, that there are certain fundamental conscious functions or conscious elements which cannot be reduced to some single function or element, gives no real support to the view which seems to underlie much of the 'faculty-psychology'—the view that mind is a congeries of distinct faculties, and psychology a process of their separate analysis, except as a means of describing it by its most prominent characteristic. In the second place, it has to be borne in mind that it is no explanation of a mental fact to refer it to a mental faculty. To maintain, as Kant, Hamilton, and Lotze did, that there are certain fundamental conscious functions or conscious elements which cannot be reduced to some single function or element, gives no real support to the view which seems to underlie much of the 'faculty-psychology'—the view that mind is a congeries of distinct faculties, and psychology a process of their separate analysis. To refer phenomena to memory, generalisation, &c. as their causes is to mistake a name for an explanation. The 'Faculty-psychology' described and demolished by the English Associationists and by Herbart is, however, rather a mode of thought into which certain writers have frequently lapsed than a method which they have consciously adopted and defended. And the quest for a simple and uniform mental element from which all that wealth of conscious life has been derived is not therefore successful, because the faculty psychology is only a confused conglomeration of the interaction of presentations as accounting for all mental phenomena; in a similar way W. Spencer seeks to derive mind from a succession of somethings which can only be described as analogous to nervous shocks. But the difficulty of both is to pass from this objective element to the feeling of pleasure or pain, aptly described by Hamilton as subjectively subjective, or to the phenomena of Volition. Accordingly, many psychologists who are at one with Herbart and the Associationists in rejecting the conception of faculties as a mode of explanation, and in whose final analysis we can reach of consciousness of or of mental phenomena does not enable us to derive subjective feeling (of pleasure or pain) from presentation, or activity from either, the three elements being involved in the simplest state of consciousness (the term 'consciousness' as distinguished from 'self-consciousness', being here used as a quite general term for any mental state).

Attention.—Many of the most important controversies of psychology centre in the question of the nature and extent of the activity involved in consciousness. In its simplest form this activity is seen in the subjective reaction involved in apprehending a presentation; in its most developed form it is the act of will which determines a course of conduct upon which momentous issues are known to hang. In the latter case, as well as in the former, attention is a factor of primary importance. Attention. Now attention is generally allowed to be a special 'faculty,' or separate activity different from the elements of consciousness already described. It is simply consciousness regarded as active and as concentrated on some portion of its object. Hence the subjective consciousness of intensity of that portion is increased. The problem is chiefly whether this active concentration is ultimately determined by the strength of external factors. It is clear that the direction of attention is conditioned by the previous mental groupings of ideas; the 'concentration of attention' is focal, localized, and even claretegical; one of the muscular adjustment—of any kind directed to objects of sense, and also (although in a less marked degree) when directed to a train of thought. These facts are differently interpreted. On the one hand, Bain, Ribot, and others find the basis of attention in the muscular adjustment; on the other hand, the muscular adjustment is looked upon as the organic expression and development of subjective activity; and this subjective activity is held to be involved in the simplest state of consciousness. The one view looks upon the external environment as determining both attention and the internal. According to the other view the process is one in which a subjective or spiritual factor expresses itself through and gradually extends its control over an organic and physical environment.

Sensation.—Sensations are commonly defined as the simple mental states which result from nervous stimuli. This physiological reference enables us to distinguish the Special Senses, with their clearly defined organs adapted to the reception of different kinds of external stimuli, from Organic or General Sensibility, which arises from the state of the internal organs of the body (such as the alimentary canal, the lungs, and the heart), and from the Motor Sensations. These last (which play so important a part in the development of knowledge) are due to the central excitation of a motor or efferent nerve, and the consequent contraction of the muscles in which it terminates (the Nervous System). The sensation both modifies and is modified by the conscious state into which it enters. We have no experience, and can form no valid conception, of the mere sensation. For the subject which experiences it, it is in their entirety. In Helmholtz it is the whole thing which is experienced. This is a point which has been commonly overlooked by the Associationist psychologists. They started with a succession of disconnected mental molecules, called sensations, and attempted to trace the growth of mental life from their combination. But this is to begin with an abstraction.
The earliest stage of mental life would rather seem to be a vague manifold into which distinction is just being brought; and the growth of knowledge consists not only in the addition of new elements, but in drawing new lines of distinction and forming new groupings of elements. And these distinctions and groupings may involve, first, the modification by the varying intensities of different elements in the changing mental content, or by the continuous redistribution of attention.

Ideaion.—The mental content thus varies in the distinctness of its parts, which may even disappear from consciousness and afterwards reappear. This reinstatement in consciousness is called Representation or Ideation, and the represented or ideal contents are called Images. The circumstances determining the succession of ideas and formation of images are, first, new sense-impressions; secondly, voluntary or directed attention; and thirdly, the mutual influence of the mental elements. It is the last of these which is referred to under the title of Laws of Association. In the article Association of Ideas an account is given of the circumstances in which experience recalls another. In every case of association a twofold process would seem to be involved. A portion of the present mental content coalesces with a resembling portion of a past mental state, and the revival of this portion involves the re-inscription of the mental elements by which it was previously connected. The latter, which is the properly reproductive process, is thus due to the fact that consciousness is not a collection of atomic sensations, but a continuous whole.

Perception is the knowledge by means of sensation of an individual object or thing. The nucleus of the percept is thus one or more present sensations which coalesce with revived or ideal elements belonging to the same sense, and combine with revived or ideal elements belonging to other senses. These sensations and representations may be bound together and presented as a single mental content, which we refer to a portion of the body or to a thing in space beyond the body, and to which we ascribe qualities corresponding to our sensations and representations. The percept is thus determined by the combination of our sensations or representations, and in the case of a given percept, involves, first, complexity of elements; secondly, localisation; and thirdly, individualisation and objectification. The complexity consists of the elements of present sensation, and of the ideal group with which the former coalesces or combines. The localisation clearly involves the perception of space. The individualisation and objectification may be accounted for by the following considerations: (a) The various sensations grouped together in a percept—e.g. the resistance, touch, colour, taste, smell of an orange—are so related that modification of one of them commonly involves modification of the others. Thus they come to be perceived as a group. (b) Not only are motor sensations involved in fixing attention on other sensations, but the greatest distinctness of the other sensations is commonly accompanied by conditions which admit also of sensations of touch and resistance. Hence the object comes to be experienced as offering resistance or as an obstacle. (c) In this way the other sensations come to suggest touch and resistance, and thus to be referred to a thing in space. This constitutes the mental character of the percept. This process involves giving space a certain distinctness apart from the former theory. But it is important to remember that certain sensations—odors, tastes, and even sounds—are localised only indirectly, as belonging to a visible or tangible object. And this fact at once suggests the lines upon which an empirical analysis of space should be carried out.

Thus we start with two opposed views of the perception of space: first, the Intuitive or Nativist theory, according to which space is an innate idea (or, as since Kant it has more commonly been put, the form in which we perceive objects), and is not derived, as it is held by the empiricists, from receiving, belonging a priori to the mind, and contributed by it in the production of experience; secondly, the Empirical theory, according to which space is the worked-up product of sensations. The universal and necessary character of the spatial perception has been brought forward in defence of the former theory. But it is important to remember that certain sensations—odors, tastes, and even sounds—are localised only indirectly, as belonging to a visible or tangible object. And this fact at once suggests the lines upon which an empirical analysis of space should be carried out. By Herbart space has been derived from a series of sensations which can be repeated in the same and in reverse order. By Bain it has been held that it is due to muscular sensation—movement giving the perception of empty space; resistance giving that of space filled or body. Sensations both of movement and resistance accompany touch; and sensations of movement accompany sight to an extent which is not nearly equalled in the other senses. In addition to this, however, we must take account of tactile or immediate touch, the 'local signs' which belong to tactile and visual sensations. These local signs are due to the extended nature of the sense-organs of sight and touch, and are elements in sensation by which sensations arising from the sense-organs of other sensibilities to the victim (or of the skin) are distinguished from one another. The simultaneous distinctness in sensation which is due to these 'local signs' is gradually
interpreted by motor sensations, and out of these elements there gradually emerges the perception of one's own body, by relation to which other things are localised in space. Thus, although the perception of space is implied in that of body, the two perceptions grow to clearness together. Even within this empirical analysis, however, it may still be held—as Lotze held—that there is an a priori mental tendency to form the perception of space.

The opposed views of Nativism and Empiricism are applied to the perception of time as well as to that of space. And the perception of time only seems a simpler question than that of space because we are apt to confound the succession of presentations on which it is based with a presentation of succession, which, of course, would be a presentation of time. The elements from which this presentation of time is derived may be somewhat as follows: When a number of presentations are successively presented, each grows fainter as attention passes from it, and hence arises a vague distinction between present and not-present. Afterwards, on the same series being repeated, the second member will raise in intensity when the first is presented, and therefore will fully participate in the experience of the present when the second is presented, the first will be sinking in intensity, while attention will be passing on towards the third, whose intensity will therefore be rising; and so on throughout the series. Hence the vague distinction of present and not-present becomes more definite as a distinction of past, present, and future, and this is the presentation of time.

Memory and Expectation.—Both of these are distinguished from the mere succession of ideas and images by involving a reference to one's own conscious life as a suitable topic. When an image is remembered its various parts have a fixed order and position, it is accompanied by a number of attendant or accessory ideas, and it is recognised as belonging to one's past self. The expected image has not always the same fixed position or number of attendant ideas; but it, too, is referred to self—one's future self, and it is characterised by an element of striving or tension and by an increasing degree of intensity. The phenomena of memory and expectation are a recognised difficulty for the theory which seeks to derive mind from the succession of presentations.

Thought.—In the process of thinking different mental contents are related together—generalised into notions or concepts, discriminated, and, in the higher forms of thought, arranged in an orderly manner under some scientific or other ideal. Thinking is further distinguished from perception and imagination by dealing with classes of things rather than particular objects, and by being mainly voluntary, whereas perception is mainly automatic. But the distinction is not an absolute one. In imagination, and even in perception a process of voluntary selection may be involved in perception; and a clear perception involves a conception of a class to which the object is referred. Further, the relating process which is characteristic of thinking may be found, though in a less explicit manner, involved in perception: for a concept has been shown to consist of a variety of simple ideas connected together in definite ways. Carrying the analysis further, we can find no conscious content without such relations. This has been commonly brought out by emphasising the necessity of difference for concept formation. Holberg has asserted that "to have always the same sensation and to have no sensation at all come to the same thing; and this has been formulated by Bain into the Law of Relativity, that all consciousness is consciousness of difference: not, indeed (as Bain some-

times puts it), that we are conscious only of difference, but that all consciousness involves difference or discrimination; as it may also be shown to involve likeness or assimilation and synthesis.

Relations are thus involved in all consciousness equally with elements related. 'Feelings' and 'relations between feelings' (to use Mr Spencer's terminology) must be regarded as practically ultimate units of mind in mind. The English Associationists made consciousness begin with separate units of sensation or 'feeling'; and those writers who have received and carry on the tradition of the Associationists have devoted much attention to determining the nature of the connexion between the various atoms of datum of consciousness is not separate atoms of presentation, but what Dr Ward calls a presentation-continuum, and if the growth of mind consists not merely in additions to that continuum, but in drawing new lines of distinction and connection within it, we may see how neither the so-called 'feeling' nor the so-called 'relation between feelings' is independent and conceivable by itself, and how both are simply abstractions from the state of mind which—even at its simplest—is a concrete phenomenon. In other words, what is characteristic of consciousness is that the characteristic of sensation is involved in all consciousness.

Feeling and the Emotions.—The term Feeling is of very ambiguous significance in psychology. But there is a pretty general agreement to use it for the second of the three elements in the tripartite division of mind (although, unfortunately, it has not been restricted to that use). The psychology of feeling has two chief problems to deal with: first, to determine the nature and conditions of pleasure and pain, as contrasted with other elements of mental life; and secondly, to analyse into their elementary units. The complex nervous sensations of other elements of consciousness and of motion—e.g., tension, will, etc.—are admitted to be composite. Feeling is connected, more or less distinctly, with a presented or ideal object, and is complicated with elements of organic sensation, and, usually, with tendencies to action or elements of desire. These complex states of feeling, or emotions, take very various forms, according to the elements of which they are composed, and their mode of origin. The classification of the emotions and the nature and origin of such complex elements as sympathy, sentiment are still vexed questions of psychology.

Desire and Volition.—In these phenomena we have the development of the active element in mind complicated with feeling and manifesting itself in muscular activity. Writers who regard this active element as ultimately due to the play of merely presented or external factors have attempted to derive volition from spontaneous movement (Bain) or from reflex action (H. Spencer)—factors which enter consciousness merely as motor presentations. As opposed to this we have the view that feeling and desire (WILK) and the direction of attention to certain ideal elements or groups. Whether this direction of attention is itself determined solely by pleasure and pain is a question which has raised more controversy than perhaps any other question in psychology (see WILL). In Desire things are connected toward the external or ideal end, accompanied by feeling and by an element of striving. Normally, when the conception of the end has been associated with definite means to its realisation, the desire is followed by a volition or act of will. The development of volition is a matter of growth, and of volition, consciousness. Beginning with the act of attention, the power of will is gradually extended over the bodily movements controlled by muscles in connection with the motor nerves. Movements which are at
first random, reflex, instinctive, or merely expres- 
sional, are brought within its operation. Further, 
will grows side by side with reason and imagination, 
is not bounded not by reason or imagination 
only, but in response to images and concepts, and 
can thus be regulated by reason. A double tend-
cy is at work in this development: the associative 
and automatic tendency of acts frequently repeated 
to become habitual; and the intellectual tendency 
by which ends and the aims tending towards them 
are brought into rational order. In this way the 
individual comes to act for permanent ends and 
from fixed principles, and to develop a definite 
character.

LITERATURE.—The first scientific treatise on psychology was 
Aristotle's work De Anima. In modern philosophy 
the intuitional and spiritualist theory of psychology is to 
be found in Descartes and Leibnitz, an empirical and 
materialistic theory in Hobbes. The Association-psycho-
logy, which traces descent from the psychological philo-
sophies of Locke and Hume, and from the physiological 
psychology of Hartley (Observations on Man, 1749), may 
be read now in the works of James Mill (Analysis of the 
Phenomena of the Human Mind, 2d ed. 1809), J. S. Mill 
(Examination of Hamilton's Philosophy, 5th ed. 1878), 
and A. Bain The Senses and the Intellect, 3d ed. 1868; The 
Emotions and the Will, 3d ed. 1860; Mental 
and Moral Science, 3d ed. 1877. Belonging to the 
same school, but conditioned throughout by the doctrine 
of evolution, is H. Spencer's Principles of Psychology 
(2d ed. 1870-72). To the Herbartian influence is due the 
exhaustive work of W. Voitke and V. Spitzler (Lehrbuch der Psychologie, 3d ed. 1884). Independent views, 
which are yet influenced by Herbert, are worked out by 
Lotze (Mediçinische Psychologie, 1862; book ill. 
Metaphysics, Eng. trans. 1884; Microcosmica, Eng. 
trans. 1883; Outlines of Psychology, Eng. trans. 1886) 
and by J. Ward (article Psychology in Encyc. Brit., 9th ed.). Experimental psychology is represented by the 
work, among others, of Wundt, Ebbinghaus, Münster-
berg, Kibot, Pierre Janet, and by many contributions 
from German, French, Italian, English, and American journals. 
A useful summary of results is given by G. T. Ladd 
Elements of Physiological Psychology (1887). Founded 
largely upon these is the brilliant work of W. James, 
Principles of Psychology (1890). Important text-books 
are Sully's Outlines of Psychology (1884) and The Human 
Mind (1882). Baldwin's Handbook of Psychology: Senses 
and Intellcit (2d ed. 1890) and his Elements (1883), 
Dewey's Psychology (1889). J. C. Murray's Handbook of 
Psychology (1885). Hoffding's Outlines of Psychology (Eng.
trans. 1881), and Maheu's Psychology (R. Catheline, 1889). 
Wundt's Lectures on Animal and Human Psychology 
were translated in 1894: C. Lloyd Morgan has published 
An Introduction to Comparative Psychology (1894) and 
Psychology for Teachers (1883); and G. T. Ladd 
Primer of Psychology (1894). See also PHILOSOPHY, 
and other articles cited there.

Psychrometer, an instrument for measuring the 
tension of aqueous vapour in the atmosphere: 
a wet and dry bulb Hygrometer (q.v.).

Pterodactyl (Gr., "wing-finger"), a remarkable 
winged reptile, the remains of which are met 
always white, but have dark shafts to their quills. 
In summer the males are predominantly grayish 
brown above, with blackish head, shoulders, 
and breast, with white belly, with black tail-feathers 
tipped with white. In the females a tawny colour 

Common Ptarmigan (Lagopus mutus), summer and 
winter plumage.

Pterichthys, See BOGHAZ-KEUL.

Pterichthys (Gr., "wing-fish"), a genus of 
eptic Ganoid fishes, remains of which occur in 
Devonian strata. The head and body were covered 
with bony sculptured plates, and the pectoral fins 
to the wing-like appearance of which the name 
refers were large and prominent.

Pterolites, or Pterolcetes. See SAND-GROUSE.

Pterodactyl (Gr., "wing-finger"), a remarkable 
winged reptile, the remains of which are met
PTERODACTYL

with in the Jurassic and Cretaceous systems. There are numerous forms of Pterodactyl which are included in the extinct order Ornithosaurus. The head was relatively large and snout-like, the long jaws being furnished with simple and pointed teeth, implanted in separate sockets. The eye-orbit was very large, the sclerotic having generally a ring of bony plates, and the nostrils approximated to the orbits. The neck was long and bird-like, consisting of procumbent vertebrae which were longer than the dorsals—the latter varying from seventeen to twenty in number. From three to six vertebrae are anchylized to form the sacrum. The tail is generally short, but long-tailed forms are also met with. The scapular arch and keeled sternum in their general characters resemble those of the carinate birds. There are four digits on each limb—the outer digit of the manus (corresponding to the fifth of the typical series) being immensely elongated for the support of a membranous expansion (patagium), which was also attached to the sides of the body to embrace the hind limbs and tail. The other digits of fore and hind limbs terminated in curved claws. Most of the bones are hollow like those of birds. The body was probably naked.

Many forms of Pterodactyl are known, in some of which the skull is less bird-like than that shown in the accompanying illustration. In Rhamphorhynus the extremities of the jaws are usually edentulous, and were perhaps sheathed in horn; the base of the jaws, however, was furnished with teeth which were inclined forwards. In the same form the tail was long, and provided at the extremity with a leaf-like steering membrane. In Dimorphodon the jaws are provided with strong teeth in front and much shorter ones behind; and the tail was long.

Some pterodactyls were small—Pteniodraco being not larger than a sparrow. Others were about the size of a woodcock. Yet others, however, were much larger—some having a spread of wing of 5 or 6 feet, and even of 25 feet in the case of certain forms from the Cretaceous rocks of England. The form of its extremities shows that the Pterodactyl was capable of perching on trees, of hanging against perpendicular surfaces, and of standing firmly on the ground, when, with its wings folded, it might crawl on all fours, or hop about like a bird.

Ornithosaurus are well represented in the Mesozoic strata of Europe and North America. One of the richest repositories of their remains is the famous lithographic stone of Solenhofen, in which the fossils usually occur in a fine state of preservation—even the impression of the membranous wing being sometimes clearly seen. See Nicholson and Lydekker's Palaeontology.

Pteromys. See FLYING ANIMALS.

Pteropoda (Gr., 'wing-footed'), a class or sub-class of molluscs, having two lobes of the 'foot' developed into wing-like swimming organs. They live in the open sea, and are carnivorous. Distributed in all seas, they often occur in limnicous swamps, and afford food to fishes and Cetacea. The body is bilaterally symmetrical, but this is doubtless secondarily acquired. In some (Thecosomata) the viscera are covered with a delicate shell; the others (Gymnosomata) are naked, but all the former have larval shells. The latter, grizzle-like shells are abundant in the Ooze (q.v.) of some regions. It is very likely that the Pteropods should be ranked not as a separate class of molluscs, but as a sub-class of Gasteropods. Of the Thecosomata the general investigators are C. Arai and C. Conmore, as Clio and Pseudomeron are of Gymnosomata. Fossil Pteropods appear even in the Cambrian strata. See Pelseneer, Challenger Report (1889). Some Pteropods are sometimes called 'sea-butterflies.'

Ptolemaic System. See PTOLEMY.

Ptolemais. See ACRE (ST JEAN D').

PTOLEMY, name of the Macedonian kings of Egypt. The first, a son of Lagos, was called Soter ('Saviour') by the Rhodians, whom he defended against Demetrius Poliorcetes. He became one of the greatest of the generals of Alexander the Great (q.v.), and on Alexander's death became ruler of Egypt.

For the other Ptolemies, his successors, see EGYPT, Vol. IV, p. 241; and for their patronage of literature, ALEXANDIAN SCHOOL.

PTOLEMY, properly CLAUDIUS PTOLEMAEUS, a celebrated astronomer and geographer, was a native of Egypt, though it is uncertain whether he was born at Pelusium or Ptolemais in the Thebaid. Nothing is known of his personal history, except that he died in Alexandria in 130 A.D., and there is probable evidence of his having been alive in 161. The chief of his writings are the Mégalya Êkòma ñy Òstronhia, which, to distinguish it from the next mentioned, seems to have been denominated by the Greeks and by the Arabs after them megistè, 'the greatest,' whence was derived the name Almagest (with Arab article al, 'the'), by which it is generally known; the Tetrabiblos Syntaxis, with which is combined another work called Karpous or Centipodapros, from its containing a hundred aphorisms—both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; a treatise on the phenomena of the fixed stars, or a species of almanac; and the Geography, his great geographical work, in eight books. The rest of his works are of inferior importance, and consist of descriptions of various kinds of Projections (q.v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the Almagest.

Ptolemy, both as an astronomer and geographer, held supreme sway over the minds of almost all the scientific men from his own time down till the 16th-17th century; but, and in astronomy specially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy he depended almost entirely on the teachings of Hipparchus. But, as his works form the only remaining;
authority on ancient astronomy, the system they expound is called the Ptolemaic System, after the author.

As a geographer Ptolemy is the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from Ptolemy's works, we know nothing. Ptolemy's improvements and suggestions are at once both valuable and correct; but it is sometimes difficult to separate his data from those of Marinus. His geography is divided into eight books, all of which, with the exception of the first, eighth, and tenth, are usually treated as separate works. The rest is a catalogue of places, with their latitude and longitude (to 12th of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places—by latitude (mēkos) and longitude (platos)—with the calculation of the size of the sphere of the earth, and of the extent of surface then known. These were calculated from Eratosthenes and Hipparchus, and most of the world; but he counted it only 24 degrees W. of Cape St. Vincent, instead of the true distance, 9° 29'. He took the parallel of Rhodes for his chief line of latitude, thinking it would give the most central position in the earth, the climate into which he divided the earth. He describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He also constructed a series of maps of the earth, and his map of the real map of the world, in illustration of his work. See Map.

The Ptolemaic System of astronomy, so called from Ptolemy, its chief expounder, was really originated long before his time, and was, in fact, merely an attempt to reduce to a scientific form the conceptions and primitive notions concerning the motions of the heavenly bodies. It was implicitly adopted by Plato, Aristotle, Hipparchus, and (with the exception of the Pythagoreans, and probably of Pythagoras himself) all the eminent philosophers of ancient times; passing from them to the Byzantine astronomers, who, especially the latter, were the means of disseminating it through western Europe, where it continued to be the universally established doctrine till the 16th century. The primary and fundamental doctrine of Ptolemy was that the earth is the centre of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having previous to any accurate observation, established themselves as unquestionable axioms, phaenomena which were found on closer examination to be inconsistent with them were explained by the introduction of additional hypotheses. The belief that the earth is the centre of the universe was supported by its accordance with the relation of the principal planets to the material world was supposed to be composed. Thus, earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, either being supposed to extend its influence by some others. In or beyond the other element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest enclosing the earth and its superincumbent elements, and the larger spheres enclosing the smaller. This is the whole of the heaven, and the universe, body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the Sun, Mars, Jupiter, Saturn and the fixed stars, eight in all. To this system later astronomers added a ninth sphere, the motion of which should produce the Precession of the Equinoxes (q.v.), and a tenth to cause the alternation of day and night. This tenth sphere, however, was valueless to Ptolemy, who wished to revolve from east to west in twenty-four hours, and to carry the others along with it in its motion; but the Ptolemaic astronomers do not venture to explain how this was done, although, since the axis of the earth is inclined to the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens increased in accuracy it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit is only apparent, and results from the earth not being in the centre of the sun's sphere, C (see fig.), but at E, and consequently at any point to be slowest at P and quickest at R. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystalline, but in a small circle, whose centre was a point in the crystalline, and which revolved on its axis as it was carried round with the latter; thus (fig.) the planet was carried round the small circle ABD, as that circle was carried round HQR (now supposed to represent the planetary crystalline). The planet while in the outer portion of its small circle would thus have a forward, and in the inner portion a backward motion. The larger circle was called an eccentric, and the smaller an epicycle. This theory of epicycles and eccentrics satisfied the early astronomers; but further investigation showed its incompleteness, and in later times it was found necessary to explain newly-discovered discrepancies by heaping epicycle upon epicycle till a most complex entanglement resulted. As soon as astronomers came to understand and test the Copernican Theory (see COPERNICUS), this venerable and disorderly pile of hypotheses, which had received the papal seal of infallibility, and had in various forms held supreme sway over the minds of men for twenty centuries, at once crumbled to atoms and sunk into oblivion. See Astronomy.

The Almagest and the Geography were the standard text-books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the 16th century showed its deficiencies. They have passed through numerous editions, the best of which are, for the Almagest and the most of Ptolemy's minor works, that by Halma (Paris, 4 vols. 1815-28); and for the Geography, the Latin version of 1482 and 1660, published at Rome, the edition princeps of the Greek text by Ermusius (1533), the Elzevir edition (1619), those of Wilberg and Grasbig (1644), Nobbe (1845), Müller (Paris, 1883), and the photographic reproduction of the MS. in the monastery of Mount Athos by Langlos (Paris, 1860). The catalogue of stars has been frequently reprinted separately, the best edition being that of Francis Daily, in vol. xii. of the Memoirs of the Royal Astronomical Society (1529).

Ptolemaeus, it has been known for a very long time that food which has undergone putre-
faction may, under certain circumstances, act as a violent poison, setting up severe catarrh, and producing symptoms of a more general nature. Stale meat, fish, and vegetables have gained a popular reputation on account of their poisonous qualities. A ptomaine was first obtained by Marquardt in 1865, and described by him as similar to conine; in 1869 Sülzer and Sonnenschein isolated a crystallizable ptomaine which resembled in its qualities acetone. In recent years attention has been called to this question from another point of view, and one of special interest to the medical jurist. At a trial at Rome, on the occasion of a supposed murder, a material was extracted from the body which had markedly poisonous qualities similar to those of delphinine. It was supposed by those who undertook the prosecution that this poison had been administered to the deceased, but on the side of the defence it was pointed out that the extract, though similar in some respects to delphinine, was in others quite distinct, producing on the frog's heart very different effects.

Attention having been called to the subject, scientific investigators, especially those of Italy and Germany, busied themselves in extracting these poisonous materials, ptomaines (Gr. πτωμα, 'a corpse'), from putrescent animal matters, and investigating their chemical and physiological properties. These ptomaines can hardly be said to form a very distinct group of bodies from a chemical point of view, for some, like putrescine and cadaverine, are amines; others are amino-acids, like creatinin and neurine, which has choline and muscarine closely allied to it, is trimethyl-vinyl ammonium-hydroxide. It is even questionable whether they may be said to possess an alkaline reaction, at one time supposed to be a common property of all ptomaines, and one which related them to the vegetable alkaloids, for Salkowski has recently shown that creatinin, a body that has been long known and apparently carefully investigated, when obtained pure gives no reaction with litmus-paper, nor does it possess the power of combining with acids like a base. Bieger, too, has pointed out that it is scarcely possible to look upon putrescine and cadaverine as true acting agents, since many of them, especially those rich in oxygen, are deficient in this power.

Neither from a physiological point of view can we look upon the ptomaines as sui generis, and in the first case because many of them are produced by the reproductive organs, *during menstruation*. In the second, well-known examples let us instance creatinin and neurine, which are produced every day in our living bodies, showing that during the putrefactive process we cannot be said to find substances which stand alone, and are invariably different from those formed during digestion and assimilation. Finally, in respect to their poisonous properties, not only are some of them perfectly harmless or poisonous only in a minor degree, but it is highly probable that some of the most poisonous products of the action of putrefactive and other organisms are bodies (alumines) of quite a different chemical constitution. It is therefore probable that in a few years, when more positive information is at our command, the term ptomaine will either be dropped altogether or restricted in its usage. In the meantime scientific men are actively investigating the subject, and a number of involved problems of chemical physiology and preventive medicine.

See Selmi, *Sulla Ptomaine ed Alkoloidi Calvnerici* (Bologna, 1878); Fanum, 'Das patrige Gift, die Bac terien' (Virchow's Arch., Bd. 60, § 301); Nenczi, "Zur Geschichte der bisherigen Pflanzenprodukte" (Journ. f. praxis Chemie, Bd. 21); Brieger, "Über Ptomaine" (Berlin, 1885); also the article *PTOMIA*.

**Ptohis** (from Gr. ἱππό, 'a fall') signifies a dropping or falling of the upper eyelid, and arises from weakness of the muscle which elevates it, or from pressure of a third or motor oculi nerve. If it is congenital, or occurs as an accidental cause, and resists medical treatment, it may be removed by a surgical operation, by which the eyelid is brought under the action of the oculi-frontal muscle, which receives its nervous power from another source.

**Ptyalin, PTyalism.** See *SALIVA*.

**Puberty** is the period of life at which the reproductive organs in both sexes begin to function normally and is marked by a series of changes in the structure and functions of the body. Among the peoples of northern Europe it begins in girls at from twelve to fourteen, and in boys about two years later. In girls both growth and development are about this period more rapid than in boys; the breasts enlarge, and the figure becomes full; the temperature changes; and the menstrual flow begins to appear. In boys the most obvious changes are the breaking of the voice and the growth of hair on the face. The changes begin at this time are not fully completed for the physical and mental life of adult life is established for at least eight or ten years after the commencement of puberty. The health during this period is specially liable to be disturbed by adverse influences, particularly in the female sex; and overstrain, both of the physical and mental powers, should be carefully guarded against.

**Publicani** (from Lat. publicum, 'that which is public or belongs to the state'), the name given by the Romans to those persons who farmed the public revenues (*vectigalia*). These revenues were put up to auction by the censors, and were 'sold' for a period of five years. They were derived chiefly from tolls, tithes, harbours-duites, the tax paid for the use of public pasture-lands, mining and salt duties; and from the special taxes they collected, publicani were classified as decumiani, pecunarii or scriptarii, and condutores portariorum. As the state required them to give security for the annuity which they had prevailed the collection of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies (*societates*) were formed, the members of which took each so many shares and were thus enabled to carry on conjointly undertakings far beyond the power of any single individual to undertake. Every society had also a head-delegate (*understater*), who resided at Rome, and transacted all foreign correspondence with the inferior officers who directly superintended the collection of the taxes. The publicani belonged to the order of *equites*, and formed from their immense profits a powerful capitalist class. Under the empire the land-tax and poll-tax came to be collected by officers of state—in senatorial provinces, the quasestor; in imperial provinces, an imperial procurator assistant to the governor; while in provinces like Judea, administered by an equestrian, the governor himself was himself at the same time procurator. The customs, on the other hand, even in the days of the empire, were still commonly leased out to publicani, and so undoubtedly in Judea. No doubt territorial princes like Herod Antipas also employed this method of collecting their tribute, much higher and more exacting than the publicani's. The lessees again had their subordinate officials, who would usually be chosen from the native population. But even the principal lessees in later times were not necessarily Romans. Zacechus, the tax-gatherer of Jericho (Luke, xix, 1, 2), was a Jew. The tariffs were often very indefinite, opening wide the door to arbitrariness and rapacity. Hence in New Testament phraseology the terms *publicani* and

Puccinottl, Francesco, author of the Storia della Medecina and of other works which give him a high place in medical literature, was born at Urbino in 1794, and, thanks to the Scopoli Fathers, was already an accomplished classical scholar when in 1811 he repaired to Pavia for a thorough course of mathematics, physics, and natural science, in which metaphysics, ethics, and civil and canon law were neglected. In these studies he passed on to that of medicine at the Roman University, and graduated with much distinction in 1816. The local malaria first engaged his attention. A work ardently opposing the prevalent Brunonian doctrine, and advocating a return to the rational medicine of Hippocrates, produced a salutary effect on his contemporaries, and was followed up by his able treatises on Pernicious Fever (1821) and on Inductive Pathology (1828). Academic honours now fell thick on him, and he passed from one medical name till, committed in the patriotic movement of 1831, he was deposed from the professorship of Pathology in the university of Macerata. Excluded from academia, he redoubled his literary activity, which bore fruit in his still classic treatises on medical jurisprudence and on law and public health and by these he earned himself an international reputation. In 1833-37 he made a special study of the cholera epidemic at Leghorn, at the same time giving to the world his masterly translation of Arcturus. In 1838 the Tuscan Archduke appointed him professor of Medical Jurisprudence in Pisa University, and there he published his Lezioni Speciali su Medicae Nervosi, his work on the Cachexie, and on the maladies induced by the rice-culture (Risisce) and, and above all, his masterpiece, the Storia della Medecina, in three volumes, representing the labour of twenty years. He died, 8th October 1872, in Florence, and, by special decree of the municipality, was buried in the 'Westminster Abbey of Tuscany,' the church of Santa Croce.

Puck, or Robin Goodfellow, a familiar figure in the fairy-world of old English folklore, immortalised by Shakespeare in the Midsummer Night's Dream. His characteristics, as kept alive by popular tradition in the merry tricks and mischievousness attributed to him, the name is really a generic term for a fairy, and we recognise it further in the Icelandic pucki, the Irish pooco, the Welsh pwyca, even the Cornish pizye, and the Puck and Nisse Puck of the Frisians and Danes. Pucke occasionally perform kindy domestic functions, are small and dwarf-like in appearance, attach themselves to particular households, and are easily propitiated by offerings of cream and kindly names like the Irish 'good people,' the Scots 'Puckie,' or a Norwegian 'Puk.' They occasionally assume the form of a horse, a hound, or the like, and are even confounded with such dancing lights as the Will-o'-the-Wisp or Jack o' Lantern. Obvious analogies suggest themselves with the Silesian Rubezahl, the Scotch Brownie, the Norse Troll, whose more malignant aspects connect them with the wider world of Demonology (q.v.). Robin Goodfellow once filled a prominent place in the popular imagination—we meet him at full length in the 1628 black-letter tract, Robin Goodfellow; his mad pranks and sly merrie way of haunt mort, and is a fit medicine for wantonly (repr. in Halliwell). Henslowe's Diary tells us that Chettle wrote a drama on his adventures; we find him again in Drayton's Nymphidia, Burton's Anatomy of Melancholy, Ben Jonson's Masque of Black Barts, and the Plays of Shakespeare. As Lob, Hobgoblin, and the Lubber-foend the allusions to him in our earlier literature are endless. The name Puck was taken for its title by the well-known New York counterpart to Punch.

See J. O. Halliwell's Illustrations of the Fairy Mythology of A Midsummer Night's Dream (Shakesp. Soc. 1845); W. J. Thoms's Three Notebooks on Shakespeare (1865); and W. C. Hazlitt's Fairy Tales, &c., illustrating Shakespeare and other English Writers (1875).

Pudd, or Pood, a Russian weight which contains 36 lb. avoirdupois (40 lb. troy). See Pound.

Puebla, the third city of Mexico, capital of a state of the same name, stands on a fruitful plain, 7120 feet above sea-level, and 68 miles (by rail 116) S.E. of the city of Mexico. In the vicinity are Orixala, Popocatépetl, and other lofty mountains. It was founded in 1561, and declared the handsomest towns in the republic, with broad, straight, clean streets; many of the houses, which are generally three stories high, have quaint fronts of red and white tile-work. The city contains nearly fifty churches, theological, medical, art, and normal schools, and museums of science, with museums of natural history dates from 1728, two large libraries, a number of hospitals, &c. On the great square stands the cathedral, a Doric building with two towers, the interior of which is decorated in the most sumptuous manner with ornaments of gold and silver, paintings, statues, &c. Puebla has a thriving trade, and an air of cheerful activity, not common in Mexico, pervades the place. In 1898 there were twenty-two factories; the chief articles produced are cottons, paper, iron, glass, porcelain, leather, &c. See Pop. (1905) 91,917.

Pueblia, capital of Pueblo county, Colorado, on the Arkansas River, at the mouth of Fountain Creek, 117 miles by rail S. by E. of Denver. Through its iron and steel industry it has rapidly become the second city of the state and an important railway centre; immense quantities of raw materials and fuel abound in the vicinity. The principal establishments are those of the Colorado Steel Company and Iron Company, which include two blast furnaces, steel-works, a rail-factory, bar- and nail-mills, and a pipe-foundry. In 1890 a Mineral Palace was erected to hold a permanent exhibit of Colorado's mineral productions—from stone and coal to pure gold—valued at almost $1,000,000. Pop. (1880) 3089; (1900) 24,747.

Pueblos (Span. pueblo, 'village'), a semi-civilised family of American Indians in New Mexico and Arizona, dwelling in large single habitations, which are sometimes capacious enough to contain a whole tribe. These edifices—which are often five stories high and 300 feet square—stretch over 433 yards long, with many rooms (53 to 124) on each floor—are commonly constructed of adobe or sun-dried brick; the ground-floor is invariably without doors or windows, entrance being effected by a ladder leading to the second story; and
indoors ladders take the place of staircases everywhere. A somewhat pyramidal aspect is given to the whole building by each successive story receding a few feet from the line of that below it. Each family in the town has a separate apartment, and there are also large rooms for general council-chambers and for tribal dances. In New Mexico there are nineteen such villages, with over 800 occupants, who are skillful agriculturists, employing irrigated districts in the cultivation of wheat, corn, potatoes, and beans. Spinning and weaving and the manufacture of pottery also are carried on. The Moquis of Arizona are a related tribe, numbering some 1800, in seven villages built on the summit of isolated hills. The Pueblos are under Roman Catholic missionaries, and are making steady progress in civilization and education, although on their Christianity they have grafted many of their old pagan beliefs and customs, to which they obstinately cling. They were first visited by the Spaniards about 1530, at which period their habits and their occupations were very much the same as to-day. It is evident, however, from the wide area over which the ruins of old pueblos and remains of ancient pottery have been found, that they were at one time very much more numerous than they are now.

**Pueblos National**, a town of Colombia, in Santander department, on the Rio Suarez, Coal and iron, and there are some trifling manufactures. Pop. 12,000.

**Puerperal Fever.** In its most general sense this term may be applied to any acute febrile disease affecting women during the puerperal or lying-in state. In this sense it might be taken to include the febrile states induced by the poisons of scarlatina, typhus, and other zymotics. But, while the zymotic poisons induce manifestations in the puerperal woman in some respects widely differing from the results of their action in the non-puerperal state, their features are quite distinct and recognizable, and the special characteristics of their action depend on the peculiar condition of the subject for the time being, and not on any difference in the specific character of the poisons. The term puerperal fever is now in its narrower sense restricted to that special acute febrile disease resulting from the septic infection of the puerperal woman, and may be considered to be synonymous with the term puerperal septicemia.

It is a frequent and much dreaded disorder, and accounts for a very large number of the deaths arising from child-bearing. Its dread character and symptoms were recognised by Hippocrates and by him regarded as due to the suppression of the lochia or discharge after childbirth—a view which held ground for nearly 2000 years—for in 1660 Sydenham taught practically the same opinion, from this time until 1847 various views as to its cause and nature prevailed. But in this year the true nature of the cause was recognised by Sumner of Oxford, who noticed that in a clinic in the maternity which he conducted, and which was attended solely by midwives, puerperal fever scarcely ever occurred, while in another attended by students, many of whom came straight from the dissecting-room, its ravages were almost universal. This led him to an analysis of his observations, that the students brought into the maternity a poison that induced in the women they attended and examined the disease, which was conspicuous by its absence in the clinic and attended by the midwives only. Abundant evidence has accumulated since that time, his views were correct, and it has been shown that of all the causes of this malady the poison termed "cadaveric" (i.e. derived from the decomposing dead body) is one of the most active and fatal. Modern research has shown us that the activity of this and other septic poisons is due to the influence of microbe organisms which act upon "cadaver," and we have reason to believe that a great variety of such germ-bearing substances exist, each capable of inducing the symptoms and condition which we recognise under the name of puerperal septicemia. Thus, while the results are to all intents the same, the causes may vary considerably in degree and nature. This poison-germ may be derived from a variety of sources; for example, the cadaveric poison already referred to, the pus from a septic abscess, sewage gas, &c. It would seem that the septic poison may be introduced into the system in two different ways, and this distinction has an important clinical and practical bearing.

1. The so-called Heterogenetic mode includes those cases in which the poison is applied to the tissues of the patient directly, as from the hands of the accoucheur. The microbe then enters the tissues and produces its effects by developing in and influencing the vitality of the tissues themselves.

2. The so-called Autogenetic mode. In this case a piece of the retained placenta, blood-clot, or slough remains in the genital tract. Putrefactive changes set in as the result of microbial infection, and the products of the putrefaction enter the system and act on the patient's system, and so on.

This is the case when the patient was as it were manufactured the immediate poison in her own body (hence the term). But it will be evident that in both the ultimate cause is the presence of microbial organisms. The symptoms may occur in from four days to three weeks after labor, accompanied by a rigor or 'chill,' followed by a rapid rise of pulse and temperature. Thereupon pain in the abdomen usually sets in and the lochia becomes fetid or suppressed. The local manifestation of the disease consists of inflammatory changes varying in kind, degree, and site. Almost all the organs may be involved, more especially the uterus, peritonium, kidney, liver, &c. In some cases the influence of the poison is so overpowering and rapid that death ensues before any gross change in the tissues occurs, but usually there is abundant evidence of the extent of the pathological changes.

Once the disease is fairly established the prognosis is grave in a high degree. The chances of recovery where the treatment is appropriate and vigorous are very much greater in the autogenetic variety than in the heterogenetic. The septic poison can be attacked, and the decomposing matter either entirely removed, or the putrefactive process stopped by the use of efficient antiseptics. Where the sepsis has been introduced directly (heterogenetic form) the possibility of direct interference is almost nil, and the matter resolves itself into a contest between the vitality of the victim and the activity of the poison, in which the former often succumbs.

The preventive treatment (prophylaxis) of this scourge is, however, one of the triumphs of modern medicine. Up to 1870 the special home of puerperal septicemia was the maternity hospital, and the atmosphere and furniture were saturated with the septic material derived from the emanations and excreta of previous patients. Such institutions were seldom long free from outbreaks of this scourge, and from time to time epidemics arose with their attendant virulent and virulent death-rate. After many cases of this character were examined, and all the known agencies eliminated, it was shown that the perils were still not nil. No better illustration of this advance can be found than the experience in the Royal Maternity Hospital of Edinburgh. In 1879 the new
PUERPERAL INSANITY

PUERTO DE SANTA MARIA 483

hospital was opened, and though it was constructed on the most advanced sanitary ideas several fatal cases occurred during the first three or four months after its opening. The source of the mischief was not discovered; this is the prevalent disease, when an antiseptic course was instituted in the management of the practice, and since then no single case of septicemia has occurred.

A similar result has been attained in the great maternity hospitals on the Continent, and indeed it defies remark, that the two most distinguished institutions in the world—the Great Maternity Hospital of London and the hospices of Geneva—have both been entirely free from this disease, since antiseptic practice has been adopted. The antiseptic practice more nearly perfect is the immunity from the disease. In no department of practical medicine have the discoveries and teachings of Lister produced more brilliant results. For while it might well have been said that until recently a woman entering a maternity hospital took her life in her hands, it now appears that since antiseptics in midwifery have been rigorously adopted a woman is actually safer in such an institution than in her own home. For while careful antiseptic practice is practically a routine in the hospital, it is apt to be faulty in a private house by reason of some constructional fault in the dwelling or ignorance or carelessness on the part of the attendants. And thus, while septicemia is practically stamped out of hospital practice, it is still far too frequent in the private house.

The chief points attended to in hospital practice are: (1) The thorough cleanliness of the bedding and clothes of the patient—all soiled articles being at once removed and disinfected before being washed. (2) The scrupulous cleansing of the wounds and the prompt and thorough dissection of the extreme personal cleanliness of all attendants—accoucheurs and nurses—the hands being carefully disinfected on every occasion before a patient is touched. (4) The rigid exclusion from the clinics of all who have been in attendance on infectious or septic cases or in the post-mortem or dissec ting rooms. (5) The prevention of septic absorption by the free use of antiseptic lotions and dressings. While such practice can, with due care, be constantly maintained in hospital, it is obvious that the conditions of private practice render its application more difficult; and while antiseptics have rendered the disease immensely less frequent, it is doubtful if we can hope for the almost complete immunity in private which we have attained in hospital practice.

Puerperal Insanity comprehends the forms of mental derangement which may attack a woman during or after pregnancy, childbirth, and the puerperal period. The occurrence of insanity during pregnancy is extremely rare; it is much more frequent during the early puerperium, and is liable to occur, but with less frequency, during the whole period of lactation. The affection presents many varieties, such as acute mania (which is probably the commonest), delusional mania, melancholia, &c. As regards frequency, it would seem that about 8 per cent. of all cases of insanity have a puerperal origin. This is derived from a very large number of cases, and the frequency in different places varies greatly. A very large proportion of the cases show a hereditary tendency to insanity, but it occurs to a great extent among those in whom no such taint can be recognised. Primiparas are more frequently the victims than those who have borne several children, and there seems no doubt but that it is more apt to appear in those whose physical state has become depressed from one cause or other.

Illegitimacy seems to exert a potent influence in the production of the disorder. This comes out in Clouston's statistics. He says that 25 per cent. of all insane puerperal women are unmarried. This apparent close relation may be somewhat misleading, because while these unfortunate are no doubt the subjects of great mental distress, and often of physical hardships leading to lowered vitality—conditions which certainly favour the development of this disorder—yet it must be borne in mind that nearly all cases are derived from the shelter of lying-in hospitals, from whose wards the statistics are chiefly derived. It may generally be said that a depraved state of the nutritive system precedes attacks of insanity, and whatever tends to induce this favours the development of an insane attack. The treatment of the attacks already become acutely maniacal. There is great excitement, incoherence, and often great and dangerous violence. There is continuous garrulity, and the language is frequently markedly profane or obscene. Violent explosions occur from time to time, often characterised by homicidal and suicidal tendency.

The melancholic form is characterised by an attitude and expression of great mental depression, speech is slow, and replies can only be elicited with difficulty. The eyes are lustreless and downcast, and the whole bearing suggests profound dejection. Suicidal attempts are not uncommon in the melancholic forms, and must always be guarded against. The symptoms usually appear within the first seven days after labour, and may develop with great rapidity. In both the melanocholic and maniacal forms there is a tendency to inversion of passions, the temper becomes coated, and the secretory and excretory functions are greatly disorders. Sleeplessness is very pronounced, and hysterical outbursts, delusions, and hallucinations occur, and mania or melancholia rapidly supervenes. It is satisfactory to know that in spite of the violence of this disorder the chances of ultimate recovery are very great. Upwards of 80 per cent. recover entirely.

Most of the maniacal cases get well within eight weeks, the melancholic within six months. In a small proportion of the cases recovery is deferred until nine months, after which the chances of complete recovery are considerably diminished. In this connection it should be noted that the rapidity of recovery depends on appropriate treatment being early begun. Experience shows that the majority of cases in which treatment is early begun get rapidly well, and that the chances of recovery are diminished in proportion as the treatment is deferred. Repugnant then as may be the removal of the patient to an asylum, there can be no doubt that, in the great majority of cases, this is the proper course to be pursued. With the fact that most of the cases have a suicidal or homicidal tendency which it is often difficult to guard against in a private house, and at the same time understands that early recovery depends on early treatment, the propriety of the patient's early removal scarcely admits of question.

See Clouston, Mental Diseases; Bevan Lewis, Textbook of Mental Diseases; Lloyd, 'On Insanity and Diseases of the Nervous System in the Child-bearing Woman' (American System of Obstetrics, vol. ii.).

Puerto Bello. See PORTOBELLO.

Puerto Cabello, a seaport of Venezuela, in Carabobo state, 78 miles W. from Caracas. It stands on a low, narrow peninsula on the Caribbean Sea, and has a safe, deep, and roo my harbor, defended by a fort and batteries. It is the port of Valencia, which is 34 miles distant by rail. There is an active foreign trade, which averages 12 or 13 millions sterling annually; the chief exports are coffee, cacao, cudi, cotton, sugar, divi-divi, and copper ore. Pop. 10,143.

Puerto Cortez, a port of Honduras (q.v.).

Puerto de Santa Maria, a seaport of Spain, stands at the mouth of the Guadalate, on the Bay of Cadiz, 22 miles by rail (all round the bay) NE. of Cadiz and 8 SW. of Xeres. It is one of the
principal export harbours for sherry, and manufactures silk, soap, hats, leather, spirits, beer, &c. The bull-fights here in May are among the most famous in the country. Pop. 22,125.

Puerto Plata, the chief port of the Dominican Republic, on the north coast of the island of Hayti. It has an open roadstead, but exports a good deal of tobacco, mahogany, sugar, coffee, cocoa, divi-divi, &c. The value of imports and exports varies from £230,000 to £300,000 a year. Pop. 6000.

Puerto Príncipe, a city of Cuba, 50 miles by rail W. of Nuevitas, its port on the north coast. It is the centre of a grazing and cattle-raising country, and is the largest inland city of Cuba. Pop. (1899) 25,102.

Puerto Rico. See Porto Rico.

Puff-adder (Clotho or Echis du aritana), one of the most venomous and dangerous vipers of South Africa. Its popular name refers to its habit of puffing itself up when irritated. It attains a length of 4 or almost 5 feet, and is often as thick as a man's arm. Its head is very broad; its tail suddenly tapered; its colour brown, chequered with dark brown and gray or white. The puff-adder is very sluggish, and often lies half buried in the sand of the desert, its head alone being raised above ground. Its poison is used by the Bushmen for their arrows. The River-jack (Clotho musiciar
tus) is also South African; the male bears a scaly spine between the nostrils.

Puffball (Lycoperdon), a Linnean genus of Fungi, now divided into many genera, belonging to the section Gasteromycetes. They mostly grow on the ground, and are roundish, generally without a stem, at first firm and fleshy, but afterwards powdery within; the powder consisting of the spores, among which are many fine filaments, loosely filling the interior of the peridium, or external membrane. The peridium finally bursts at the top, to allow the escape of the spores, which issue from it as very fine dust. Some of the species are common everywhere. Most of them affect rather dry soils, and some are found only in heaths and sandy soils. The most common British species is L. gemmatum, generally from one to two and a half inches in diameter, with a warty and mealy surface. The largest British species, the Giant Puffball (L. giganteum), is often many feet in circumference, and filled with a loathsome pulpy mass when young; but in its mature state its contents are so dry and spongy that they have often been used for stanching wounds. Their fumes, when burned, have not only the power of stupefying bees, for which they are sometimes used, in order to the removal of the honey, but have been used as an anaesthetic instead of chloroform. The same properties belong also to other species. Some of them, in a young state, are used in some countries as food, and none of them is known to be poisonous.

Puff-birds (Bucerotidae), a family resembling Kingdoms in form, but living on insects like Flycatchers; they also resemble the Bee-eaters, and are found only in South and Central America. See BARBIER, and Selater's Monograph of the Jacamars and Puff-birds (1882).

Puffendorf, Samuel, Baron von Puffen-dorf (or Puffendorf), writer on jurisprudence, was born on 8th January 1632. at Chemnitz, in Saxony. He began the study of theology at Leipzig, but in 1656 went to Jena to study national law and mathematics. Whilst acting as tutor to the sons of the Swedish ambassador at Copenhagen war broke out (1658) between Denmark and Sweden, and Puffendorf was thrown into prison. During the eight months he was kept there he thought out his Elementa Jurisprudentiae Universitatis. It was dedicated to the Elector Palatine, who appointed Puffendorf to the professorship of the Law of Nature and Nations at Heidelberg.

He next exposed the absurdities of the constitution of the Germanic empire in De Statu Republicæ Germanicae (1667), which raised a storm of controversy. In 1670 he was called to fill the chair of the Law of Nations at Lund, and there wrote the work on which his fame now rests, De Jure Naturæ et Gentium (1672), a work based upon the system of Grotius (q.v.), but completed and extended in the line of Hobbes' speculations. Some years later the king of Sweden made him his historiographer, with the dignity of a councillor of state. In his official character he published a dry history of Sweden, from the expedition of Gustavus Adolphus into Germany to the death of Queen Christine. In 1688 the Elector of Brandenburg invited him to Berlin to write the history of the life and reign of the Great Elector. He died in that city on 20th October 1694.

See Lorimer, Institutes of Law of Nations (vol. i. 1883); H. von Treitschke, in Preussische Jahrbücher (1875); and Droysen, Abhandlungen zur neueren Geschichte (1887).

Puffin (Fratercula), a genus of birds of the Auk family, characterised by a gaily-coloured bill—red, orange-yellow, and bluish gray—with a horny frontal sheath divided by transverse grooves into several distinct pieces. At the end of the breeding season these furrows deepen, and the sheath is shed. There is in fact an annual moult of the bill-sheath and of the horny plates above and below the eyelids. In form, size, and colour the new bill-sheath differs markedly from the old one. The genus Fratercula embraces three

Puñían (Fratercula arctica).
species, of which only one, the Common Puffin (F. arctica), a bird a little larger than a pigeon, frequents the rocky shores of the Atlantic Ocean. It occurs in many parts of England and in Wales, while on the coast and islands of Scotland and Ireland—it is often abundant. A similar state of things occurs in the breeding season, when the birds congregate in large colonies. The egg, which is of a dull white marked with pale brown or lilac, is laid sometimes in a crevice of a cliff, sometimes in the burrow of a rabbit, or in a cavity made for the purpose. The nest, which is covered with scotty blackdown, remains in the nest for three weeks, and is fed on small fishes. The adult birds feed on crabs, crabs and other marine animals. On land they waddle rather than walk, but they swim and dive well, and their flight is rapid though seldom high. In various localities the puffin is popularly called "Sea-parrot," "Coulternb," and "Tammienorie." In the Pacific the genus is represented by the Horned Puffin (F. corniculata). There also is found the closely allied genus Lunda, with bright yellow bill. The legs of the puffin are naked and provided with a fan of the young birds is used as food. For details as to the strange moulting and renewal of the bill, see Zoologid (July 1878).

**Pugilism.**

This breed of dog is generally supposed to have been brought over from Holland, where it is very common. Its origin there is unknown. The pug may be described as a miniature bulldog, though it differs in the shape of his ears, which should fall forward like a terrier's, and of his tail, which should curl tightly against his quarters. The broad under-jaw and wide skull of the bulldog are rarely seen, but should be present in a perfect specimen. Some years prior to 1860, when the race was for the first time exhibited, Mr. Morison of London and Lord Willoughby d'Eresby paid great attention to the breeding of pugs, and founded two distinct strains known as the Morison and Willoughby pugs. Large prices were paid for pure specimens of either strain, but when the fashion in ladies' dogs took another direction prices came rapidly down. The two strains have been so often recrossed that it is difficult to obtain a pure specimen now. The pug is only fit for a house-dog, as he is useless for any active work. Beyond a ten-pound package he is well provided for this, as his short, smooth coat is easily cleaned, and he is a handy size.

**Pugnacous.**

To trot as our ancestors did. A special explanation is required to show what boxing is; every one knows that it is fighting—real or mimic—with the hands alone, all weapons being foreign to the "science." As pugilism, in what has always been its highest standard—prize-fighting—is now supposed to be our national sport, it is perhaps to give a brief sketch of its past, when it played a more important part—or was thought to do so—than it does now in the formation of the national character.

Although now the taste for it seems quite as firm and as general in the United States, England has been emphatically the home of pugilism; and it is certain that in no other country at any time was such a fair, manly, and humane system of combat established as that under which the English settled their quarrels, especially after the rules of the prize-ring were issued. These, known now as the "old rules," dated from the time of the first recognized champion of England, in whose name they were framed to regulate a new and popular form of piping, and as a necessary consequence, in all others, the P.R.—an accepted abbreviation for Prize Ring—being the standard authority in such matters, the royal academy of athletes, as it were. This was soon after 1740, and the rules held good for nearly a century; and although they were revised, entirely in the direction of diminishing the danger of such contests. At the same time it should be remarked—and those unacquainted with the subject may possibly be surprised to learn—that fatal results to prize-fights were extremely rare, and in most instances occurred through what may be termed accidental or secondary causes. In Broughton's rules "minute time" was allowed between the rounds—each bout of the struggle being called a "round," and lasting until one or both of the men were down; but this was altered in the new rules to a minute or two. The rules were so framed that if a man could not recover himself sufficiently in that time to face his antagonist he must be so weak or stupified that further fighting would be dangerous. In Broughton's time, too, the second man was allowed to show his principles to the "scratch;" this was forbidden by the new rules on the same grounds as the previous alteration. The purpose of both sets of rules was to secure fair-play and to foster a kind of rude chivalry, objects not without value when we remember the principles most of the men were taught under their influence, and the angry quarrels either code was intended to regulate. No man was to be struck while he was down; and no man might be struck below the belt—the belt in practice being a handkerchief tied tightly round the waist. With prize-boxers these handkerchiefs were the "natures" of the men, chosen by themselves and worn by their partisans. Kicking, biting, and the horrible "gogging"—once so frequent across the Atlantic, but now happily seldom heard of, owing to the spread of pugilism—were all "foul," and their practice instantly lost a man the box; if two rounds, were two seconds, or, as they were sometimes called, bottle-holders, to each man: their duty was to lift their principal when he fell; to carry him to his corner—always selected by tossing a coin, the winner of the toss naturally choosing the corner of the ring which placed him with his back to the sun; to sponge or sprinkle him with water; to wipe the perspiration or blood from his face; and, as their second title implies, to refresh him with sips from the water or brandy bottle. They used also to carry in their jacket pocket a supply of powdered resin, which the boxer would rub on his hands to enable him to clench them tightly when he grew tired; but this practice was made "foul" by the new rules. The "scratch," to which allusion has been made, was a mark in the centre of the ring which the combatants instantly lost a man the box; to give vent anything like a sudden rush by either of the men upon his unprepared face. The "ring" itself was a square of 24 feet, marked out by four corner and four middle stakes, round which ran two ropes at a height from the ground of 2 and 4 feet respectively.

For many years prize-fighting maintained an enormous popularity, and an existence which, if not actually legal, was scarcely to be distinguished
from it. The popularity perhaps remains, but the legality or the want of it is so settled that the P.R. is generally regarded as a thing of the past; and even boxing may be prohibited. "Boxing" was once equivalent to "pugilism," the general term for "fistic" manoeuvres, but is now almost exclusively used for contests with pugilist's gloves. These, of course, are used to prevent the injuries which the naked knuckles might inflict, although a very respectable amount of punishment can be dealt out with the largest gloves. Broughton was followed by a series of champion contests, the most famous were fought by John Jackson (1769-1845)—known as Gentleman Jackson; John Bogle; Tom Cribb (1751-1848), the most fearless, honest, and simple-minded of gladiators; Spring; and Tom Sayers (1806-43), with whom the series practically closed. All these have been honoured with handsome monuments, especially Jackson and Cribb, who lie respectively in Bromley Cemetery (London) and Woolwich churchyard; while the funeral of Sayers was almost a national demonstration, the heterogeneous procession which followed being one of the largest ever seen even in London. Another boxer, John Gully (1785-1863), might have been champion, but he retired from the ring and actually became M.P. for Pontefract (1832-37), an owner of extensive coal-mines, and, what to many of his admirers was a fact of much relief, his racers thrice won the Derby; and he began life as a journeyman butcher! The popular idol at one time was Jack Shaw (1789-1815), the life-guardsman, a pugilist of herculean strength, but not so polished in science as some of his competitors. His patrons offered to buy him out of the regiment when it was ordered abroad, and to back him for the championship; but the heroic guardsman refused, and, with thousands of his comrades, fell in winning the crown of victory for his country. It is said that he killed, or almost killed, the Duke of York, in a prize fight. The great Duke of Wellington was his firm supporter; Sir Robert Peel and Lord Palmerston lent their influence to him, and Lord Byron, who was a pupil of Don Juan, George Borrow's fight with the "Fainting Timman" is truly Homeric; and he landed boxing as he landed all things English. Thackeray, too, whose nose is said to have been broken in a school fight with a very church dignitary, devoted one of his Roundabout Papers to the fight between Sayers and Heenan. It would occupy too much space to continue this catalogue of admirers, but did we do so it would show how different was the popular taste of thought not so very long ago.

Pugilism. The P.R. undoubtedly claim to have furnished an item in English history; for when the allied sovereigns visited London after the peace of 1814—the most important and brilliant gathering of potentates on record—it was deemed fitting by the English to display their art of boxing, supported by the best pugilists of the day—a display greatly admired by the visitors. A year or two later the Grand-duke of Prussia saw a prize-battle and shook hands with the victor. The Shah of Persia in 1823 was also greatly delighted with a similar exhibition. The result of all this was a display of the necessities of the establishment of police in every county of England, which rendered it well-nigh impossible to 'get a fight off;' the leading patrons of the sport withdrew disgusted at the continual disappointment, leaving the boxers to the influence of a very different set. From the absence of any legal restraint, there had always been danger of disorder and riot, to check which no adequate force could be provided; yet latterly such scenes grew more frequent and worse in character, so that the demand from its opponents for the suppression of the ring gained in strength, while the efforts of those who would preserve it were proportionately weakened.

As with most other extensively followed games, the prize-ring had a dialect of its own, a "flashing," a few specimens of which may amuse the reader. The fists were "mamlez," and when both boxers struck with the same hand at the same time, the blow was called, aptly enough, a "counter-hit," or only a "counter." When one struck with the right and the other with the left at the same time, the blow was a "cross counter." 'Countering' was the most exciting, and the severest mode of inflicting punishment.

In consequence of the police difficulties attending prize-fights on the old lines, they have gradually drifted into exhibition matches, in which the "gate" is an important factor. These fights are conducted under the Queensberry rules, so called from the marquess of Queensberry, to render boxing an elementary sport. They modify the conditions considerably, and so gloves are used (thickly stuffed, from 4 to 6 ounces in weight) they are nominally boxing contests and are presumably legal. They generally end in one of the combatants being "knocked out"—that is, rendered incapable of bearing up, upon which the referee continue the fight. A blow on the point of the jaw or on the heart or stomach is the usual method of accomplishing this end. They are generally conducted under the auspices of some athletic club on a platform enclosed with a 24-foot ring, a charge being made for admission. There are very popular in the United States, where the biggest fights have taken place, such as that in which Fitzsimmons beat Corbett in 1897, and when Jeffries beat Fitzsimmons in 1899. In the latter case the money drawn for admission amounted to $75,000 ($15,000), of which sum over £12,000 was divided between the pugilists.

O'Reilly, Ethics of British and American Sport; and Parker and Groves' Fencing, Boxing, and Wrestling (Bathminton Library, 1889); G. K. Allanson-Wilm, Boxing (Isthmian Library, 1897).

Puigin, Augustus Welby, architect, was born in London on 1st March 1812, the son of a French architect, Augustin Puigin (1792-1832), in whose office, after schooling at Christ's Hospital, he was trained, chiefly by making drawings for his father's books on Gothic buildings. Whilst working with Sir C. Barry he designed and modelled a large part of the decorations and sculpture for the new Houses of Parliament (1836-37). Early in life he became a convert to Roman Catholicism: and most of his plans were made for churches and other ecclesiastical edifices belonging to that communion, the most successful being perhaps a church at Ramsagate, Killarney Cathedral, Athlone Hall in Ireland, and the Roman chapel at Douai. He died insane at Ramsagate, on 14th September 1832. He enriched the literature of his profession by Contrasts . . . between the Architecture of the 15th and 19th Centuries (1836), a Treatise on Church Screens (1851), and The True Principles of Christian Architecture (1841). B. Ferrey's Recollections of A. W. Puigin and his Father (1861).

His son, Edward Welby Puigin (1834-75), succeeded to his father's practice, and was the architect of many Roman Catholic churches, &c.

Pulaski, Casimir, a Polish count who fell in the American revolution, was born in Podolia, 4th March 1748, took an active part in the war against Russia, and lost his estates and was outlawed at the partition of Poland in 1772. In 1777 he went to America, and for his conduct at the Brandywine was given a brigade of cavalry, which he commanded until March 1778. He then organised 'Pulaski's legion,' a corps of lancers and light infantry, in which he enlisted even prisoners of war and deserters. In May 1779 he entered Charleston, and held it until the place was relieved; a furious assault which he had made on the British was repelled, but he afterwards followed and harassed them until they left South Carolina. At the siege of Savannah on the 9th of October he fell in the assault at the head of the cavalry, and died on board the brig Wasp two days later. In 1824 Lafayette laid the corner-stone of a monument to Pulaski, in Savannah, which was completed in 1835.

Pulci, Luigi, an Italian poet, born at Florence, 3d December 1432, and died in 1454 (or 1457), was an intimate friend of Lorenzo de' Medici and of Politian. He is the author of a celebrated poem, Il Morgante Maggiore ('Margante the Giant'), a burlesque epic of which Roland is the hero. This poem is one of the most valuable sources for the early Tuscan dialect, the niceties and idioms of which have been borrowed by Pulci with great skill (see Italy, Vol. VI. p. 254). The first edition appeared at Venice in 1481, and the book has since been frequently reprinted. Pulci wrote further a humorous novel (printed in Classici Italiani, Milan, 1804) and several humorous sonnets.—His brother Bernardo (born circa 1430) wrote an elegy on the death of Simonetta, mistress of Julian de' Medici, and the first translation of the Eclogues of Virgil.

—Luca, another brother (born 1431), wrote a poem in honour of Lorenzo de' Medici's success in a tournament; II Cirillo Calvaniaco, a metrical romance of chivalry; Drino d'Amore, a pastoral poem; and Epistle Eroiche.

Pulex. See Flea.

Pulcent, a town of British India, 20 miles N. of Madras, the first settlement of the Dutch in India; pop. 4067. It stands on an island in a large inlet of the sea called the Lake of Pulcent.

Pulkowo, a village of Russia, 10 miles S. of the site of a magnificent observatory (59° 46' 18" N. lat. and 30° 19' 40" E. long.), the 'St Petersburg observatory,' built by the Czar Nicholas in 1828-30. In 1882 one of the largest telescopes in the world was erected here.

Pulley, one of the mechanical powers, consists of a wheel, with a groove cut all round its circumference, and movable on an axis; the wheel, which is commonly called a sheave, is often placed inside a hollow cylinder of wood called a block, and by the sides of this block the extremities of the axle of the sheave are supported; the cord which passes over the circumference of the sheave is called the tackle. Pulleys may be used either singly or in combination; in the former case they are either fixed or movable. The fixed pulley (fig. 1) gives no mechanical advantage; merely changes the direction in which a force would naturally be applied to one more convenient; thus, W can be raised without lifting it directly by merely pulling P down. The single movable pulley, with parallel cords, gives a mechanical advantage = 2 (fig. 2); for a little consideration will show that, as the weight, W, is supported by two strings, the stress on each string is \(\frac{1}{2}W\), and the stress on the one being supported by the hook, A, the power, P, requires merely to support the stress on the other string, which passes round C. The fixed pulley, C, is only of service in changing the naturally upward direction of the power into a downward one. If the strings in the single movable pulley are not parallel there is a diminution of mechanical advantage—i.e. P must be more than half of W to produce an exact counterpoise; if the angle made by the strings AB and DC is 120°, P must be equal to W; and if the angle be greater than this there is a mechanical disadvantage, or P must be greater than W. The following are examples of different combinations of pulleys, generally known as the first, second, and third systems of pulleys. In the first system one end of each cord is fastened to a fixed support above; each cord descends, passes round a pulley (to the lowest of which the weight, W, is fastened), and is fastened to the block of the next pulley, with the exception of the last end which passes round a fixed pulley above, and is attached to the counterpoise, P. The tension of a string being the same in all its parts, the tension of every part of the string marked (1) in fig. 3 is that which is produced by the weight of P; consequently, as the last movable pulley is supported on both sides by a string having a tension, P, the tension applied in its support is 2P. The tension of the string marked (2)

\[\text{Fig. 1.}\]

\[\text{Fig. 2.}\]

\[\text{Fig. 3.}\]

\[\text{Fig. 4.}\]

\[\text{Fig. 5.}\]

is therefore 2P, and the second movable pulley is supported by a force equal to 4P. It may similarly be shown that the force applied by the strings marked (4) in support of the last pulley (which is attached to W) is 8P. Hence we see that, according to this arrangement, 1 lb. can support 4 lb. if two movable pulleys are used; 8 lb. if there are three movable pulleys; 16 lb. if there are four movable pulleys; and if there are no movable pulleys 1 lb. can support 2 lb. It must be noticed, however, that in practice the weight of the cords, and of the pulleys, and the friction of the cord on the pulleys must be allowed for; and the fact that in this system all these resist the action of the power, P, and that to a large extent, has rendered it of little use in practice.—The second system is much inferior in producing a mechanical advantage, but it is found to be much
more convenient in practice, and is modified according to the purpose for which it is to be used; two prevalent forms are given in figs. 4 and 5. In this system one string passes round all the pulleys, and, as the tension in every part of it is that produced by the weight of \( P \), the whole force applied to elevate the lower block with its attached weight, \( W \), is the weight \( P \) multiplied by the number of strings attached to the lower block; in fig. 4 \( W = 4P \), and in fig. 5 \( W = 6P \); the pulleys in the upper block are being only of use in changing the direction of the pulling force. This system is the one in common use in architecture, in dockyards, and on board ship, and various modifications of it—such as White’s pulley, Smeton’s pulley, &c.—have been introduced; but the simpler forms shown above have been found to answer best. The third system (fig. 6) is merely the first system inverted, and it is a little more powerful, besides having the weight of the pulleys to support the power, instead of acting in opposition to it, as in the former case. The mechanical advantage can be traced out by finding from the form of the combination the ratio between the run of the tackle over the last sheave and the vertical ascent of \( W \), when motion is set up. Theoretically, the larger the number of movable pulleys in any one combination the greater is the mechanical advantage afforded by it; but the enormous friction produced, and the want of perfect flexibility in the ropes, prevent any great increase in the number of pulleys.

Pullman, George Mortimer, the inventor of the well-known ‘cars,’ was born in New York state in 1831, engaged in the business of moving and raising bulk hemp, and in 1859 and 1860 designed and built his first sleeping-car, but in 1863 the first on the model with which his name is now associated (see RAILWAYS). The Pullman Palace-car Company was formed in 1867, under his presidency, and now works nearly 1500 cars. In 1880 he founded an industrial town near Chicago, named Pullman, which has since been absorbed. On the 19th of October 1897 he dropped down dead in the streets of Chicago.

Pulmonaria. See Lungwort.
Pulmonates. See Gasteropoda.
Pulo-Penang. See Penang.
Pulpit. (Lat. pulpitum), an elevated tribune or desk, from which sermons are heard, and other solemn religious addresses are delivered. In great churches the pulpit is commonly placed on the north side of the nave against the wall, or in juxtaposition with a pillar or buttress (see also AMBO). The pulpits of the Low Countries and of Germany are often massive, lofty, and elaborately carved in wood and stone, frequent subjects for ornament being the Conversion of St Paul, the Call of Peter and Andrew, and Adam and Eve (as in the wood-carved pulpit by Verbruggen in St Gallihe at Brussel). Sometimes the canopied or sounding-board is the part most elaborately adorned by carving in wood or stone, as in the pulpit at Fotheringhay, Northamptonshire. Amongst the masterpieces of Nicolo Pisano are the beautifully wrought marble pulpits of the baptistery at Pisa, and of the cathedral at Siena. Some are adorned by bronze-work. The pulpit

(in Arabic, mimeter) forms one of the scanty appliances of Muhammadan worship. See Doolman’s Examples of Ancient Pulpits in England (1849).

Pulque, a favourite beverage of the Mexicans and of the inhabitants of Central America and some parts of South America; made from the fermented juice of different species of Agave (q.v.).

Pulsatilla, or Pasque Flower, a species of Anemone (\( A. \) pulsatilla), of the natural order Ranunculaceae. The species is a perennial herb with doubly pinnate or doubly trifoliate leaves, and a single one-flowered scape. It is narcotic, acid, and poisonous. The pulsatilla is a native of many parts of Europe, and of chalky pastures in several parts of England. It has widely bell-shaped bluish-purple flowers. Other species of Anemone have similar properties, \( A. \) pratensis and \( A. \) petens, the former a native of Europe generally, the latter of Siberia. They all emit, when bruised, a pungent juice, and contain, as their principal constituent, a peculiar pungent essential oil, which, in combination with Anemoniac Acid, forms an acid and very inflammable substance called Anemonic or Pulsatilla Camphor, and is sometimes used in medicine. Pulsatilla is a favourite medicine of the homeopathicists. Easter eggs are coloured purple in some places with the petals of the pasque flower.

Pulse (Lat. pulse), a name for the edible seeds of leguminous plants, as cori is the name for the edible seeds of grasses. Peas and beans are the most common and important of all kinds of pulse; next to them may be ranked kidney-beans, lentils, chick-peas, pigeon-peas, &c. The best kinds of pulse are very nutritious, but not easy of digestion, and are very apt to produce flatulence.

Pulse (Lat. pulsus, ‘a pushing or beating’). The phenomenon known as the arterial pulse or arterial pulsation is due to the distension of the arteries consequent upon the intermittent injection of blood into the arterial trunks, and the subsequent contraction which results from the elasticity of their walls. It is perceptible to the touch in all excepting very minute arteries, and, in exposed positions, is visible to the eye. The pulse is usually examined at the radial artery at the wrist, the advantages of that position being that the artery is very superficial, and that it is easily compressed against the bone. It is usual and convenient, though not quite accurate, to include under the term the conditions observed between the beats, as well as those produced by them.
The condition of the pulse depends mainly on two factors, each of which may vary independently of the other: first, the contraction of the heart, which propels the stream of blood along the artery; and second, the resistance in the small arteries and capillaries, which controls the rate at which it leaves the artery. The first determines the frequency and rhythm of the pulse, the force of the beats; but the tension of the artery between them and their apparent duration depend mainly upon the peripheral resistance. 'Feeling the pulse,' therefore, gives important information besides the rate of the heart's action, and implies more tense or relaxed condition. Dr Broadbent says, 'A complete account of the pulse should specify (1) the frequency—i.e., the number of beats per minute, with a note of any irregularity or intermission or instability of the rhythm; (2) the size of the vessel; (3) the degree of tension of the artery between the beats; (4) the character of the pulsation—whether its access is sudden or gradual, its duration short or long, its subsidence abrupt or slow, note being taken of diastole when present; (5) the force or strength of the beat, and the consistency and pressure within the artery, as measured by its compressibility; (6) the state of the arterial walls.'

The frequency of the pulse varies with age, from 130 to 140 per minute at birth to 70 to 75 in adult males, and with sex, being six or eight beats more in adult females. In some individuals it deviates considerably from this standard, and may even be habitually below forty or above ninety without any signs of disease. It is increased by exertion or excitement, by food or stimulants, diminished in a lying posture or during sleep. In disease (acute hydrocephalus, for example) the pulse may reach 130 or even 200 beats; or, on the other hand (as in apoplexy and in certain organic affections of the heart), it may be as slow as between thirty and twenty.

The normal regular rhythm of the pulse may be interfered with either by the occasional dropping of a beat (intermission), or by variations in the force of successive beats, and in the length of the intervals separating them (irregularity). These varieties often occur in the same person, but they may exist independently. In some individuals the regularity of the pulse is natural to some persons; in others it is the mere result of debility; but it may be caused by the most serious disorders, as by disease of the brain, or by organic disease of the heart.

The other qualities of the pulse are much more difficult to recognise, though of no less importance.

The degree of tension or resistance to compression by the fingers varies greatly: in a soft or 'low-tension' pulse the artery may be almost imperceptible between the beats; in a hard or 'high-tension' pulse it may be almost incompressible. An unduly soft pulse is usually an indication of debility; an unduly hard one is most characteristic of disease of the Kidneys (q.v.) and gout. But the tension, like the frequency of the pulse, undergoes considerable variations within limits from temporary causes, and may in certain individuals be habitually above or below the average without actual disease.

The force of the beats is a measure of the vigour and efficiency of the heart's action. A strong pulse is correctly regarded as a sign of a vigorous state of the system; it may, however, arise from hyper trophy of the left ventricle of the heart, and remain as a persistent symptom even when the general powers are failing. As strength of the pulse usually indicates vigour of the constitution, it is an index of debility. Various expressive adjectives have been attached to special conditions of the pulse, into the consideration of which our space will not permit us to enter. Thus, we read of the jerking pulse, the aching pulse, the hammering pulse, the wiry pulse, the thrilling pulse, the rebounding pulse, &c. The full significance of changes of the pulse in disease can only be appreciated by considering them in connection with the other signs and symptoms of the case. See Medicine (Vol. VII, p.115). Circulation, Heart, Pulsation, and especially The Pulse, by Dr Broadbent (1899).

Pulsometer. See PUMPS.

Pulszky, Francis Aurelius, Hungarian politician and author, was born at Eperjes, 17th September 1814, and after a course of legal studies travelled abroad, publishing (1837) a successful book on England. In 1848 he was appointed to a government post under Esterhazy, but, suspected of sharing in the revolution, fled to London, where he wrote for the papers. When Kossuth came to England Pulszky became his companion, and went with him to America (described in White, Red, and Black, 1852). His wife wrote Memoirs of a Hungarian Lady (London, 1850), and Tales and Travels of Hungary (1851). He was condemned to death by the Austrian government in 1852, but, after living in Italy from 1852 to 1866, was pardoned in 1867. He has sat in the parliament, and been director of museums and libraries throughout the country. His autobiography, in six volumes (1879—82) were translated into German. See F. W. Newman, Reminiscences of Tito Ezeler (1889).

Pultney, William, Earl of Bath. This statesman, descended from a Whig family, was born in 1684, the son of Sir William Pultney, member for Wiltshire (1659—79). He was a student of Christ-Church College, Oxford, where his oratorical power was early displayed. He entered parliament as member for Heydon, Yorkshire, and was a most graceful and brilliant speaker, full of epigram, and a master of all the arts of parliamentary attack. At first, and for many years, the friend and colleague of Walpole, he finally became so disgusted with that minister's indifferrence to his claims that in 1728 he placed himself at the head of a small group of malcontent Whigs, styled the 'Patriots,' and was henceforth Walpole's bitterest and most implacable opponent, being the leader of the coalition against him in the Commons as Carteret was in the House of Lords. He was Bolingbroke's chief assistant in the paper called the Craftsman, which involved him in many civil and legal complications, and speedily made some of his finest pamphlets. In 1731 he wrongly ascribed to Lord Hervey the authorship of a seditious pamphlet; a duel was the consequence, fought with swords in St James's Park, when both combatants were slightly wounded. On the resignation of Walpole in 1741 Pultney was sworn of the Privy-council, and soon afterwards created Earl of Bath; and from that time his popularity was gone. Horace Walpole places him amongst his Royal and Noble Authors, but though his prose was effective as a pamphleteer and his verse graceful, he was probably still better known as the author of a once popular political song, 'The Honest Jury, or Caleb Triumphant,' than by his more serious writings. He died in 1764, a wealthy but disappointed man. See Lecky, History of England, ii. 417 et seq., and Walpole, Letters, of Horley.

Pultowa, or Pol'uta'ya, a town of Russia, situated on a tributary of the Dnieper, by rail 88 miles SW. of Kharkoff and 449 NE. of Odessa. It manufactures tobacco and leather, and has four annual fairs, the most important in July, when cloth, horsehair, leather and hides, and coarse woollen and other stuffs are sold to the amount of £2,500,000 annually. Pop. 43,214. The town is a
PULTUSK, a town of Poland, 32 miles N. of Warsaw. Here Charles XII. of Sweden defeated the Swedes, on 26th December, 1809, was a fierce battle between the Russians and the French, the latter being ultimately victorious. The town was destroyed by fire in 1875. Pop. 16,946.

Pulvermacher's Chains. See Electricity (Mechical).

Puma, or Couguar (Felis concolor), a large Cat distributed in North and South America between 60° N. and 50° S. lat., but rare in these parts which have been long settled. It is sometimes called the American 'lion,' 'panther,' ('pantier'), or 'catamount,' and is about the size of a leopard. The Fur is thick and close, dark yellowish red above, lighter on the sides, and reddish white on the belly; the muzzle, chin, throat, breast, and inside of the legs are more or less white. But the colouring varies a little in different localities. Young pumas have dark brown spots in three rows on the back, and scattered markings elsewhere. The long tail is covered with thick fur, and is slightly coiled. The pumas have very diverse haunts—the forest, the bush, and the grassy pampas; they have no fixed lairs, but roam about by night from place to place in search of prey. They are agile in their movements, and can leap and spring well, but swim only under compulsion. Many kinds of mammals fall victims to the pumas, and they are the more disastrous to flocks and herds because of their habit of killing many more than they devour. To thebooty which they have secured but merely tasted they will afterwards return. They rarely attack man, but one puma has been known to kill fifty sheep in a night, drinking a little of the blood of each; hence their extermination in many regions. The two sexes live apart, but pair in winter and return to the woods. Some young are born at once, and are left a good deal to themselves, though after the first birth the mothers are certain affectionately. In spite of its restless and voracious instincts the puma may be readily tamed, and is said to become gentle. The skin is sometimes used for the occasional extirpation.

Pumice, a general term for the cellular, spongiform, filamentous, or froth-like parts of lavas. This highly porous and froth-like structure is due to the abundant escape of vapours through the rock while it was in a state of fusion. Under the microscope the rock is seen to be a glass, crowded with minute gas or vapour cavities and abundant crystallites. Owing to its porous structure pumice readily floats in water. It is usually a form of some highly acidic lava, such as obsidian; but now and again basic lavas give rise to pumice (Canyon Island, Hawaii). The latter is dark brown or black, and only abundantly frothy; the former, which is much the more common, is white or gray, and sometimes yellow. It is a hard but brittle rock, and is much used for polishing wood, ivory, metals, glass, slates, marble, lithographic stones, &c., in preparing vellum and parchment, and for lifting new cars and calceolarias. Great quantities are exported from the Lijari Isles; and that from the quarries in the Peak of Teneriffe, 2000 feet above sea-level, is better and cheaper. Pumice occurs as the crust of some kinds of lava, and in the form of clouds or shelves during volcanic eruptions. Sometimes immense quantities are thrown into the sea and are often floated for great distances. Eventually the cinders get water-logged and sink to the bottom. Abundant fragments were dredged up from abyssal depths by the Challenger expedition. After the eruption and earthquake in the Straits of Sunda in 1883, the seaport of Folok Batoing was closed with a barrier of pumice 19 miles long, two-thirds of a mile broad, and from 13 to 16 feet deep.

Pumpenickel, a kind of rye-bread (made of unbolted flour), much used in Westphalia. The etymology is disputed.

Pumpkin. See Gourd.

Pumps, machines for lifting liquids to a higher level, include (1) the Lift or Suction Pump, (2) the Lift and Force Pump, (3) the Pneumator, (4) the Chain-pump, (5) the Spiral Pump, (6) the Centrifugal Pump, (7) the Jet-pump, (8) the Persian Wheel, (9) Scoop-wheels.

(1) The Lift or Suction Pump (fig. 1).—A is the cylinder (the 'barrel'), closed or open at the top; B is a pipe (the 'suction-pipe') communicating with the water to be raised; C is a 'discharge-pipe,' which may be reduced to a mere spout; D is a valve, opening upwards only; E is another valve, also opening upwards only, and borne by F; G is the 'bucket,' a hollow cylindrical piece of wood or metal which is made, by leather or by hemp or other packing, to fit the barrel just so closely that it cannot travel between the bucket and the barrel; G is the piston-rod, driven by hand, steam, windmill, or animal power, and moving the bucket upwards and downwards in the barrel. Each upward stroke of the piston at first lifts air, of which none can travel back past the bucket; as the partial vacuum is produced in B, water ascends in B until the external atmospheric pressure is balanced by the partial atmospheric pressure below G. The force of a weight of the water column in B, as F now descends, air gets to the upper side of the valve, and is lifted on the upstroke, and so on: so that, if the valve D be not more than at most 33 feet above the water below (in practice 25 feet or less), water will be, step by step, pushed up B by the external atmospheric pressure until the valve D is under water; thereafter the succeeding strokes of the pump operate on the water above D and force it up the discharge-pipe, C, the external atmospheric pressure keeping the space below D filled with water. The power expended is applied (1) in lifting water; (2) in overcoming the pump-friction; (3) in overcoming the water-friction; and, (4) where the pump is ill-shaped, in producing eddies and broken water. A lift-pump must be very carefully proportioned and constructed in order to utilise, in water-lifting, one-half of the whole power expended in working it. Such pumps must work slowly, so that the valves may close properly; and an air-vessel is, if C be not a more powerful spout, required to minimise shock and render the outflow less intermittent, by the compression and elastic expansion of the air contained in it. The outflow is also regulated by driving two or three pumps off the same shaft and properly timing their relative motions.
(2) **The Lift and Force Pump** (fig. 2).—The piston is solid, and the valve $E$, instead of being carried by the piston, is fitted in the discharge-pipe. During the downward motion of the piston water is forced past the valve $E$; it cannot return; and water may thus be forced to considerable heights. Sometimes (fig. 3) the piston is made to fit, not the barrel, but the stuffing-box, $B$, which can be tightened down on it so as to make the fit good. An air-vessel, or a loaded hydraulic press called an 'accumulator,' is fitted on the discharge-pipe so as to minimise shock and intermitence; and double pumps are very generally employed, directly driven by steam-engine pistons or driven by a flywheel. Force-pumps are used for deep wells and mines, hydraulic presses, boiler feeds, cressoting timber, hydraulic lifts, steam fire-engines both land and marine, and hydraulic power supply.

(3) **The Pulcrometer.**—Two chambers, $A$ and $B$, converge above and communicate with a single steam-pipe; a ball-valve shuts off either $A$ or $B$, but not both at the same time, from the steam. $A$ and $B$ have a discharge outlet and a suction inlet, both these having valves. The whole is filled with water; the steam drives water from, say, $A$, into the discharge-pipe; condensation takes place and the ball-valve is pulled over, so as to shut off the steam from $A$; the steam then acts in $B$ in the same way as it had done in $A$, while in the meantime $A$, where there is a partial vacuum, is being filled with water from the suction-pipe. The two chambers thus act alternately. The whole contrivance can be hung by chains and let down to the required position; and it is greatly in use in contractors' work.

(4) **The Chain-pump.**—This pump is formed of plates called lifts or buckets, fastened, now generally, by their centres, to an endless chain and moving upwards, in a case or 'barrel' which is in places constricted so as just to let the buckets pass. Chain-pumps are noisy and somewhat apt to break down; but they can lift very gritty or muddy material. Dredging-machines (q.v.) with their buckets are a variety of this device.

(5) **Spiral Pumps.**—An Archimedes' Screw (q.v.) is rotated round its axis so as to make water slip up the inclined plane of the screw. They are very economical in power, and they work so regularly that they act as meters.

(6) **Centrifugal Pumps** (figs. 4 and 5).—The water enters by the supply-pipes, $A$, $A$, which lead to the central orifices of the fan, $B$, $B$; it then traverses the passages, $C$, $C$, formed by the vanes and the side covering-plates, $D$, of the fan. The fan is made to rotate from the shaft, $E$. The water acquires a rotatory motion while passing through the passages of the rotating fan; it then enters the whirlpool-chamber, $F$, and is discharged by the pipe, $G$, at the circumference of $F$; and the velocity of rotation of the fan determines the height to which the water will rise in the discharge-pipe. This velocity cannot conveniently be made to exceed a certain limit; hence the utility of centrifugal pumps is practically limited to low lifts; but as they can be made very large they can deal with enormous quantities of water; and they are much used for pumping in docks, canals, marsh and polder draining, land-reclaiming, and the like. As they have no valves they are little liable to become choked. In nearly all modern centrifugal pumps the whirlpool-chamber, $F$, the purpose of which was to reduce the ultimate velocity of onflow and correspondingly to increase the pressure, is dispensed with; and the same end is attained without wasting energy through friction in the vortex, $F$, by shaping the vanes of the fan so as to reduce the velocity. See Cotterill's Applied Mechanics.

(7) **The Jet-pump,** now not much used, is practically a Giffard's Injector (q.v.) worked by water from a height instead of by steam.

(8) **The Persian Wheel.**—An under-shot wheel (mill-wheel in which the water flows under the wheel) in which little buckets are carried by the rim of the wheel so as to pick up water from the stream and deliver it at the top of the wheel.

(9) **Scoop-wheels or slash wheels,* equivalent to breast water-wheels with reversed action; driven by windmills or by steam, they raise water in their buckets and deliver it a few feet higher up; in some cases they have curved blades, and the water is delivered at the centre of the wheel.

See **Pumps and Pumping Machinery,** by Frederick Colyer, C.E. (Lond. 1886); also see Aire-pump.
Pun, the name given to a play upon words that agree or resemble each other in sound but differ in sense, a verbal quibble by means of which an incongruous and therefore ludicrous idea is unexpectedly shot into the ear, as in the answer to the grave question, 'Is life worth living? '-'That depends on the liver.' We find this form of wit in Aristophanes and Cicero, and in old England it was not unknown even in the pulpit. The sermons of Bishop Andrews and the Church History of Bishop Howard were marked by examples of Thomas Fuller abundant in puns of all degrees of goodness and badness; they meet us strangely enough even in the gravest situations in the tragedies of Shakespeare, and there is at least one in Lidell and Scott's Greek Lexicon. Dr. Johnson said that the man who would make a pun would pick a pocket; but this sentence bears too hard upon the best beloved of English writers, Charles Lamb, a hardened punster, not to speak of Sydney Smith, Hook, Hook, the prince of punsters, and Bishop Wilberforce. Boswell, while relating Dr. Johnson's dislike to puns, ventures his own opinion that 'one or two may be admitted among the smaller excellencies of conversation.' But a pun of the best kind has a value infinitely higher than this: there is tenderness as well as wit in Fuller's phrase of the Holy Innocents of Bethlem—'the infancy in the noble army of martyrs.'

See Spectator, No. 61, L. Larcey's Les Joueurs des Mots (1886), and Holmes' Autocrat of the Breakfast Table. The Hon. Hugh Rowley's Puniana (1887) contains many hundreds examples, among them a few good puns.

**Punch**, a beverage introduced into England from India, and so called from being usually made of five (Hindi, punch) ingredients—arrack, tea, sugar, water, and lemon-juice. As now prepared, punch is a drink the basis of which is alcohol of one or more kinds (especially rum), diluted with water, flavoured with lemon or lime-juice and spices, and sweetened with sugar; sometimes other ingredients are added according to taste, especially wine, ale, and tea. 'Rack-punch' takes its name from the rack of punch, the old-fashioned beforehand (of rum and brandy with milk), bottled, and served cold—even iced. Whisky-toddy, made with whisky, hot water, and sugar, is a kind of punch, the name toddy being Hindustani.

**Punch**, with his wife Judy and dog Toby, the chief characters in a popular comic puppet-show, of Holbeineian lineage, is a caricature of Punchinello, for Pulcinello, the clown of Neapolitan comedy. The word is a diminutive from pulcino, 'a young chicken.' The identification with Pontius Pilate, as well as of Judy with the betrayer Judas, is entirely without foundation. Many believe the modern Punch to have originated in a survival of the Maccus, the fool or clown of the ancient Attellian (q.v.), just as the Italian Arlecchino and Brighetta are of their other Oscar characters. But the line of descent is certainly obscure enough, and it is at least not improbable that some trace of the old Ludii Orci, transmitted through the Vice of the mystery plays, may lurk in the modern drama of the hook-nosed luncheonblack punch and his unfortunate wife Judy. The full-grown modern dramas, which can scarcely be looked on as a school of the domestic virtues, is ascribed to an Italian comedian of the name of Silvio Foscarini, about 1590. The exhibition soon found its way into other countries, and was very popular in England during the 17th century. Its popularity seems to have reached its height at the time of Queen Anne, and continued so for many years. See spectator a regular critic of one of the performances. In 1812 Ouseley saw at Tabriz in Persia a Gypsy puppet-show very like our Punch and Judy. See also MARIONETTES.

The performance of Punch, as generally represented, requires the assistance of only two persons—one to carry the theatre and work the figures, the other to bear the box of puppets, blow the trumpet, and sometimes keep up the dialogue with the figures. The characters of the puppets are managed simply by putting the head, hand, and under the dress, making the second finger and thumb serve for the arms, while the forefinger may be used for the head.

**Punch**, or the **LONDON CHARIVARI**, the English comic journal par excellence, is a weekly magazine of wit, humour, and satire in prose and verse, occasionally adorned by sketches, caricatures, and emblematical devices. It draws its materials as freely from the most exalted spheres of foreign politics as from the provincial nursery; and, dealing with every side of life, is not less observant of the follies of Belgaria than of the peculiarities of Whitechapel. Punch gives dancers place to Irish bulls and dry Scotch humour, and does his best to present them in the raciest vermicul. Stern in the exposure of sham and vice, Punch is yet kindly when it makes merry over innocent follies. Usually a censor omnium in the guise of Joe Miller, a genial English Don Quixote who hurry up the convicts, and, when they are hanged, Punch at times weeps with them. Had he not, and, jocos remotis, pays a poetical tribute to the memory of the departed great. The wit and spirit of serial prints was founded in 1841, the first number appearing on the 17th July of that year, and, under the joint editorship of Henry Mayhew and Mark Lemon, soon became a household word, while ere long its satirical cuts and witty rhymes were admitted a power in the land. **Punch** is recognised as an English institution, and in corners of Europe and America an Englishman rarely comes the frequenter of the café may be asked whether the esoteric wit and wisdom of Cockayne. Their contributions to Punch helped to make Douglas Jerrold, Gilbert à Beckett, Tom Hood, Albert Smith, Thackeray, Shirley Brooks, Tom Taylor, and F. C. Burnand famous; as their illustrations did H. K. Browne, D. G. Doyne, Tenniel, John M. S. Maurier, Keene, L. Sambourne, and Furniss. It should be noted that this comic genial paper has done memorable service in purifying the moral standard of current wit in England.

See CHARIVARI, CARICATURE, the articles on the chief contributors to Punch, for a forum of opinion, by Athel Mayhew, rather unduly magnifying Mayhew's power, and The History of Punch, by M. H. Spielmann (1895).

**Punchestown.** a racecourse close to Naas, 20 miles SW. of Dublin, where are held in April the steepleschases of the Kildare Hunt. There are stone monuments near.

**Punctuation** is the art of marking the divisions of a sentence by means of conventional signs — the full stop or period (.), the semicolon (;), the colon (:) the comma (,), the dash (—), mark of exclamation (!), mark of interrogation (?), inverted commas (" "), and brackets ( [ ] ). Broadly speaking, there are two principal systems of punctuation, the grammatical and the legographical. The system most frequently followed in British printing-houses is neither of these, being a set of empirical rules, in which the logical element is almost entirely wanting, the grammatical is present to some extent, but the ruling factor is apparently arbitrary fancy. Commas are too often held in profound contempt, being scattered at random amongst the words as if from a pepper-box. These lawless little adjuncts can be found, in the best-printed books, insinuating themselves between subject and verb in even short sentences. The printing-offices of the United States are to some extent uniform in their practice. The system they follow is much better than those in
PUNJAB

Britain, and is based principally upon grammatical laws. The old-fashioned method of putting in a comma (or break) or change in the grammar would naturally pause to take breath when reading aloud (as at this point of this sentence) has little in reason to commend it. Punctuation is confessedly difficult, partly owing to the vast differences in the style of different writers, and partly owing to the sentence, but not to the grammar. Punctuation, like grammar, is an irregular word-arrangement which in some cases is inevitable. Given a sensible system, practical experience is the best teacher. In theory little more can be done than to lay down a few general maxims for guidance.

In the first place, follow a logical method of sentence subdivision: let the first and foremost aim be to bring out the meaning clearly and unambiguously, in so far as this can be done with the help of stops. Use commas and semicolons sparingly, especially between them; indeed, only where they are absolutely necessary. The sentence should stand on its own feet, not rest upon a long array of comma crutches. It is not as a general rule necessary to set commas to fence or adorn every adverbial clause. Special care is required in conjunction clauses that may have relativistic clauses. If the relative sentence is entirely subordinate to the main sentence, or if it gives additional information, separate it by a comma or commas; if on the other hand it belongs essentially to the structure of the thought expressed by the main sentence, put no comma. For example, in "that man who had an impediment in his speech," written without the comma, the relative clause points out this particular man and distinguishes him from some other or others who have been also spoken of: it follows in fact the form of the article of demonstrative pronoun. In the same sentence printed with the comma, "the man, who had &c., the relative clause gives an entirely new piece of information, and is no longer demonstrative. The colon is generally put before a long quotation. It would be well to confine the use of it and to one other case—namely, to part a general statement from the immediately following particular application of it or exemplification of it in detail. As for dashes, it is difficult to summarise the rules for their use. They are commonly employed to indicate a sudden break or change in the structure of the logical development of the sentence, as well as to put ironical emphasis upon a word or words thrown to the end of the sentence, as in Heine's phrase, 'Göttingen is noted for its probable home,' suggestions of a tentative nature, or, as in Robert Southey's "The Cottagers," "Nor in the country, nor in the town, nor in the world." The mark of this trogue is generally better without such a clumsy advertisement of the humour. A dash may precede an enumeration of mere names or dates or objects expressed in very brief terms. One dash may also be put before and one after a short clause that merely explains in other words or makes clearer a statement that has just been made: both dashes, and not one dash and some other stop, should be used, except where the second would fall at the end of a sentence. But for this purpose, especially where the parenthetical nature of the added explanatory clause is more pronounced, we are more frequently employed. Semicolons are most appropriately used in compound sentences or sentences that embrace antithetical statements. In the former case of sentence they should mark off the subordinate sentences from the main sentence, and from one another; in the latter case they should separate the antithetical sentences, which generally begin with 'but' or some equivalent. The mark of exclamation has another besides its legitimate use: it is frequently put after absurd or highly improbable statements. The mark of interrogation too has a secondary use: placed in brackets immediately after a word it throws doubt upon its correctness, either as according with fact or as being philosophically to be desired. It is, however, impossible to lay down any general rule. Of course these are only general rules. Many exceptions even to them must necessarily occur. The golden rules in all cases of doubt are two: (1) let logic or, better, common sense be the supreme guide; (2) punctuate so as to bring out the sense best. It is always best for the beginner that British printing-houses would come to some agreement as to a uniform and systematic method of punctuation. See H. Beadnell's Spelling and Punctuation (4th ed. 1891).

Pundit (Hindi, pandit; Skt. pandita, a learned man), in India, a teacher, especially a Brahman, or a Sanskrit scholar. The chief images of India, law, and religion. Of late native pundits have done good service as geographical explorers in districts, such as Tibet, not accessible to Europeans.

Punjab, a river of Portuguese East Africa, forming the principal waterway of Mabonal and Mashonaland; its mouth is situated some 23 miles NE. of Sofala and 130 SW. of the Zambezi delta. After some diplomatic difficulties between Britain and Portugal, it was agreed (1891) by Portugal that British commerce should have unimpeded access by rail or by boat to the interior; under this arrangement, the Pungwe was being made freely navigable for British vessels. In 1894 nearly 200 miles of the railway to the interior had been laid. See Beira.

Punic Wars. See Carthage.

Punishment will be found described in the articles in this work on Criminal Law, Imprisonment, Prisons (p. 429), Flogging, Execution, Pillory, &c. See also the description of Tortures, Book, Guillotine, Thumb-screw, Branks, Jourgs, Ducking-stool, Stocks, &c.; the articles on the several crimes; and W. Andrews, Old-time Punishments (1891). The question of future punishment is treated in the article HELL.

Punjab, or Panjab (pāndj-āb, 'five rivers,' the Pentapontion of the Greeks), a separate province of India, occupying the north-west corner, is watered by the Indus and its five great affluentsthe Jhelum, Chenab, Ravi, Beas, and Sutlej. It is bounded on the W. by Afghanistan, on the N. by Cashmere, on the S. by Sind, and on the E. by the North-western Provinces, and on the S. by Rajputana and Sind. The area under direct British administration is 106,632 sq. m.; that of the native states, thirty-four in number, under British suzerainty (1891) 18,457 in British province and 3,861,883 in the independent states; (1891) 20,803,000 in British territory and 4,256,670 in the feudatory states. The capital is Lahore, but both Delhi (formerly in North-western Provinces) and Amritsar (the religious capital of the Sikhs) are larger. The whole of the northern parts are traversed by spurs from the Himalayas, which enclose deep valleys. On the west the Salt Range mountains run parallel to the Indus. In the south the surface is not broken by any important eminence, except the Salt Range, varying from 2000 to 3000 feet high, between the Indus and the Jhelum. The country, divided into six doabs, or interfluvial tracts, and frequently spoken of as the plains of the Indus, has a general slope towards the south-west. The climate in the plains is mild and dry in summer, reaching in May 87°-4 to 116°-6 F. in the shade at several stations; but is cool, and sometimes frosty, in winter. Little rain falls except in the districts along the base of the Himalayas. The soil varies from stiff clay and loam to sand; but, in general, is sandy and barren, intermixed with fertile spots. Rivers and canals afford ample means of irrigation.
The indigenous vegetation is meagre. Trees are few in number and small, and fuel is so scarce that cow-dung is much used in its stead. Wheat of excellent quality is produced in considerable quantities, as Amritsar, Lahore, Multan, &c. Punjaub exports indigo, grain, salt, metals, spices, tea, tobacco, manufactured cottons, hides, and leather to Kabul, Cashmere, Turkestan, and Tibet; and imports dyes, goats' wool, raw silk, fruits, ghee, horses, fur, timber, and shawl cloth. The total value of the trade is £2,999,000. The inhabitants are of various races, chiefly Sikhs, Jats, Rajputs, and Pathans. Of the whole population, nearly 56 per cent. are Mohammedans; Hindus constitute nearly 38 per cent.; and Sikhs 6 per cent. The Jats are the most prominent race, and are said to have formed the 'core and nucleus' of the Sikh nation and military force. For the history of the Punjab, see Sikhs.

Punkah, a gigantic fan for ventilating apartments, used in India and tropical climates. It consists of a light frame of wood, covered with calico, from which a short curtain depends, and is suspended from the ceiling; another rope from it passes over a pulley in the wall to a servant stationed without; the servant pulls the punkah backwards and forwards, maintaining a constant current of air in the chamber.

Punjo. See PERU, pp. 79-80.

Punt, a heavy, oblong, flat-bottomed boat, used in the Nile where stability and not speed is needed. Punts are also used for fishing and wild-fowling. Some are fitted for oars; but the more usual mode of propulsion is by poles operating on the bottom.

Punta Arenas, (1) the chief port of Costa Rica on the Pacific, stands on a 'sandy point' jutting into the Gulf of Nicoya, and is connected by railway with Esparza, 14 miles east-north-east. The city has a coffee market, and after that indiarubber, hides, dye-woods, and tobacco. Pop. 8000. — (2) A town in Patagonia (q.v.).

Pupa (Lat., 'a doll'), the stage which intervenes between the larva and the adult in the life of insects with complete metamorphosis. Chrysalis, aurocles, nymphs are almost synonymous terms, but pupa is more general and is sometimes applied to stages of the incomplete metamorphosis of other animals besides Insects (q.v.).

Pupil. See INFANT, and EYE, Vol. IV. p. 507; for Pupil-teachers, see EDUCATION.

Puppet. See Marionettes.

Purana (Sansk., 'old') is the name of that class of religious works which, besides the Tantras (q.v.), is the main foundation of the actual popular creed of the Brahmans Hindus (see INDIA, Vol. VI. p. 166). According to the popular belief, these works were compiled by Vyasa, the supposed arranger of the Vedas (q.v.), and the author of the Mahābhārata (q.v.), and possess an antiquity far beyond the reach of historical computation. A critical investigation, however, of the contents of these ancient works bearing that name must necessarily lead to the conclusion that in form they not only do not belong to a remote age, but can barely claim an antiquity of a thousand years, though they contain materials much more ancient. Cosmogonic and theologian doctrines, epic stories, legendary lore, and miscellaneous and encyclopedic matter constitute their contents. They all recognise the Hindu trinity, but are of sectarian tendency; the claims of one god or one holy place being in the various books or parts of them insisted on as worthy of special, if not exclusive, reverence. The Purānas are usually said to be eighteen in number (with a subordinate Upanisadic Purāna which is often classed with each); and they are divided into three groups of six. The first two are devoted to Vishnu and to Siva; the third, which should have fallen to Brahma, is mainly devoted to the several forms of Vishnu, Krishna, Deva, Ganasa, and Surya. They are written in epic couplets, and the eighteen chief Purānas are calculated to contain 400,000 couplets.

See VISHNU, SANSEERIT LITERATURE; Dr John Muir's Samarcid Texts (1858-71); the Vishnu Purana trans. by H. H. Wilson (1849; 2d ed. by Fitzwardell Hall, 1894-97); the Indiscript and Divine, by Dr Burnouf and Hauvette-Bessault (4 vols. Paris, 1840-84), and, with a Sanskrit commentary, by Shriddhar Pandit (3 vols. Bombay, 1887); the Markandeys and Agni Puranas, in the Bibliotheca Indica, by Bazarin and Rajendralal Mitra.

Purbeck, Isle of, a peninsular district of Dorsetshire, 12 miles long and 5 to 9 broad, is bounded N. by the river Frome and Poole Harbour, E. and S. by the English Channel, and W. by the Isle of Purbeck, which is connected with the mainland by the bridge of Lackford Lake, which runs from Lulworth Park to the Frome. The coast is bold and precipitous, with St. Albans Head, 360 feet high; inland a range of chalk downs curves east and west, attaining a maximum height of 655 feet. The geology of the 'isle' is very interesting. The Purbeck Beds are a group of strata forming the upper members of the Jurassic System (q.v.); the Purbeck Marble, belonging to the upper section of these, is an impure fresh-water limestone, composed wholly of the shells of Paludina cavernosa (see DIORITE-BEDS). Nearly a hundred varieties are known, and the largest is a curious kind of trades' guild. Of old the 'isle' was a royal deer-forest. Swanage and Corfe Castle are the chief places.

See Robinson's A Royal Warren, or Rambles in the Isle of Purbeck (1862), and J. Bray's Swannage (1890).

Purcell, Henry, the most eminent of English musicians, was born at Westminster in 1658, and was son of William and Anne Purcell, who was organist of the Chapel Royal appointed at the Restoration. He lost his father at the age of six, and was indentured for his musical training to Cooke, Humfrey, and Dr Blow. His compositions at a very early age gave evidence of talent. In 1680 he was chosen to succeed Dr Christopher Gibbons as organist of Westminster Abbey; and in 1682 he was made organist of the Chapel Royal. He wrote numerous anthems and other compositions for the church, which were eagerly sought after for the use of the various cathedrals, and have retained their place to the present day. Purcell's dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his opera Diado and Aeneas, written at the age of seventeen, his music to the Tempest, his songs in Dryden's King Arthur, his music to Howard's and Dryden's Indian Queen, to D'Urfeys Don Quixote, &c. A great many of his cantatas, odes, glee, catches, and rondos are yet familiar to lovers of vocal music. In 1683 he composed twelve sonatas for two violins and a bass. Purcell studied the Italian masters deeply, and often made reference to his obligations to them. An originality and vigor in the expression of harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His style foreshadows that of Handel. His church music was collected and edited from the original MSS. by Vincent Novello, in a folio work which appeared in 1869, as well as rich and abundant in his life and works. A complete edition of his
works, many of which are still in MS., was undertaken by the Purcell Society, instituted in 1876. He was buried in Westminster Abbey in 1695, and was

Purchas, Samuel, was born at Thaxted in Essex in 1577, and educated at St John's College, Cambridge. He was presented by the king in 1604 to the vicarage of Eastwood, which he soon resigned to his brother, as the chosen labour of his life resided in the City of London. Later he became rector of St Martin's, Ludgate, and chaplain to Archbishop Abbot, and died in September 1626, if not in a debtor's cell, yet in difficulties. His great works were Purchas His Pilgrimage; or, Relations of the World and the Religions observed in all ages (4 vols. folio, 1610); and, Galatians, and Ephesians Posthumous, or Purchas his Pilgrimes: containing a History of the World, in Sea Voyages and Land Travels by Englishmen and others (4 vols. folio, 1632). The fourth edition of the former usually accompanies the latter as if a fifth volume, although a quite different book is often referred to in other works as "the Purchas". This book holds much resemblance in name, nature, and feature, yet differ in both the object and the subject. This (the Pilgrimage) being mine own in matter, though borrowed in form and method; whereas my Pilgrimes are the acts of others, acting their own parts in their own words, only furnished by me with such necessaries as that stage further required, and ordered according to my rules. Another work is Purchas his Pilgrimes: Micromegas, or the History of Man; relating the wonders of his Generation, varieties in his Degeneration, and necessity of his Regeneration (1619).

Purification. See ORDEAL.

Purgativeness. See APERIENTS, CONSTITUTION.

Purgatory (Lat. purgatorium, from purgo, 'I cleanse') is the name given to a place of purgation, in which, according to the Roman Catholic and Orthodox Churches, after death either are puri- fied from venial sins (pecuta venalitatis) or undergo the temporal punishment which, after the guilt of mortal sin (pecuta mortalitatis) has been remitted, still remains to be endured by the sinner (see ABNOMENT). The ultimate eternal happiness of the saints and just men is to be secured, to the belief obtained for a time in a state of purgation, in order to be fitted to appear in that Presence into which nothing imperfect can enter. Catholics hold as articles of their faith (1) that there is a purgatory in the sense explained above, and (2) that the souls there detained are under the disposition and action of the faithful and from the sacrifices of the mass. The scriptural grounds alleged by them in support of this view are 2 Macc. xii. 43-46, Matt. xii. 32, Luke, xii. 48, 1 Cor. iii. 11-15, 1 Cor. xv. 25; as well as certain less decisive indications contained in the language of some of the Psalms. And in all these passages they argue not alone from the words themselves, but from the interpretation of them by the Fathers. The direct testimonies cited by Catholic writers from the Fathers are very numerous; the chief amongst them, however, are the letters of St Paul to the Romans and to the Ephesians, written to the laity, among which the Latins Augustine being one of the most important (though at times he speaks doubtfully); in Gregory the Great the doctrine is found in all the fulness of its modern detail. The epi- taphs of the catecombs, too, supply Catholic contrac- tualists with some testimony to the belief of a purgatory, and of the value of the intercessory prayers of the living in obtaining not merely repose, but relief from suffering, for the deceased; and the liturgies of the various rites are still more decisive arguments in this direction. Beyond these two points Catholic faith, as defined by the Council of Trent, does not go; and the council expressly prohibits the popular discussion of the 'more difficult and subtle questions, and everything that tends to curiosity, or superstition, or savours of filthy lucre.' As to the substance of the doctrine, purgatory and Greek and Latin churches are agreed; and they are further agreed that it is a place of suffering; but, while the Latins commonly hold that this suffering is 'by fire,' the Greeks do not determine the manner of the suffering, but are content to regard it as that which is due to the unfruitful works of their ultimate salvation; and whether a particular judgment is passed on every one immediately after death. For Patrick's Purgatory, see DEGO (LOUGH). The medieval doctrine and practice regarding purgatory may be divided into the periods of the early and the later Middle Ages. After the sixteenth century, the protest of the Waldenses and other sects of that age. The Reformers as a body rejected the doctrine. Protestants generally refer to the arguments of Roman Catholics on the subject of purgatory by refusing to admit the authority of tradition or the testimonies of the Fathers, and at the same time by alleging that most of the passages quoted from the Fathers, as in favour of purgatory, are insufficient to prove that they held any such doctrine as that now held by the Roman Catholic Church. Some of them, however, relating only to the subject of prayer for the dead (see PRAYER), and others to the doctrine of Limbus (q.v.). That the doctrine of purgatory is the fair development of that which maintains that prayer ought to be made for the dead; Protestants gener- ally acknowledge. As to the alleged evidences from Scripture, they are commonly set aside by Protestants as irrelevant or wholly insufficient to support such an inference. The doctrine of purgatory in its historical connection with other ecclesial- logical doctrines is touched on in the article HELL.

Purification of the Blessed Virgin Mary, Feast of, a festival in commemoration of the 'purification' of the Blessed Virgin Mary, in accordance with the ceremonial law of Lev. xii. 2. This ceremony was appointed for the fortieth day after childbirth, which, reckoning from December 25 (the anniversary of a certain nativity in the year upon which the Purification of the Blessed Virgin Mary was celebrated). The history of Mary's compliance with the law is related in Luke, ii. 22-24. The date of the introduction of this festival is un- certain. The first trace of it is about the middle of the 5th century, and in the Church of Jerusalem. In the Western Church it was known to Beza. Its introduction in the Roman Church in 494 was made by Pope Gelasius on the occasion of transferring to a Christian use the festivities which at that season were among the leading phases of the Lupercalia. See CHURCHING OF WOMEN.

Purim, a Jewish secular rather than religious feast, in honour of the deliverance of the nation, recorded in the Book of Esther, held on 14th to 15th Adar. Apparently it spread but slowly; still Josephus tells us that by his time it was observed over all the Jewish world. Most modern scholars
Puritans, a name first given, according to Fuller, to a body of churchmen in England who in 1612 were opposed to those clergymen of the Church of England who refused to conform to its liturgy, ceremonies, and discipline as arranged by Archbishop Parker and his coadjutors. The history of Puritanism within the church is sketched at England (Church of), Vol. IV. p. 512. In the church, repressive measures, the principles of the party amongst the clergy who believed that the church did not separate itself markedly enough from Roman Catholicism and needed further reformation gradually spread among the serious portion of the laity, who were also called Puritans. But the name appears not to have been confined to those who wished for certain radical changes in the forms of the church. The character that generally accompanied this wish led naturally enough to a wider use of the term; hence, according to Sylvestre, 'the obvious mutine of the bulky body called all Puritans that were strict and serious in a holy life they were ever so conformable.' This is the sense in which the Elizabethan dramatists use the word From this very breadth of usage one sees that there was really no fixed idea of Puritanism. Some would have been content with a moderate reform in the rites, discipline, and liturgy of the church; others (like Cartwright of Cambridge) wished to abolish Episcopacy altogether, and to substitute Presbyterianism; while a third party, the Brownists or Independents, were out-and-out dissenters, opposed alike to Presbyterianism and Episcopacy During the reigns of James I. and Charles I. the spirit of Puritanism continued more and more to flourish in the English church and society, and the English Parliament, although the most violent efforts were made by both monarchs to check it, never succeeded in putting down the spirit of the churchmen of the Synod of Dort (1618-19) both the Puritans and their opponents in the church had been substantially Calvinist; the strong tendency towards Arminianism amongst churchmen raised a new ground of controversy between the Puritans and the more extreme party of the Lord Treasurer of the Netherlands and the Catholics. The policy of Land and the outrages practised by Charles I in the English constitution led many who were not all Genevan in their ideas to oppose both church and king for the sake of the national liberties. In the member of Westminster, Assembly of Divines (1643) the great majority of the ministers were Presbyterians. But the more advanced Puritans, who were predominant in the army and the parliament, ultimately triumphed in the person of Cromwell (q. v.). The Restoration (1660) brought back Episcopacy, and the Act of Uniformity (1662) threw the Puritans of the church into the position of dissenters Their subsequent history is treated under the different forms of dissent. Before the Civil War broke out so great were the hardships to which the Puritans were exposed that many of them emigrated to America, to seek liberty and peace on the solitary shores of the New World. There they became the founders of the New England states, and cultivated unmolested that form of Christianity to which they were attached. Notwithstanding the spirit of Puritanism in its evil as well as its good, they were thoroughly American in spirit than in Massachusetts. In Scotland Puritanism dates rather from the 'Second Reformation' of 1638 than from the original establishment of Presbyterianism after the Reformation.

See Neil's History of the Puritans (ed. by Tomlin, 5 vols. 1822); the histories by Stowell (1814); new ed. 1878) and Marsden (1850); Bacon, The Genesis of the New England Churches (New York, 1874); Ellis, Puritan Age in Massachusetts (Boston, 1883); the works cited at S. R. Gardner, with his Constitutional Documents of Puritan Revolution (1890); the articles in this work on Interdependent Church, Presby- terianism, Westminster Assembly, Putten, Mar- prelate, Hampton Court, Smectymnuus; on Eliza- beth, James I., Charles L, Cromwell, Milton; on Land, Puritans, Reformation, Menander, on Puritans How, Baxter, Owen. In Nield's edition of the Puritan divines (20 vols. 1861 et seq.) other names included are those of Manton, Adams, Goodwin, and Jackson.

Purkinje's Figure, named after the physiologist J. F. Purkinje (1797-1869), a professor at Breslau and at Prague; see EYE, Vol. IV. p. 512.
Purl, a beverage made by warming a pint of ale with a quarter of a pint of milk, and adding sugar and a wine-glassful of gin, rum, or brandy.
Purley. See Tooke (Horncp).
Purmencrd, a town of North Holland, 10 miles N. of Amsterdam; pop. 4980.
Purunth, a town of British India, in the presi- dency of Bengal, 230 miles N.W. of Calcutta, has a trade in jute. Pop. 16,500.

Purple Colours. Painters in oil and water colours prepare various shades of purple by mixing certain red and blue pigments, or by taking an oil French ultramarine, often called French blue, is mixed with vermilion or some madder red (madder carmine is best), or one of these reds with cobalt blue if a pale purple is wanted. For permanent purples in water colours the same blues are used; but one of the madder reds, or vermilion, should be mixed with them. A much richer purple than any of the above mixtures will give is produced by Prussian blue and one of the lakes from cochineal—viz. carmine or crimson lake—but it is not permanent, and this purple, as well as that obtained by mixing Indian red with indigo, also fugitive, was much used by water-colour painters in past years. Purple madder is the only simple purple pigment available for the artist who is durable, and it is unfortunately costly. All purples are changed to neutral and grey tints by the addition of any yellow pigment. For house-painting moroou lake with a little French blue gives a useful purple; but some of the above mixtures also are occasionally used.

There are several ways of dyeing textile fabrics of a purple or closely similar colour. The most ancient dyes was the Tyrian purple, which is said to have been discovered at Tyre many centuries before the Christian era. Among the Romans this colour was exclusively employed for dyeing the imperial robe. It was obtained from shellfish belonging to the genera Marua, Parpura, and Rucenmum; at least it has been supposed that it was prepared from one or more species of these. The colour was so costly that in the time of Augustus one pound of it sold for what would amount to £36 sterling. About the year 1651 what is believed to be the same or a closely similar purple was obtained from uric acid by a peculiar treatment (see MUREX; Dying, Vol. IV. p. 139; and PHENICIA). Archil (q.v.) seems to have been the only simple purple dye known in the middle ages. Purple of Caisius is a compound of gold and tin used in enamelling (q.v.). For oil-borders (q.v.) the Tyrian purple was used in manuscript painting. It was discovered at Leyden by Andrew Cassius about 1883. A preparation of this colour was formerly used for painting miniatures in water-colour; but for this purpose purple madder, being cheaper, has taken its place.

Purple Emperor (Apatura iris), one of the largest of British butterflies, and one of the most richly coloured. The span of wings is from 2½ to 3½ inches. The wings are strong and thick, and
the flight is very vigorous. The male flies especially high, and will perch on lofty trees. The exterior larva is green and feeds on sallow.

**Purpura.** See Wheat.

**Purplc Wodd, or Purplc Heart.** The heartwood of *Copaeira publis flora* and *C. bracteata,* a very handsome wood of a rich plum colour. The trees producing it are natives of British Guiana, and its chief use in England has been for making ranforps for guns.

**Purpura,** a genus of marine Gasteropode, from some species of which (e.g. *P. petulata,* as well as from *Murex,* the famous Tyrian purple dye was derived. *P. lapillus* (the Dog Whelk) is common on most British coasts, and from it also the dye is procurable. See WHELK.

**Purpura,** or The Purpures, is a malady which is often erroneously placed amongst the diseases of the skin. It is in reality a blood disease, and is characterised by the appearance of small round spots, of a deep purple colour, which are seen first and most abundantly on the legs, afterwards extend to the arms and trunk. They are accompanied by no local pain, are not effaced by pressure (being due to a drop of blood extravasated beneath the cuticle or in the structure of the skin itself), do not rise above the surrounding surface, and are sometimes determined with livid patches resembling bruises; and, before disappearing, both the round spots and the patches undergo the same change of colour which a bruise undergoes. These spots are not peculiar to the skin, but occasionally occur upon internal surfaces and in the tissues of the viscera. Passive haemorrhages from the mucous membranes frequently accompany the external symptoms. There is usually much debility, and often a great tendency to faintness. The duration of the disease varies from a few days to a year or more. Slight cases are devoid of danger, and even the hemorrhagic cases usually recover, unless the bleeding has been excessive or the blood has been extravasated into a vital organ.

Precisely similar appearances occur in the course of other diseases, especially scarlet fever, scarlet fever, and smallpox. But the name purpura should be restricted to the cases in which no such disease is discoverable.

The causes of purpura are obscure. The treatment which succeeds best varies in different cases, but the main indication always is to correct the condition of the blood.Arsenic, mercurial, sulphuric, and nitric acetate of lead, gallic acid are the drugs which are generally most beneficial; rest in bed, light diet, and laxatives are desirable at the commencement. When there is reason to believe that the disease is dependent upon depressing influences a nutritious diet, tonics, and stimulants are required; but chalybeates should be avoided. If the hemorrhage proceeds from accessible parts, local measures, such as the employment of ice or strong astringents, should also be had recourse to.

**Purser,** the name formerly given to the officers in the navy who had the charge and issue of the provisions, slops, soap, tobacco, &c., and who also kept the ship's books; the title was one of the oldest in the service, but the holders of it for long only ranked as warrant-officers, and their duties and responsibilities were in many respects very ill-defined. In the old war-days they were looked upon with great dislike by the seamen, as they were credited with enriching themselves at the expense of the men, and unreasonably the opportunities for sharp practice in their department were considerable, as also for making money by methods which were not always legitimate; much of this, however, was due to the laxity of the system of victualling and of keeping the ship's accounts in those days. In 1844 this branch of the service was completely reorganised, paymaster being substituted for the title purser; and the officers composing it are now drawn from a much higher class than formerly, coming generally from the same station in life as the combatant officers. See PAYMSTERS.

**Purslane** (Portulaca), a genus of plants of the natural order Portulacaceae, having a thick calyx, four or six petals, eight or sixteen stamens, and a capsule dividing around the middle. Common Purslane (*P. oleracea*) grows in cultivated and waste grounds on the seashore in almost all tropical and subtropical parts of the world. It is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and ovate fleshy leaves, which, as well as the young shoots, are frequently used in salads. The young and tender shoots are pickled in France like gherkins. Purslane is not so common in British gardens as it once was. Some species of Portulaca, such as *P. grandiflora,* of which there are several brilliant varieties, and *P. gilliesii,* are choice half-hardy annuals occasionally cultivated in British gardens. They are reared in hotbeds in spring and planted out in the flower-garden in the end of May, or they are grown in pots exclusively for the purpose of decorating the greenhouse.

**Pursuivant.** See HERALD.

**Pus** is a well-known product of inflammation, and occurs as a thick yellow creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar colour, usually an alkaline reaction, and a specific gravity of about 1·032. Like the blood, it consists of certain definite microscopic elements, and of an intercellular fluid or serum in which they swim.

Of microscopic structure (1) the leucocorpuscles, which, both in their chemical and physiological relations, seem to be identical with the lymph-corpuscles, or colourless blood-cells; in diameter they range from 0·004 to 0·005 of a line, and each corpuscle consists of a cell-wall, which often appears granular, of viscid transparent contents, and of one or more nuclei, which can be rendered much more apparent by the addition of acetic acid. The other elements are (2) molecular granules and (3) fat-globules. The serum of pus is perfectly clear, of a slightly yellow colour, closely resembling the blood-serum, and coagulates on heating into a thick white mass.

The chemical constituents of pus are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180), fats (from 9 to 25), extractive matter (from 19 to 29), and inorganic salts (from 5 to 13), in addition to which mucin, pyroglutelin, urea, &c. are occasionally present. Of the inorganic or mineral constituents the soluble salts are to the insoluble in the ratio of 8 to 1, and the chloride of sodium (the chief of the soluble salts) is three times as abundant as the serum of the blood. The mode of formation of pus is described in the article SUPPURATION.

**Pusey, Edward Bouverie,** was born in the year 1800 at Pusey in Berkshire. He was descended from a family of Flemish refugees; his father was
the youngest son of the first Viscount Folkestone, and had assumed the name of Pusey when the estates in Berkshire were bequeathed to him by his father. He was educated at Eton and Christ Church, Oxford, and was elected a Fellow of Oriel College in 1823. As soon as he had completed his studies at Oxford he passed to Germany, partly to study German, which was in the Oxford of those days practically an essential element in the preparation to Holy Eucharist languages, and partly to become acquainted with the latest forms of German theological teaching. In 1827 he returned to England, and in the following year the Duke of Wellington appointed him regius professor of Hebrew in Oxford University, a position which he retained until his death. Although his fame in other respects has caused his Hebrew lecturing to be forgotten, he laboured most unwearily in the duties of his chair, and attracted a great number of pupils. His first work was an essay in which he sketched the causes that contributed to the Rationalistic character of recent German theology. He acknowledges his indebtedness to Professor Tholuck for some portions of this essay, but the elaborate proof of his position was his own work executed with characteristic thoroughness. It was several years before the English church felt entirely the direction of the Rationalistic teaching with which it dealt; the charge was greatly exaggerated, besides being caused in part by vagueness of expression throughout the volume. His main position was unassailable; German Rationalism he maintained was the consequence of the spiritual declension of the orthodox Lutheran church. He was misunderstood as if he had attacked the creed of the Lutherans in its orthodox portions; as a matter of fact he only wished to attribute Rationalism to the want of life in the Lutheran body. But many of his statements were in later years very unsatisfactory to himself, and he withdrew the work from circulation. The whole aim of his life was to prevent the spread in England of Rationalism such as that with which he had become familiar in Germany. Hence, when in 1833 John Henry Newman with the same object began the issue of the Tracts for the Times, Pusey very soon joined him, and they, with Keble, were the leaders of this eventful effort. Their object was not to attack the statements of Rationalistic teachers; there was as yet no call for that in England; but they desired to stir up in the Church a spiritual life and power which would be of itself the best preservative against the infection of the Rationalistic spirit. For this purpose they attempted not to reform, but to restore; they appealed to the idea of the church, to its divine institution, to its services, to its sacraments, to its formulas of faith, to its history, and to the examples of the holiest lives in former generations. They endeavoured to make the church live again before the eyes and minds of men as it had lived in times past. In this connection Pusey wrote his contributions to the Tracts for the Times, especially on the Spiritual Life, and on the Eucharist. His sermons also were vigorous appeals to live the Christian life, and careful expositions of the doctrines which the church from the first had taught. With a similar purpose also in 1836 he commenced the Tracts for the Times, on the genuine writings of the ancient fathers of the Christian church. Under the title of the Oxford Library of the Fathers, Dr Pusey's chief contributions to it were a translation of St Augustine's Confessions and of several of the works of Tertullian. The result of these efforts—to which, with others, he contributed his share—was the establishment of Pusey's name as one of the chief figures in the Oxford Movement. Pusey entirely devoted himself—was most conspicuous, and extended far beyond the ranks of those who were called by their opponents either Newmans or Puseytizes. But the work was checked by the action of the authorities at Oxford. First Newman's celebrated Tract 90 was condemned in 1841, and in 1843 Pusey was suspended for three years from his professorship. The occasion of this suspension was a sermon on the Holy Eucharist which he preached before the University, and which a board of six doctors of divinity, without allowing Pusey a hearing, or specifying the points on which he was supposed to have transgressed the laws of the University, condemned as contrary to the teaching of the Church of England. As soon as an opportunity offered Pusey reiterated his teaching, and this time he was un molested. But before his suspension was over Newman had joined the Roman Catholic Church, and this event left Pusey without any of his leading disciples. All ranks were divided into certainty of Pusey soon following; but those who knew him best were assured that never for one moment did he entertain any thought of leaving the Church of England. With Keble he at once set himself to reassure those who were reeling under the blow of Newman's departure; and it was mainly the moral weight of Pusey's work and character which prevented the powerful efforts of Newman between 1833 and 1841 from resulting in a catastrophe greater than any which the English church had suffered. The continuance of unfailing loyalty to the church and deep conviction of God's presence with it, his buoyant hopefulness even in the darkest days, and his great patience cheered and settled many anxions hearts, and stopped others who were on the point of following Newman. His attitude would have had a yet wider result, except for the sad events which followed in rapid succession in the ten years subsequent to Newman's secession. The new power which a civil court had acquired over doctrinal suits—which was exhibited in the judgment in the Gothic case—the constant anxiety of bishops, and others upon the Oxford movement, the practical inhibition of Pusey from all ministerial work in the diocese of Oxford by Bishop Wilberforce, whereby it was made to appear that the church disowned his teaching—these and other less important but significant events caused the departure of the Roman Church of another band of distinguished men, including Archdeacon (Cardinal) Manning and Archdeacon Wilberforce. But still Pusey laboured on, carefully defining the exact position of the English Church, as against Roman claims on the one hand, and against Zwinglianism and Erastianism on the other.

Only the chief of his numerous writings during this period can be alluded to. They included a lengthy letter on the practice of confession, The Church of England leaves her children; free to whom to open their griefs (1850), a treatise the form of which makes it appear to belong to a moment of controversy, although the matter is really of permanent value; a general defence of his own position in A Letter to a Londoner in 1851; a work on The Royal Supremacy under Henry VIII, and an account of the Oxford Eucharistic Controversy, and of the Church of which Kings are members, in 1850; a larger book on The Doctrine of the Real Presence, as contained in the Fathers (1851), and as taught in the Church of England (1857). In this class of writings may be included also Dr Pusey's Eirenicon (1869, iii. in 1870). The object of these volumes was to clear the way for reunion between the Church of England and the Church of Rome on the basis of Catholic, as distinct from Roman Catholic, doctrine and practice. The work was undertaken at the University, which was undertaken after the report of the first Royal Commission on the Universities, and which destroyed for ever the integrity of the originally most intimate bond between the University and
the Church, greatly occupied Pusey's mind. His evidence before the commission, his remarkable pamphlets on the comparative advantages of Collegiate and Parochial Training, and his advice to the Proprietors of Sanchar Schools, his practice of celibacy, and his assistance to the Hebdomedal Council for many years are proofs of the interest that he took in the welfare of his university, and of the importance that he attached to a close connection between education and religion.

Pusey opposed his friend's plan as carefully as he supported it. He disapproved of Pusey's views. The teaching for which the Tractarians had laboured and suffered was at that time beginning to be recognised, and those disciples of the Oxford movement who had survived the shock of the events of the last twenty years were spreading its principles throughout the country. But the fruits of the intolerance and persecution of which Oxford had been the scene were also ripening in the form of the spread of religious indifference, based on Rationalistic views of revelation. This was the enemy which from the first Pusey had dreaded. He had at least the satisfaction of knowing that, as a result of the movement in which he had taken so prominent a part, the inner life of the English Church was far better able to bear the onset of such a foe, and to estimate the moral and spiritual resources which would make it strong, as the Lutheran body of the 18th century, or even the Church of England in 1830. Against such teaching he contended for the rest of his life. All his later sermons before the university and most of his later books deal with it. It was with this purpose that he composed Professor Dowett's pamphlet. He contributed to his statements in his commentary on St. Paul's Epistles, and that he took so prominent a part in the later controversy about the Athanasian Creed. His chief works in this connection are the Lectures on the Book of Daniel, and What is owing to Excessive Punishment? The former, delivered in 1863, vigorously attacked those writers who would assign to the Book of Daniel a date as late as the 2d century B.C. Apart from the marks which the lectures bear of the heated controversy of the time, they are an admirable demonstration of the author's intellectual power, wide reading, and solid learning. The other book is against the denial of everlasting punishment; its sobriety and fullness, the familiarity which it shows with all the issues raised in the controversy, is due to its respect for its character and calm tone make it one of the most remarkable of Pusey's works. Of a kindred character, although in a different field, are the last two university sermons which he wrote—on the relation of science to faith and on the nature of prophecy.

Two other works must be noticed. Pusey inherited from his predecessor in the Hebrew chair the task of completing A Catalogue of the Arabic Manuscripts in the Bodleian Library (1835). It was a great task, and it occupied his time for six years. Pusey's Commentary on the Minor Prophets (1860-77) was his contribution to a commentary on the whole Bible which he had in his mind for many years, and on which he enrolled the labours of Kühle and many others. Pusey himself undertook a part of it, and advancing years, for the claims of other duties prevented the others from contributing their share.

In private life Pusey was a man of warm affection, and widely known for his gentleness, sincerity, and munificence. He seems to have been at ease in early life at first withdrew from it for purposes of study and to save more money to give to the poor, but from the time of his wife's death in 1839 he avoided all social amusements. But he was always accessible to any one who wished his advice on religious questions; in fact, he was constantly sought as a spiritual guide by persons of every station. His charity was bounded only by his income; besides abundant gifts to poor people, he supported by his own money the work of providing churches in East London, in building St. Saviour's, Leeds, and in founding and supporting sisterhoods. His capacity for study and for literary work was immense. He worked only at what it was his duty to study, but within that line he spared neither time nor pains in reaching every detail. His power of keeping his main object before his mind without being confused by its details, and of grouping the details in their due position, can be seen in almost any of his works. Opponents of all schools gave him the credit of being confused; but an occasional confusion in his manner of expressing his thoughts did not prevent him from knowing his own mind with singular clearness. He died on 16th September 1882.

The Life of Pusey by Canon Liddon, left unfinished at his death, was completed by a present writer, the Rev. R. J. Wilson, the Canon's literary executors (5 vols. 1883-99).

Pushkin, Alexander Sergeevich, was born at Moscow, 23rd May 1799, and educated at Tsarskoe Solo. In 1817 he entered the service of the government, but on account of his liberal opinions was for some time transferred to Bessarabia. In 1820 he published his first romantic poem, Rudan and Ljudmila. Next came his Prisoner of the Caucasus (1822), his Fountain of Bakhchisarai (1826), Tartan (The Gypsies, 1827), and Eugene Onegin (1828; Eng. trans. 1881), a clever novel in verse. Meanwhile, his new style began. In 1829 he published Poltava, which has Mazeppa for its hero. About the same time he wrote his fine tragedy Boris Godunov. Besides these works of considerable length, he was the author of many graceful lyrical poems, deservedly popular throughout Russia. He also left some prose writings, consisting of a History of the Revolt of Pugachev (in the reign of Catherine), several tales, and miscellaneous essays. He was appointed Russian historiographer with a pension of 6000 roubles. He was mortally wounded in a duel, and expired at St. Petersburg, January 20 (February 10) 1837. Pushkin is considered the greatest poet whom Russia has yet produced. His writings show versatility, a powerful imagination with vigour of expression. In his Eugene Onegin, a Don Juanesque poem, he is both humorous and pathetic, and many of his smaller pieces display wonderful elegance and finish.

The last named poem was translated into English verse by Spalding (1881); the Daughter of the Commandant was translated in 1891; and a translation of the Poems, with introduction and notes by Ivan Panin, appeared at New York in 1889. Pushkin's name is also spelt Ponshkin and Pouchekin. See the section on the literature under Russia, and works there cited.

Pushin, or Pukhov, the language of the Afghans (see AFGHANISTAN), is, according to Darmester, not intermediate between the Iranian and Indic branches of the Aryan stock, but is directly derived from the Zend, with Persian, Hindustani, and Arabic admixture. See Stropp's Pushto Grammar (1873), Strangford's Letters and Papers (1872), and Darmester's Chants Populaires des Afghans (1890).

Pustule, a circumscribed elevation of the cuticle, containing pus: in fact, a small abscess in the skin. Pustules occur in many skin diseases—eczema, acne, scabies, ophthia, boils, &c.; and very prominently in smallpox. For Malignant Pustule, see ANTHRAX.

Puteaux, a town 2 miles from the western boundary of Paris, on the left bank of the Seine,
opposite to the Bois de Boulogne. Many Parisians have fine villas here. There are manufactures of dyes, dyes and chemicals, dyeing, and calico-printing. Pop. 15,151.

Puteo1. See PozzUOLL.

Putnam, a town of Connecticut, on the Quinnipiac River, 56 miles by rail from New Haven, has manufactures of cottons, boots and shoes, &c. Pop. (1900) 7348, including Putnam city (6667).

Putnam, Israel, a general of the American Revolution, was born in what is now Danvers, Massachusetts, 7th January 1718. In 1739 he bought a farm between Pomfret and Brooklyn, Connecticut, and for many years devoted himself to its cultivation, gaining meanwhile a high reputation for courage by such personal exploits as following a she-wolf into her lair and killing her single-handed. In 1755 he left as a captain in a contingent of 1000 men which Connecticut sent to repel a threatened French invasion of New York, and was present at the battle of Lake George. In 1758 he was captured by the savages, tortured, and then bound to a tree, and was about to be burned to death when a French officer scattered the fire-hounds and rescued him. In 1739 he received a regiment, and in 1746 he went in the dreadful West India campaign which resulted in the capture of Havana, and in 1704 he helped to relieve Detroit, then besieged by Pontiac (q.v.). Ten years of quiet at home succeeded, during which he made his farmhouse into an inn, and was conspicuous among the "Sons of Liberty." In 1773, after Concord, he was given the command of the force of Connecticut, and was ranking officer on the day of Bunker Hill, though not in actual command at either the redoubt or the rail-fence. He was next appointed by congress one of the four major-generals, and held the command at New York, and in August 1776 at Brooklyn Heights, where he was defeated by General Howe on the 27th. He afterwards held various commands, and in 1777 was appointed to the defence of the Highlands of the Hudson. While at Peckskill a lieutenant in a loyalist regiment was captured as a spy and condemned to death; and, on Sir Henry Clinton's sending a flag of truce threatening vengeance if the sentence should be carried out, Putnam wrote a brief and characteristic reply: "Headquarters, 7th August 1777.—Edmund Palmer, an officer in the 19th regiment, was taken as a spy by Hessians within our lines; he has been tried as a spy, condemned as a spy, and shall be executed as a spy, and the flag is ordered to depart immediately.—Israel Putnam.—P.S.—He has accordingly been executed." In 1778, in western Connecticut, Putnam made his famous escape from Governor Tryon's dragoons by riding down the stone steps at Horseneck. The next year he had a stroke of paralysis, and the rest of his life was spent at home. He died 19th May 1790. See Life by Increase Grant (1875), and article by Professor John Finke in Appleton's Cyclopaedia of Amer. Bioy. (1888).

His cousin, Rufus Putnam, born 9th April 1738, served against the French from 1757 to 1759, and then settled as a farmer and millwright. On the outbreak of the war he received a lieutenant-colonel's commission, and returned West. He served as an engineer. In 1778 he helped his cousin to fortify West Point. Afterwards he commanded a regiment till the end of the war, and in 1783 he was promoted to brigadier-general. In 1788 he took part in the Constitution; in 1793 he was appointed a judge of the supreme court of the North-west Territory; and from 1793 to 1803 he was surveyor-general of the United States. He died in Marietta, 1st May 1824.—Israel's grand-nephew, George

Palmer Putnam, born in Brunswick, Maine, 7th February 1814, in 1840 became partner in the book-store of Willey & Putnam, New York, established a branch in London in 1841, and in 1848 returned to the United States and started a new house. In 1852 he founded Putnam's Magazine. In 1863 he retired from business, but in 1866 he established the firm of G. P. Putnam & Sons (now G. P. Putnam's Sons). He died 20th December 1872. He wrote the book compiled several books, and was the author of the first "Plea for International Copyright" (1857) printed in Amerin.

Putney, a suburb of London, in Surrey, 6 miles WSW. of Waterloo, on the south side of the tidal Thames, which, here nearly 300 yards broad, is crossed by a new granite bridge (1854–86), leading to Putnam, and founded and opened by the Prince of Wales. It is a great rowing place, the starting-point of the Oxford and Cambridge boat-races, and from its ready access to Town, the river, Putney Heath, and Wimbledon Common, has grown rapidly of recent years, its principal feature that there are no poor. The parish church, with a 15th-century tower, is in the country of Putney Heath. The Present was mainly rebuilt in 1830; in the churchyard is Toland's grave. Putney is the birthplace of Thomas Cromwell and Gibbon, the residence of Mr Theodore Watts and Mr Swinburne, and the death-place of Pitt and Leigh Hunt. From Putney's old bridge a Mary Wood flew down herself; and on Putney Heath Pitt fought his duel with Tierney (1708), Castlereagh his with Canning (1800). Pop. (1851) 5250; (1881) 13,255; (1891) 17,771.

Putrefaction is the term given to the decomposition of organic substances when accompanied by an offensive chemical change due to the complexity, resulting instability, and affinity for oxygen of organic matter. It is now known to be the result of the living activity of certain minute plants called Bacteria (q.v.), which also cause Fermentation (q.v.) and many diseases (see GERm). The spores of these plants are present in great numbers in the lower levels of the air, in water, and on the surface of the earth; and, as they are only about 0·001 mm. in diameter and two to four times as long, it is not surprising that they were not seen, and that putrefaction was supposed to be spontaneous. But, if we boil an infusion of tar or turpentine in a closed vessel it will remain without any change for years, but will begin to putrefy in a day or two if the plug be removed. A low temperature, although it will not kill the bacteria, will stop their growth and the resulting destructive changes; hence the use of freezing food on shipboard. Salicylic, carabolic, and other acids also check putrefaction, but are now known to be only a few poisons, such as corrosive sublimate, chlorine, and bromine, that actually kill. Drying stops growth and kills the developed plant in a few days, but the spores will live for a long time in a dried condition. The effect of oxygen is different, some species require oxygen to hindered in their growth by it; and a high pressure of oxygen will kill over those kinds that need a certain amount in a few days. Of the precise chemical changes that take place as a result of the life of bacteria we are still largely ignorant; but the chief fact now is that these changes are dependent under Fermentation. For an investigation in the causes of putrefaction, see Tyndall's Floating Matter of the Air (1851).

Putrid Fever. See JAIL FEVER.
PYEMIA

It is a municipal borough, uniting with Carnarvon, &c. to return one member. Pop. of parish, 3222.  

Pyemia (from the Gr. πυς, ‘pus’ and ήaimα, ‘blood’), or purulent infection of the blood, is a disease whose exciting cause is the introduction of decomposing pus or wound discharges, or the products of decomposition of animal fluids, into the circulation, either by an ulcer imperfectly closed (see Pileritis and Perforal Feyer). The term Septicismia is applied by some to the same disease, by others only to very grave cases of pyemia; while by many it is restricted to cases of blood-poisoning by pathic animal matters, which, having failed to decompose, are expelled from decomposing wounds or dead bodies, or borne on foul air or septic gases. The two conditions have a general resemblance to each other. The poison is rapidly absorbed and diffused, and the blood undergoes certain changes, the nature of which chemistry has as yet failed to detect; it is certain, however, that the blood contains micro-organisms (mierococci and bacteria; see Germ). Within twenty-four hours, in very acute cases, there are severe shiverings, headache, and giddiness followed by a loss of consciousness or delirium. In twenty-four hours more the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases the symptoms closely resemble those of typhoid fever, and in this form the disease is a common cause of death after surgical operations. Its most conspicuous character is the formation of secondary abscesses in the lungs, liver, kidneys, and other internal organs, in the various glands (the parotid gland in President Garfield’s case), in the joints, and in the tissues immediately under the skin. The pus of such abscesses always contains bacteria. There is usually more or less delirium. The patient generally dies of exhaustion. Recovery is rare. It is chiefly, however, in the presence of predisposing causes, such as previous illness, prostration from organic disease or surgical complaints, or from difficult parturition, unhealthy occupations, &c., that the poison acts so severely; these, with the occurrence of putrefaction in a wound, may convert a comparatively slight local mischief into infection of the whole mass of the blood.

Bearing in mind that the micro-organism which pyemia originates, it is clear that this disease is one to be prevented rather than cured. Until comparatively recently, when it was acknowledged that pyemia was the cause of death in 10 per cent. of all cases of amputation, the careful preparation of a patient before operation was, with justice, most strenuously insisted on. ‘Patients must be strengthened,’ said Mr Callender, ‘by tonics, such as quinine and iron; and their secretions must be set right by appropriate alteratives; this treatment must be continued for a considerable period.’ Diet should be attended to, and temperate patients should be accustomed to a more healthy mode of life. After operation, also, patients should be adequately supported with nutritious diet, and not with stimulants, mere stimulants. The principal minerals are coal and lead. Hot and cold mineral springs are abundant, among the most frequented being those of Mont Dore (q.v.), Châteauneuf, St Nectaire, Royat, Châteldon, &c. The department is subdivided into the arrondissements of Ambert, Clermont-Ferrand, Insole, Rom, and Thiens. Capital, Clermont-Ferrand.

Puzzle-monkey. See Araucaria.

Puzzola’na. See Cements.

Pwllhleli, a brisk little seaport and popular watering-place, 22 miles by rail S. by W. of Carnarvon in Wales, with lobster and oyster fisheries.

Pyemia

etc. to return one member. Pop. of parish, 3222.

Pyemia (from the Gr. πυς, ‘pus’ and ήaimα, ‘blood’), or purulent infection of the blood, is a disease whose exciting cause is the introduction of decomposing pus or wound discharges, or the products of decomposition of animal fluids, into the circulation, either by an ulcer imperfectly closed (see Pileritis and Perforal Feyer). The term Septicismia is applied by some to the same disease, by others only to very grave cases of pyemia; while by many it is restricted to cases of blood-poisoning by pathic animal matters, which, having failed to decompose, are expelled from decomposing wounds or dead bodies, or borne on foul air or septic gases. The two conditions have a general resemblance to each other. The poison is rapidly absorbed and diffused, and the blood undergoes certain changes, the nature of which chemistry has as yet failed to detect; it is certain, however, that the blood contains micro-organisms (mierococci and bacteria; see Germ). Within twenty-four hours, in very acute cases, there are severe shiverings, headache, and giddiness followed by a loss of consciousness or delirium. In twenty-four hours more the patient may be in a hopeless condition, delirious, and rapidly sinking. In less acute cases the symptoms closely resemble those of typhoid fever, and in this form the disease is a common cause of death after surgical operations. Its most conspicuous character is the formation of secondary abscesses in the lungs, liver, kidneys, and other internal organs, in the various glands (the parotid gland in President Garfield’s case), in the joints, and in the tissues immediately under the skin. The pus of such abscesses always contains bacteria. There is usually more or less delirium. The patient generally dies of exhaustion. Recovery is rare. It is chiefly, however, in the presence of predisposing causes, such as previous illness, prostration from organic disease or surgical complaints, or from difficult parturition, unhealthy occupations, &c., that the poison acts so severely; these, with the occurrence of putrefaction in a wound, may convert a comparatively slight local mischief into infection of the whole mass of the blood.

Bearing in mind that the micro-organism which pyemia originates, it is clear that this disease is one to be prevented rather than cured. Until comparatively recently, when it was acknowledged that pyemia was the cause of death in 10 per cent. of all cases of amputation, the careful preparation of a patient before operation was, with justice, most strenuously insisted on. ‘Patients must be strengthened,’ said Mr Callender, ‘by tonics, such as quinine and iron; and their secretions must be set right by appropriate alteratives; this treatment must be continued for a considerable period.’ Diet should be attended to, and temperate patients should be accustomed to a more healthy mode of life. After operation, also, patients should be adequately supported with nutritious diet, and not with stimulants, mere stimulants. The principal minerals are coal and lead. Hot and cold mineral springs are abundant, among the most frequented being those of Mont Dore (q.v.), Châteauneuf, St Nectaire, Royat, Châteldon, &c. The department is subdivided into the arrondissements of Ambert, Clermont-Ferrand, Insole, Rom, and Thiens. Capital, Clermont-Ferrand.

Pwllhleli, a brisk little seaport and popular watering-place, 22 miles by rail S. by W. of Carnarvon in Wales, with lobster and oyster fisheries.
at Lyons, where it formerly had a permanent home; and similar testimony might be quoted from every quarter and to any extent. The use of antisepsics, adopted early and followed out intelligently, may be said to have abolished the risk of purulent infection in operated cases from operation and injury.

Even when the disease has shown itself, the use of antisepsics (perchloride and other salts of mercury, carbolic acid, boracic acid, boroglyceride, iodiform, thymol, eucalyptol, &c.) should be reported to locally. The hands, skin, and kidneys may be acted on by suitable purgatives, diaphoretics, and diuretics, with a view to the elimination of the poison; but the patient must be carefully watched for signs of depression, which must be combated with opium and stimulants, both of which should be given in small and frequently repeated doses. Quinine in moderately large doses is very serviceable throughout the whole course of such a case; larger doses may occasionally be given to reduce excessively high temperatures, though antipyretics in general must be used with extreme caution in various antisecptic drugs have been recommended for internal use, such as salicylic acid and the salicylates, the hypsophilate of sodium, and the hypophosphites generally. This treatment, combined with the most assiduous nursing and generous dieting, and the appropriate surgical measures, if secondary abscesses form, will sometimes prove successful.

Pyat, Felix, a French journalist and communist, born at Vierzon (dept. Cher), on 4th October 1810, studied law and in 1831 was admitted to the bar, but chiefly wrote articles, feuilletons, and plays, often with strong political allusions. He signed Ledru-Rollin's appeal to the masses to arms in 1848, and the attempt to avoid failure escaped to Switzerland. After that he found refuge in Belgium and England, and was a member of the 'European revolutionary committee'. Returning to France on amnesty in 1870, he made himself a leader of the Paris communists and took a foremost part in the destruction of the Vendome Column; on the fall of the Commune he escaped to London. He was tried and condemned to death, in absence, in 1873, for his share in the misdeeds of the Communal Government, but was pardoned in 1880. Marseilles chose him one of her deputies in 1888. He died 5th August 1890 at Sir Gatien.

Pycnogonida, a very remarkable group of Arthropod animals, perhaps intermediate between Crustaceans and Arachnida. The body consists of a fused cephalothoracic region, three free thoracic segments, and a rudimentary abdomen. The head usually bears a tubular proboscis, a pair of mandibles, a pair of slender palps, and a pair of egg-carrying legs; but mandibles and palps may be absent, and the egg-carrying legs are sometimes restricted to the males. Besides these there are four pairs of clawed limbs, into which prolongations of the gut extend. There is a dorsal heart; respiration is effected through the skin. The males usually carry the eggs. There is a metamorphosis in development. The pycnogonida are some of the most beautiful of all sea-plants and also Pantopoda. They are all marine, and some of them live among algae, or are to be found under stones on the beach, whilst others are dredged from deep waters. They seem to feed by sucking other animals. See Hooke, Challenger Report (iii. 1880); and Dohrn, Fauna d. Golfs v. Neapel (iv. 1881).

Pycnogonum littorale.

Pyce, Henry James, poet-laureate, was born in London, 10th July 1754, and educated at Magdalen College, Oxford, in 1772 being made a D.C.L. He held a commission in the Berkshire militia, in 1784 was elected librarian for that county, in 1790 succeeded Warson as laureate, and in the same year was appointed a London police magistrate. He died at Pinner, near Harrow, 13th August 1813. The works of 'poetical Pye' (in Scott's phrase), who, as the editor of Byron's Vision of Judgment remarked, was 'eminently respectable in everything but his poetry,' are nearly twenty in number, and include Alfred (1801), besides birthday and new-year odes.

Pygmaleon, grandson of the king of Cyprus, in love with an ivory statue of a maiden he had made, prayed to Aphrodite to give it life; and, his prayer being granted, married the maiden. There is no classical authority for calling him Gala.

In his Pygmaeon and Galatea W. S. Gilbert followed a German play.

Pygmes. See Dwarf; Quatrefages, Les Pygmées (1887); and for the two types of pygmies whom Stanley saw in the Central African forest, see In Darkest Africa (1890), and Hurwitz, In the Land of the Pygmies (1899).

Pyldades. See Orestes.

Pymun. John, was born of a good old Somersetshire stock, at Ilminster, in the county of Bridgewater, in 1554. He entered Broadgates Hall (now Pembroke College), Oxford, in 1570, as a gentleman-commoner, but left in 1602 without taking a degree, and then probably studied law at one of the Inns of Court. He married in 1614, but in 1620 was left a widower with five young children, and was first returned to parliament by Calne. This seat he exchanged in 1625 for Tavistock. He at once attached himself to the Court party, and proceeded to war against monopolies, papistry, the Spanish match, and absolutism with a vigour that brought him 'three months' duration. He was one of the members who presented a petition to James I. at Newmarket, when 'Chairs! cried the king, 'chairs! here be twal kynges comin!' and in 1626, the year after the accession of Charles I., he took a prominent part in the impeachment of the Duke of Buckingham. In the parliment he stood second only to Sir John Eliot, whom he ably supported in the debate on the Petition of Right, but whom he opposed in the matter of tonnage and poundage, deeming the privileges of parliament inferior to the liberties of the kingdom. In the short Parliament (1640), of which Clarendon says, 'men gazed on each other, looking who should begin, much the greater part having never sat before,' Pym on 17th April 'brake the ice by a two hours' discourse, in which he summed up shortly and sharply all that was most reflected upon the prudence and justice of the government, that they might see how much work they had to do to satisfy their country.' And lastly, in the Long Parliament, having meanwhile joined hands with the Scots, and ridden with Hampden through England, urging the voters to their duty, Pym in November named Strafford, twelve years earlier his friend and ally, as the 'principal author and promoter of all those counsels which had exposed the kingdom to so much ruin.' In the impeachment of Strafford which followed, resulting in his execrable death by hanging, Pym under a leading part; and Pym's is the chief credit of this master-stroke of policy, which deprived the king of the one man of resolute temper and powerful genius who supported his cause. In the proceedings against Land Pym was also conspicuous, as in the carrying of the Grand Remonstrance and in every other crisis of moment up to the time when war became inevitable; he was the one of the 'Five
PYRACANTHA

Pyramid, in Geometry, is a solid figure, of which the base is a plane rectilinear figure, and the sides are triangles, converging to a point at the top or ' apex.' Pyramids, like prisms, are named from the form of their bases; thus, a pyramid having a triangle for its base is a triangular pyramid, with a square base, a square pyramid, with any four-sided figure for its base, a quadrangular pyramid; or it may be pentagonal, hexagonal, &c. Pyramids may be either 'right' or 'oblique' (see Prism). A right pyramid, with an equilateral figure for its base, has all its sloping edges equal; but this is not the case if the pyramid be oblique. The most remarkable property of the pyramid is that its volume is exactly one-third of that of a prism having the same base and height; and it follows from this that all pyramids having the same base and height are equal to one another. The word (Gr. pyramis) is of Egyptian origin.

Pyramid, a structure of the shape of the geometric figure so called, erected in different parts of the Old and New World, the most important being the Pyramids of Egypt, which were reckoned among the seven wonders of the world. They are about seventy-five in number, of different sizes, situated chiefly between 29° and 30° N. lat., and are masses of stone (or rarely brick), with square bases and triangular sides. Although various opinions have prevailed as to their use, as that they were erected for astrological, astronomical, and metrological purposes, for resisting the encroachment of the sand of the desert, for granaries, reservoirs, &c., there is no doubt that they were really nothing more than the sepulchres of Egyptian kings, from the first to the twentieth dynasty. With the exception of some very late pyramids in Nubia, none were constructed after the twelfth dynasty; the later kings were buried at Abydos, Thebes, and Memphis, either in rock-cut tombs or in construction. The pyramids of Egypt may be described as monuments built over the sepulchral chambers of kings. The Egyptian monarch was ever careful to prepare his 'eternal abode.' For this purpose a shaft of the size of the intended temple was cut down into the rock at an incline suitable for lowering the coffin, and at a convenient depth a rectangular chamber was excavated in the solid rock. Over this chamber a cubical mass of masonry of square blocks was then placed, leaving the oriifice of the shaft open. Additions continued to be made to this cubical mass, both in height and breadth as long as the monarch lived, so that at his death all that remained to be done was to face and smooth the exterior of the step-formed mound by adding courses of large blocks on each layer of the steps and then cutting the whole to a flat or even surface. This outer masonry or casing has in most instances been stripped off. Provision was made for protecting the vertical joints by placing each stone half-way over another. The masonry is admirably finished; and the mechanical means by which such immense masses of stone were raised to their places must have been powerful and elaborate. The finer stones were quarried at Tura and other places on the opposite bank of the Nile; sometimes, however, granite taken from the quarries of Syene was employed for the casing. The entrances were carefully filled up, and the passage protected by stone portcullises and other contrivances, to prevent ingress to the sepulchral chamber. The sides of the pyramids face the cardinal points, and the entrances face the north. The most remarkable and finest pyramids are those of Gizeh (Giza), situated on the edge of the Libyan Desert, near Memphis, on the west bank of the Nile. Of the three largest and most famous the First or Great Pyramid was the sepulchre of Chufu, the second king of the fourth dynasty (2733-2666 B.C., according to Brugsch). Chufu is the Cheops of Herodotus, the Cheops or Chemis of Diodorus, and the Sophsis of Manetho. Its height was originally 481 feet, and its base 774 feet square; in other words, it was higher than St. Paul's Cathedral, on an area about the size of Lincoln's Inn Fields. Its slope or angle was 51° 59'. It has, however, been much despised and stripped of its cubical mass blocks for the building of the mosques and walls of Cairo. The original sepulchral chamber, 46 feet x 27 feet, and 10 feet 6 inches high, was hewn in the solid rock, and was reached by a passage, 200 yards long, descending to the entrance at the foot of the pyramid. The excavations in this direction were subsequently abandoned, and a second chamber, with a triangular

---

**Note:** The text above is a segment from a larger passage, focusing on the description and historical context of pyramids, particularly those in Egypt, detailing their construction, function, and significant characteristics. The passage is intended to provide a comprehensive overview of pyramids, emphasizing their architectural marvels and historical importance. The diagram illustrates a section of a Great Pyramid of Gizeh, highlighting key components and dimensions. The text is complemented by references to historical figures and landmarks, ensuring a rich and detailed understanding of the subject matter.
Pyramid

measure of capacity, of which the British quarter is the fourth part. As the heat of this chamber was stifling, two small air-channels, or chimneys, about eight inches square, were made, ascending to the north and south sides of the pyramid, which perfectly ventilate it. After the mummy was deposited in the King’s Chamber, the entrance was closed with granite portcullises, and a well made at the junction of the upward-inclined and horizontal passages, by which the workmen descended into the downward-inclined passage. According to Herodotus, this pyramid took a long time in construction—100,000 men being employed on it for thirty years. The facing-stones were said to be inscribed with writing, probably of a religious character. The Great Pyramid was opened by the Abbadide or Caliph El Mamun in the 9th century.

The Second Pyramid is situated on a higher elevation than the first, and was built by Chephren (3666-3633 B.C.), third king of the fourth dynasty. It is 450 feet high, on a base of 700 feet, and has two sepulchral chambers, which were opened by Belzoni in 1816. The pyramid is inferior to the first, but it was apparently cased below with polished stones, some of which remain, while the top still retains its original casing.

The Third Pyramid, built by Menkaura, or Mycerinus (3363 B.C.), fourth king of the fourth dynasty, is much smaller than the other two, being only 215 feet high by 350 feet at the base. It has three chambers, the lowest of which, granite lined, held a sarcophagus of white granite, but it is unknown. The inscription on the coffin reads: ‘Osiris, King of the North and South Men-Kau-Ra, living for ever.’ The heavens have produced thee, thou wast engendered by Nut (the sky), thou art the offspring of Seth, thou art Nut who spreads herself over thee in her form as a divine mystery. She has granted thee to be a god. Thou shalt never more have enemies, O King of the North and South, Men-Kau-Ra, living for ever.’ (Dodge, The Nile, 141-142). From this we may conclude that the Egyptian religion and the doctrine of immortality were fixed as early as 3600 B.C. Amongst the débris of the coffin and in the chambers were found the legs and part of the trunk of a body with linen wrapper, supposed by some to be that of the monarch, but by others to be that of an Arab. The plaster of the fragment of the original coffin were removed to the British Museum, but the stone sarcophagus was unfortunately lost off Carthage by the sinking of the vessel in which it was being transported to England. The masonry of this pyramid is magnificent, and it was apparently cased half-way up with granite, the remains of which are still visible. It was wantonly damaged by Saladin’s nephew, El-Kamil, in the 12th century, in the hope of destroying it. The Third Pyramid is regarded with superstitions dread by the natives, on account of a supposed lady’s ghost, and there is a curious legend connecting it with the courteous Rhodope.

There are six other pyramids of inferior size and interest at Gizeh; others at Abun Rodaf, six miles to the north-west of the same spot; and four (originally fourteen) at Abydos (Bunyan’s of Sedma and Us-en-ra of the fifth and sixth dynasties. A group of eleven pyramids remains at Sakkar, some of which were explored in 1880-81 by M. Maspero, such as those of Unas (3333 B.C.), Teti (3266), and Pepi (3233), all of the fifth and sixth dynasties. The so-called Step Pyramid at Sakkara is believed to have been built by Uenephes of the first dynasty. Six pyramids still stand at Dushir and that at Meydum, with a peculiar construction, is supposed to be the tomb of Snefer (3766 B.C.). Chufu’s predecessor in the fourth dynasty. There are also pyramids in the Fayyum, and some small ones of brick at Thebes. In Nubia, the ancient Ethiopia, are several pyramids, the tombs of the monarchs of Merotic from the 1st. B.C. and of some of the Ethiopian conquerors of Egypt. They are taller in proportion to their base than the Egyptian pyramids, and generally have a squarish hall, or propylon, with sculptures, which faces the east.

In Assyria the Bira Nimrud, or Tower of Belus, was a kind of step-shaped pyramid of seven different-coloured bricks, dedicated to the planets by Nebuchadnezzar. The Mijjellia, another mound, was of pyramidal shape. The pyramid
AZTEC PYRAMID, CHOLULA, MEXICO.
PYRENEES

also entered into the architecture of the tomb of Sardanapalus at Tarsus, and of the Mausoleum of Artemisia at Halicarnassus. A small pyramid, the sepulchre of C. Cestius, imitated from the Egyptian in the days of Augustus, still exists within the wall of Aurelian at Rome. Temples and other monumental pyramids of six shape are found in India, China, Cambodia, Java, the Polynesian Islands, and elsewhere. The Toltecs and Aztecs erected temples in Mexico, called Teocalli (q.v.), or abodes of gods, of pyramidal shape, with steps or terraces by which to ascend and reach an altar, generally placed on the summit, on which sacrifices and other rites were performed. These, however, are not true pyramids, the pure and simple form of which is restricted to Egypt. The pyramidal form entered extensively into the architecture of the Egyptians, and appears on the tops of chelisks and tombs as a kind of roof. Small models of pyramids, with inscribed adorations to the sun, or having royal names, were also placed in the tombs.

See Lepsius, Uber den Bau der Pyramiden (1843); Wilkinson, Topogr. of Thebes 1833; Vyse, Operations connected with the Pyramids (1842); Perring, The Great Pyramid (1888). Ingenious fancies about the supposed metrological and astrological purport of the pyramids are given in Piazzi Smyth's Our Inheritance in the Heavens, 1863, and L. W. Howitt, The Great Pyramid (1892). The astronomical data afforded by the orientation of temples and pyramids were in 1891 subjected to thorough investigation by Mr Norman Lockyer.

Pyramids, a game played on a billiard-table. Fifteen red balls are placed on the table in the form of a pyramid, the apex of the pyramid being on the "winning spot," with the base at the foot of the table. There is also a sixteenth white ball, which is used by both players when striking. The object of the players is to hole the pyramid balls. The first stroke is from hand; the succeeding strokes are played from where the white ball stops, unless the striker runs in, when his adversary plays from hand. Also, when only two balls remain on the table, the white and the red are played with alternately. When a player holes a pyramid ball he scores one, and plays again on any ball he likes. If a player runs in or gives a billiard to the first ball, or strikes the red ball, he is replaced on the table on the winning spot, or as near in a straight line beyond it as it will go without touching another ball; if the player has made no score, he owes one, and the first red ball he holes is placed on the table. When all the red balls are holed, the lower score is deducted from the higher, and the difference is the number of lives won. The game is generally played for so much a life, with a stake on the pool equal to the value of three lives. The lives are not paid for when taken (as at pool), but the difference in the scores is recorded on a slate marking-board at the conclusion of each game.

The principal varieties of pyramids are shell out and snooker. Shell-out is pyramids played by more than two persons. The only differences are that, if a player runs in or makes, one is deducted from his score, but no ball is replaced on the table, and that the last ball scores two. At snooker, in addition to the pyramid balls, some of the pool balls (beginning with the yellow) are placed on various spots on the table. A red pyramid ball must first be played, and, if holed, is h 1 oyed, then play on a pool ball. The pool balls score two, three, four, five, and six respectively, according to the order of their colours on the marking-board; running in or missing when playing on a pool ball scores nothing but, if holed, is added to the opponent's score. When a pool ball is holed, it is replaced on its original spot, and the striker must next play on a pyramid ball. When all the pyramid balls have been holed, the pool balls are played on in the order of their colours, but are not then replaced when holed.

A great point is to avoid being "snookered"—i.e. to play on a pyramid ball so that if holed a pool ball is left open, and vice versa. If a player is "snookered," his adversary at once scores the value of the nearest pool ball. Some rules compel the striker to name the ball played at, when, if he fails to hit it, he is snookered off that. The rules of snooker vary much in different rooms.

Pyramus and Thisbe. The tragic history of these two lovers is told by Ovid in the 4th book of his Metamorphoses. They were natives of Babylon, and tenderly attached to each other, but, as their parents would not hear of their marriage, they had to content themselves with clandestine interviews by night. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting-spot, was startled to discover a lioness. She immediately ran off, but in her terror and haste dropped her garment, which the fierce animal, that had just torn an ox in pieces, covered with blood. Soon after Pyramus appeared, and, seeing his mistress's tunic, came to the conclusion that his beloved was dead, and inquired, whereupon he killed himself. Thisbe now returned, and, beholding her lover lying dead on the ground, put an end to her own life. The story was a favourite one during the middle ages. Bottom pronounces it "a very good piece of work and a merry" in A Midsummer Night's Dream.

Pyrenees, the mountain-chain that divides France from Spain, and extends from the Mediterranean to the south-east corner of the Bay of Biscay, a distance of 270 miles; the breadth of the system varies between 5 and 70 miles, and the area it covers measures 13,000 sq. m. The Pyrenees form a regular and continuous chain, divisible into three portions, the Western, the Central, and the Eastern Pyrenees. The first-named division extends eastwards from the Bay of Biscay to the Port de Canfranc (or Col de Somport), a carriageway that crosses the chain at an elevation of 5380 feet, and leads from Oloron to Saragosuza. This division is divided into two sub-divisions, the higher, altitude height being 3300 to 4300 feet. Here two passes give access to Spain, that of St Jean Pied de Port (or Ronclevalles) and that between Bayonne and Elizondo; the railway from Bayonne to San Sebastian passes the end of the chain close to the sea. The Southern Port de Pyrénées is formed by the Port de Canfranc to the Col de la Perche, this connecting the valley of the Frenéli Tet (dept. Pyrénées-Orientales) with the valley of the Spanish Segre (prov. Lerida), contain the highest peaks and the most imposing mountain- masses of the entire system, as Pic de Néthou (in Maladeta), 11,168 feet; Mont Perdu, 10,998; Vignemale, 10,794; Marboré, 10,673; and Pic du Midi, 9466. The summits of the Eastern Pyrenees, which extend eastwards from the Col de la Perche (5390 feet), the second pass over the lofty chain, range between 6500 and 7500 feet (Puigmal, 9545; Canigou, 9138); and, although the altitude decreases as they approach the Mediterranean, they still reach 2100 feet in the Alberes close to the sea. This portion is crossed by the old Roman road from Figueras to Perpignan used by the railway to form the line between the same two towns. The frontier between France and Spain coincides generally with the line of highest summits in the main chain; the principal exception is that at Maladeta the frontier is carried 800 feet above the frontier. By the new railways Spain the valley of Aran, which geographically belongs to France. On both north and south the mountains sink down to the plains in a series
of terraces, with precipitous faces, the general slope on the Spanish side being somewhat steeper than that on the French side. The valleys cut into the mountain mass on both sides almost directly at right angles, in the form of deep ravines, and with the regularity of the spines of a fish’s backbone, along whose length are cut the calibre-shaped basins, called cirques, or by the native mountaineers oulets (= poits), the sides of which are precipitous and seamed with waterfalls; the most celebrated is the Cirque of Gavarnie, at the head of Gave de Pau, with a waterfall 700 feet high. Of the French streams that have their origin in the mountains, those on the Spanish side are for the most part feeders of the Ebro, whilst the French streams—generally called gaves—feed the Adour, the Garonne, and certain little rivers that reach the Mediterranean. The lower Pyrenean valleys through which these streams flow are in many cases covered with grass or forest, or even vineyards and olive-groves. Snow lies on the highest summits, the snow-line being put at 9200 feet on the south side and at 8900 on the north. A few rivers rise about 2500 feet to within 1500 feet just below the peaks of the Central Pyrenees, but almost wholly on the French side. Vegetation is most developed in the Western division, where the rainfall is heaviest; but, whilst it is there central European in its characteristics, the vegetation of the less humid slopes is similar to that of the Mediterranean coast. The geological nucleus of the range is granite, which comes to the surface in most of the highest peaks. But above the granite lie strata of nearly all subsequent ages, especially Silurian deposits, Cretaceous limestones (limestone and limestones = marly limestone) of the Eocene period. Minerals are not generally abundant, though iron is worked in the French departments of Basses-Pyrénées and Pyrénées-Orientales; coal exists on the Spanish side and lignite on the French. There are numerous mineral springs (several being hot), those of Eaux-Bonnes, Canterets, Eaux-Chaude, Bagneres de Bigorre and de Luchon, and Barèges being the best known. Except the passes already mentioned, the Pyrenees are crossed only by mountain-paths, that none but foot-passengers can use, and they only in the summer; the most remarkable of these is the valley of the west side of Mont Perdu. A great number of caves exists amongst the limestone formations, and in them valuable remains of prehistoric man have been found. See works by Perret (1854), Fréaud (1877), Taine (5th ed., 1893), Camena d’Almeida (1893), and Truitat (1891); guide-books by Geel-Fels, Joanne, and Murray; and Count Henry Russell, Pau, Biarritz, and the Pyrenees (new ed. 1891).

Pyrénées, Basses, a department in the south-west corner of France, between the Landes and Spain, and having the Bay of Biscay on the west. Area, 2946 sq. m.; pop. (1891) 425,027. It is divided into the arrondissements of Pau, Oloron, Ordos, Bayonne, and Mauléon. Chief town, Pau. The department comprises the northern slopes of the Western Pyrenees (3000–9800 feet), offshoots from which divide the department into a number of valleys, traversed by mountain-streams (gaves). The chief are the Gave d’Oloron, and Gave de Pau, and other tributaries of the Adour. The Bidasoa, with which the whole length of the boundary of 1659 was signed, forms the dividing line between France and Spain for a short distance. The high valleys and slopes are generally fertile, and well adapted for the growth of the vine, chestnut, and other fruits. Agriculture is the principal industry; large herds of cattle are raised, and tomato and vegetables are grown in the valleys, and many swine in the forest. Of the numerous mineral springs the most important are those of Biarritz, Eaux-Bonnes, and Eaux-Chaude. The western half of the department is the home of the Basques (q.v.).

Pyrénées, Hautes, a department of France, lying east of Basses-Pyrénées, is a part of the old province of Gascony. As its name implies, it contains the loftiest summits of the Pyrénées (q.v.), and is distinguished from the others by the town of Tarbes, Argeles, and Bagneres de Bigorre; chief town, Tarbes. The principal rivers are the Adour and the Gave de Pau. The climate is generally mild in the plains and sheltered valleys. The well-cultivated and artificially watered lowlands yield good crops of cereals, vegetables, fruits of every kind, including the grape. Cattle, sheep, and swine are reared. Marble and slate are quarried. In this department are the springs of St Sauveur, Bagneres de Bigorre, Barèges, and Cauterets. Area, 1749 sq. m.; pop. (1891) 225,861.

Pyrénées-Orientales, a southern department of France, is bounded on the E. by the Mediterranean and on the W. by the Pyrénées. Area, 1501 sq. m.; pop. (1891) 210,125. It is divided into the three arrondissements of Perpignan, Prades, and Ceret. The chief town is Perpignan. Like the other Pyrenean departments, this one embraces a series of parallel valleys formed by the rivers from the Pyrenean slopes. In the north and east of the department. Agriculture is extensively prosecuted, but vines constitute the wealth of the district, and include the red wines of Rousillon, the white unseated of Rivesaltes, and others. This department takes the front rank as a producer of mineral oil; granite, slate, and stone are quarried. There are mineral springs at Amelie-des-Bains, and elsewhere.

Pyrrthrum, a genus of plants belonging to the natural order Compositae. The species are by some botanists included in the genus Chrysanthemum. Feverfew (q.v.), a native of Britain, is a notable species. A handsome double-flowered variety is cultivated in gardens for ornament; and Golden Feather, so much employed in bordering, &c. in the bedded-out system of flower-gardening, is a yellow-leaved variety. Several other species are to be met with in flower-gardens; but the most ornamental of all is P. roseum, from which has sprung a great variety of beautiful and single flowers of brilliant colours. From the flowers of the P. roseum insect-powder (q.v.) or Persian powder is prepared; and the flowers are exported in large quantities for this purpose from Dalmatia and from the Canaeas region.

Pyrheliometer, a radiative thermometer (for measuring the direct heating effect of the sun’s rays), consisting of a body heated by the sun’s rays and a thermometer. See THERMOMETER.

Pyrites, a name employed by mineralogists to designate a large class of minerals, which are compounds of metals with sulphur, or with arsenic, or with both. They are crystalline, hard, generally brittle, and frequently yellow. The name pyrites originally belonged to the sulphide of iron, known as iron-pyrites or simply pyrite, and was given to it in consequence of its striking fire with steel (Gr. pyr, ‘fire’), so that it was used for kindling powder in the pans of muskets before gun-flints were introduced. Pyrite (iron-pyrites) is commonly of a bright brassy yellow, and is found crystallised in cubes, in which form small crystals of it are abundantly disseminated in some roofing-slates, and very large ones occur in some of the mines of Cornwall; it is also found crystallised in amethyst and topaz, and in other forms, more rarely in opaque four-sided prisms; and it often occurs massive, globular, stalactitic, capillary, or investing
other minerals as an inersatation. Beautiful specimens of globular pyrite are found in the chalk of England. It is a very widely diffused and plentiful mineral, occurring in many different kinds of rock. It is too abundant in many coal-seams, the action of water and air changing it into sulphate of iron, (pyrites), during which change so much heat is evolved that the iron is frequently kindled by it, mines become unworkable, and the progress of the fire can only be stopped, if at all, by building up portions of them to cut off the access of air, or by the admission of a plentiful supply of water. Sulphur, always the pyrites, ought not to be employed for building purposes, as it is prone to oxidation. Sometimes it is changed into sulphate of iron, but when other bases are present in the rock the sulphuric acid often unites with these in preference, leaving the iron of the original sulphide free. The iron then becomes oxysulphide, and appears as dark brown blotches. The presence of pyrite thus leads to corrosion and unsightly staining. The colour of pyrite has often caused it to be mistaken for gold, a mistake which its hardness and comparative lightness enables copper or iron, but it is much employed in the manufacture of sulphuric acid, and sulphur is obtained from it by sublimation. It is also used for the manufacture of alum. A rather unstable variety of iron disulphide of a very pale colour is called Marcasite; it crystallises in orthorhombic forms. Another sulphide of iron known as Pyrosulphite (Fe₂S₃) is magnetic.

Copper Pyrites, also called Yellow Copper and Chalcopyrite, is the most abundant of all the ores of copper, and yields a large proportion (perhaps a third) of the copper used in the world. It is brass-yellow, the colour varying with the amount of copper which it contains, a rich colour indicating much copper, and a pale colour the presence of a comparatively large amount of iron; for this ore is not a sulphide of copper alone, but of copper and iron. It occurs massive and disseminated in rocks of almost every class, and is often found crystallised in octahedrons and tetrahedrons, but generally in very small crystals. It may at once be distinguished from iron pyrites by its severe softness, yielding readily to the knife, and by the green colour of its solution in nitric acid. Before the blowpipe, with borax and soda, it yields a bead of copper.—Cobaltite, an arsenio-sulphide of copper, is a principal ore of cobalt. It is generally of a silver-white colour, and occurs massive, disseminated, or crystallised in cubes, octahedrons, dodecahedrons, and polyhedrons, in schistose rocks. —Nickelit, used as an ore of nickel, is a compound of nickel and arsenic. It is generally found massive, and is of a copper-red colour; hence it is called by the German miners Kupfernickel, because they mistook it for an ore of copper.

Pyritz, a manufacturing town of Pomerania. 25 miles SE. of Stettin by rail; pop. 8062.

Pyrmont. See Waldeck-Pyrmont.

Pyrogallic Acid. See GALLIC ACID, PHOTOGRAPHY.

Pyrogallic Acid, or Wood VINEGAR, a crude commercial form of Acetic Acid (q.v.). It is made by the destructive distillation of wood, and, besides acetic acid, contains tar, cresote, wood naphtha, and other products, which have to be removed if it is required in a very pure state. The best woods for the distiller are ‘hard’ woods, although all will yield it. Oak branches stripped of their bark are cut into short billets, which are placed in cast-iron retorts, and a sufficient heat applied to drive off the volatile constituents and carbonise the wood. This acid is of great use in the arts, especially in making the acetates used by dyers and tanniers, but it is not sufficiently pure, and is very carefully purified and properly diluted with water, used extensively as a substitute for common vinegar in pickling, and even for table use. It is also used in the preservation of fish, giving them a ‘smoked’ flavour.

Pyrometry, the measurement of temperatures beyond the compass of the mercuriul Thermometer (q.v.). The leading methods are oculair, calorimetric, and pyrometric. The eye alone is often sufficiently accurate, and can distinguish dull red, 525° C. (say 95° F.); cherry red, 800° C. (say 1450° F.); orange, 1100° C. (2000° F.); white, 1300° C. (2350° F.); dazzling white, 1500° C. (2700° F.). Of these, the cobalt glass as a means of identifying and more sharply discriminating the temperatures of high colour. Calorimetric: a lump of heated metal is thrown into a known quantity of water; the rise of temperature is measured; the temperature of the heated metal is next calculated from its specific heat, its specific gravity, and the rise of temperature and the quantity of the water. This method admits errors from loss of time and radiation; hence only rough results are attained, comparable with one another, but not numerically reliable. Of pyrometric methods may be named expansion of air, hydrogen or nitrogen (only suited for laboratory purposes, for glass melts, metals become permeable, and porcelain is fragile), or of mercury vapour; dilatation of solids—porcelain, platinum, or iron (Professor J. F. Daniell, 1821)—whose expansions are very small and difficult to measure, as they generally take up a new set or form when alternately heated and cooled; the shrinkage of clay (Wedgewood’s pyrometer) giving variable results; the actual fusion of definite metals, alloys, or enamels whose melting-points have been previously ascertained; the temperature is measured by water made to flow uniformly through a tube partially exposed to the heat to be explored; the speeds of outflow of air through an aperture at the atmosphere and at the furnace temperature (Barns, American Journal of Science, 1839); Siemens’ electric pyrometer, which measures the change in the resistance of platinum wire exposed to the furnace heat; Bequerel’s thermo-electric pyrometer, in which a thermo-electric couple (platinum-palladium) is exposed to the heat. When Le Châtelier’s thermo-electric couple, consisting of platinum and platinum plus ten per cent. of rhodium, is used, the readings of a thermo-electric pyrometer may be consistent with one another.

The whole subject of pyrometry was carefully discussed by M. Le Châtelier before the French Société Technique de l’Industrie du Gaz at its annual meeting in 1889; and a summary of his address will be found in The Gas World, March 15, 1890. See also Poggendorf’s Annalen, vol. xxii.; and for Ericsson’s Solar Pyrometer, see Nature, vol xxx.

Pyrope, a gem, often called Carbumele and Hyacinth by lapidaries, which is nearly allied to garnet. Clean and transparent pyrope of siliceous, lime, and the protoxides of iron, chrome, and manganese, it is always of a deep red colour, and is transparent, or at least translucent. It generally occurs in rounded grains, but rarely in imperfectly cubic crystals. It is found chiefly in Saxony and Bohemia, also at Elie in Fife (where they are called Elie Rubies).
Pyrophone, also called Flame-organ, is a musical instrument invented about 1873 by Eugene Kastner (1832–82) of Paris, in which the musical tones are produced by flames of hydrogen gas burning in tubes of different sizes and lengths, arranged somewhat as in an ordinary organ.

Pyrophorns (from the Gr. πυρ, 'fire,' and φως, 'phoro,' I bear') is a term applied to any substance which burns first and rapidly with the rapidity with which they are oxidised. If iron, coal, or nickel be reduced by hydrogen from its oxide at a low red heat, it is obtained in a state of such extreme division as to become incandescent by the oxidising action of the atmosphere; and the tendency to rapid oxidation is much the inferior in the case of some infusible matter, as a little alumina or magnesia, between the particles of the oxide. This is probably due to the cohesion of the minute particles of the reduced metal being thus mechanically prevented, and the access of air to the surface of each particle being thus facilitated. If tartar of lead be heated in a tube till the organic portion becomes charred, the metallic lead is reduced to a state of extreme subdivision, and usually takes fire when poured into the air. If finely-powdered sulphate of bismuth be mixed with half as much nitro-glycerine, black, and heated in a covered crucible, the sulphate is reduced to sulphide of potassium, which remains in a finely-divided state, mixed with the excess of carbon, and takes fire spontaneously in the air from the rapid absorption of oxygen. These are amongst the earliest pyrophors.

Pyrosis. See Indigestion.

Pyrosoma, a genus of compound or colonial Tunicates, sometimes called 'fire-flames' on account of their brilliant phosphorescence. The colonies are hollow cylinders, open at one end, and the walls are formed of hundreds of individuals. These have inhaled apertures on the exterior, while their exhalent apertures open into the cavity of the cylinder, thus producing a gentle current, by means of which the colony is slowly propelled through the water with the closed end foremost. Several species occur in the warmer seas, and P. giganteum is from 2 to 3 feet long. See ASCIDIANS, PYROTECHNY.

Pyrotechny, the art of making fireworks, is of unknown antiquity. It was practised amongst the Chinese from very early times, and has attained with them so much perfection that the beauty and ingenuity of their devices have often been admired by Europeans. Fireworks, as the name is now understood, consist of an inclosed case of combustible material, usually but not always known in Europe until the nature of gunpowder became known, and for a long time only very simple pyrotechnic contrivances were used. The compositions employed for most kinds of fireworks are of the nature of gunpowder. That is to say, the mixture of which they are composed contain combustible or oxidizable substances, along with bodies available for their rapid combustion, since these latter contain large quantities of oxygen.

The most frequently employed combustible materials are carbon (charcoal) or some compound of carbon, such as sugar, gum, and sulphur; or a compound of this element, such as sulphide of antimony. Such bodies as charcoal and sulphur burn slowly in common air, because its oxygen is largely mixed with nitrogen, which does not support combustion; but when they are compounded with nitrates and chlorates the store of oxygen in these salts being given off by heat enables the firework composition to burn at a more or less rapid rate whenever a spark is applied to it. It is not desirable, however, to have too sudden a union of combustible matter with oxygen, hence violent explosions, like nitro-glycerine, are unsuitable for showing coloured or brilliant flames. The two most important oxidising ingredients used in firework compositions are nitrate and chlorate of potash. Iron, in the form of cast-iron or steel, and in a state of fine division, is a frequent ingredient in fireworks, and to some extent the powder or filings of zinc, copper, antimony, and some other metals are also employed. When the particles of these metals are highly heated they produce sparks and scintillations of different colours. A few substances, such as sand and sulphate of potash, are used to modify the rate of combustion.

Variety of colour is much studied in the production of fireworks, as it contributes greatly to their beauty. The colours usually seen are those given by simple metals when burned. Compounds of the metals form part of the mixtures, and these are reduced to the metallic condition in a state of very fine division by contact with the carbon present in the hot mass. A yellow colour is one of the most easily managed, any of the common compounds of sodium producing it. Copper gives a green colour when burned in a hydrogen flame, which changes to blue in the presence of a little free chlorine; so that when copper is used as the oxidising substance containing hydrogen is added, and when employed for blue, calomel (one of the chlorides of mercury) is put into the mixture. Nitrate of barium is also employed for green. Salts of strontium give fine crimson tints, because compounds in which strontium (a very light substance) is present are red. Among the substances used to produce white colours are sulphide of antimony and sulphide of arsenic.

The cases which contain the firework compositions are usually made of paper or pasteboard, or both, pasted in layers. They are usually cylindrical in shape, and the proportion of length to diameter, and the size of openings for the escape of the burning mixtures, are matters of importance. So also is the proper mechanical construction of the fixing of the fireworks. Touch-paper, prepared with a solution of nitrate of potash in alcohol, is used for capping squibs, crackers, and indeed for all kinds of fireworks; quick-match of cotton-wool, which has been saturated with gunpowder, gum, and other ingredients, connects the parts of each design. In the form of pencil-like articles filled with saltpetre, sulphur, and gunpowder, are used to fire the touch-paper cappings.

The simpler kinds of fireworks include squibs, crackers, gerbs, Roman candles, stars, sparks, serpents, thead-foxes, Bongal lights, &c. Squibs are small stout paper tubes filled with grained powder, to which a little charcoal, sulphur, and steel filings are sometimes added, a sufficient quantity of bursting powder being put in to cause a slight explosion at the end when fired. Crackers consist of a tube bent into folds, and containing meal-powder, charcoal, sulphur, saltpetre, and sometimes iron filings in varying proportions. The folds are tied by a cord; and on a cracker being fired a report is given at every turn of the tube. Serpents are tubes, some of which have a choke in the middle. When fired they give a hiss and a hissing noise. Gerbs consist of a straight cylindrical case filled with a composition which produces a bright sparkling jet of fire somewhat in the form of a waterspout. They sometimes contain coloured stars. Roman candles have a reservoir for the powder and the oxygen. In fire-guns the stars are placed at intervals along the tube between layers of the composition. Stars are of different kinds, such as simple stars, tailed stars, and pointed stars. Simple stars consist of saltpetre, sulphur, and fine gunpowder made into a paste-ball with gum and spirits of wine, and dried.
Sometimes they contain iron filings. Many compositions are, however, used for stars, their various colours alone necessitating this. Sparks, or small stars, are also made of different colours. *Marooun* are small boxes, round or square, bound with a cord, and containing a composition which explodes with a light. *Pyrrhos* are still more complicated. The compositions vary according to colour, which are burned in small saccers: for example, a red light can be produced by a mixture of chlorate of potash, nitrate of strontia, sulphur, and lampblack; and a green by chlorate of potash, nitrate of antimony, chlorate of strontia, and lampblack, and nitrate of silver. These *fires* are produced by slow-burning compositions containing some colouring ingredient. They are burned without cases on a fireproof slab; and all substances obnoxious when burned indoors, such as sulphur, antimony, and arsenic, or their compounds, should be omitted in preparing them. Magnesium powder and the minute spores of one or more species of lycopodium are used to imitate lightning in theatres.

The most complicated kind of fireworks are some of the *rocket* kind. These are called wheelers because they have a framework of nave and spokes, round the rim of which cases of the nature of rockets are arranged. They revolve on a pin or metal spindle, and the motion of the rocket is produced, as will be presently explained, by the recoil as the fire escapes, which is considered as connected with each other by levers. There are a number of different forms, but they may be classed under three kinds —vertical, horizontal, and spiral wheels. In the case of the last, a rod (nave) rises vertically from the centre of the horizontal wheel, forming the base, and upon the rod cases are arranged so as to form a spiral. *Pin* or *Catherine wheels* and *pastilles* consist each of a long paper case coiled round a rod in the form of a flat spiral, the case being, of course, filled with a burning composition. *Stars* are either fixed or revolving. Fixed stars are of various designs, but a common kind has a number of cases radiating from a centre, from which jets of fire proceed outwards. By a suitable arrangement the fire is communicated at the same time to the mouths of each of the cases. *Revolving stars* are somewhat similar to spiral wheels with spokes. Of ascending fireworks the *rocket* is the most familiar, and it has been known from an early period. It consists of two parts —viz. a long stick to guide it in its course, and a head. The latter, of strong paper and cylindrical in shape, has its lower portion formed into a hollow cone, base downwards, and round this cone is the burning composition. The object of the cavity is to effect a rapid combustion, which fills it with heated gases, and these, issuing downwards through a small hole in the base, force the rocket up through the air. The upper portion of the head is separated from the lower by a perforated plug of plaster of Paris, through which a fuse passes, so that when the lower portion is burned, the upper, which has a conical head, takes fire and sets off its garniture of stars, saccers, and other ornaments. When fire-arms are discharged there is a recoil, in the case of a heavy gun, of a short distance; in the case of a light cannon, with a larger charge in proportion to its weight, of a much greater distance; and in the case of a rocket in a fixed position, with a light barrel the recoil is great enough to send it high in the air. The motion of a fire-wheel is explained in the same way, there being a recoil caused by the backward pressure of the heated gases on the atmosphere as each case on the ring of the wheel is burned, and the gases escape or ascend at the same time. Upward motion is given by the fire escaping from holes on the under side of the cylinder, and rotatory motion by its finding vent from holes at the ends, but on opposite sides.

Aquatic fireworks, in which the devices which come in contact with the water require to be protected with grease or oil, consist of skimmers or water-devils, floating Chinese trees, gerbs, and Roman candles, water-mines, water fire-fountains, &c. Among recent novelties in pyrotechny are firework-pictures of battles, reviews, and other scenes. Of these perhaps the most popular is the enlargement, in lines of fire, of the portrait of an ancient or modern hero whose incendiary or regal gathering has taken place. The displays of fireworks on some occasions of national rejoicings in Great Britain have cost sums approaching or exceeding £30,000. The greatest displays of comparatively recent date have taken place during the visits of foreign sovereigns to the country. See also LIFE-SAVING APPARATUS, ROCKETS, SIGNS; and T. Kentish, *The Pyrotechnist's Treasury: Art of making Fireworks* (2d ed. 1887).

**Pyroxenes**, a group of minerals, comprising both monoclinc and rhombic forms. The monoclinc pyroxenes are silicates of lime, magnesia, and iron, usually all three being present in some, while others contain a larger percentage. The more important monoclinc forms are Augite (q.v.) and Diablage (q.v.), both being constituents of igneous rocks. The rhombic pyroxenes are silicates of iron and magnesium. There are three: Eustatite (q.v.), which contains less than 5 per cent. of ferrous oxide; Bronzite (q.v.), in which the percentage is from 5 to 15; and Hypersthene (q.v.), containing 15 per cent. and upwards. All these are important constituents of igneous rocks.

**Pyroxylic Spirit**, also called *Wood-spirit* and *Wood-naphtha*, is a mixture of acetone, methyl-alcohol, acetate of methyl, &c., obtained by the destructive distillation of wood in the manufacture of Pyrogelious Acid (q.v.). Many of its properties are the same as those of common alcohol; and now, notwithstanding a long opposition from the Revenue Board, its manufacture and importation are regularly allowed. It is of nearly equal value to alcohol in making varnishes, as it dissolves the resins, oils, and other similar substances. It has a peculiar naphtha-like odour, which is inseparable from it, and prevents it also as a potable spirit at present; but it is asserted that some makers produce it almost odourless, and that it sometimes takes the place of common alcohol in the manufacture of coffee perfumes. It is used in making Methylated Spirit (q.v.).

**Pyroxylin**, a name for cotton (q.v.).

**Pyrrhic Dance**, the most famous war-dance of the ancient Greeks, especially the Spartans. The name was said to be derived from Pyrrho, the inventor of the dance. The *Pyrrhic measure* in prosody consisted of two short syllables. See DANCING.

**Pyrrho** (Gr. *Pyrrhôn*), the founder of a school of Greek scepticism, named after him, was a native of Elis, born in the third quarter of the 4th century B.C. A pupil of Anaxarchus, he followed him when he went in the train of Alexander to Asia and India. He lived to be ninety years old. Our knowledge of his system is derived principally from his pupil, Timon, the *Syllograph* (i.e. *writer of syllos, *satiric* poems*); he himself left no writings. Pyrrho taught that we can know nothing of the nature of things, but that the best mental attitude is suspense of judgment, which is called *equinoxia*. His writings were regarded as *alia latae sensus* or *non posse plus ultra* of (philosophical) scepticism; consistent Pyrrhonists were said even to doubt that they doubted.
Pyrrhus, king of Epirus, born about 318 B.C., a Greek warrior, was the son of Ecdices and a distant kinsman of Alexander the Great. After experiencing many vicissitudes of fortune in his youth, he became sole king of Epirus in 295 B.C., and in that year invaded Italy with a large army, by the addition of the western parts of Macedonia. In 281 B.C. a glorious prospect opened up before the eyes of the restless warrior—the conquest of Rome and the western world, which would confer on him a renown equal to that of his Macedonian kinsman; but Pyrrhus's colonists, called the Lower Italy, then at war with the Romans, sent an embassy to Pyrrhus, in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. The king was overjoyed at the proposal, instantly accepted it, and in the beginning of 280 B.C. sailed for Tarentum with 20,000 foot, 3000 horse, 2000 archers, 500 slingers, and a number of elephants. The pleasure-loving Tarentines were far from pleased at the strict measures taken by Pyrrhus to inure them to the hardships of war. The first battle between Pyrrhus and Romans, which was fought on a plain near the town, produced a decided victory for the Greek; the Romans lost, according to the version of the narrative current among the ancients, 86,000 men, including both soldiers and civilians. The Romans, however, were not disheartened by this disaster, and continued to fight for their country. Pyrrhus, on the other hand, was overjoyed at the prospect of defeating a great power, and decided to march against the Roman empire, which he intended to conquer. He crossed the Adriatic, and in the autumn of 276 B.C., landed in Campania, and was met by a Roman army under the command of the consul, Tiberius Sempronius. The two armies met near Cumae, and the battle was fought with great bravery on both sides. The Romans were victorious, and Pyrrhus was compelled to retreat. He then pursued the Romans for a distance of 20 miles, and returned to Rome, where he was received with great honor. He then returned to Epirus, and his name was inscribed on the list of great conquerors. His victory was a great blow to the Romans, and it was a turning point in the history of the Italian peninsula. He then proceeded against Argos, where he met with a defeat, and was compelled to retreat. He then returned to Rome, where he was received with great honor.
Python

to mark a transition from the crude Hylozoism of Thales and the Ionic philosophers to a formal or rational or conceptual contemplation of the world, developed, say, by the Eleatics, and culminating in Plato. Their idea of a quantitative combination of elements to become a complete theory of Greek speculative cosmos, constituting the ground for a deductive ontology. The conception general of a measure or proportion in things is, of course, most pronounced trait in the Greek mind. It is easy thinking is the Pythagoreans doctrine of the elements and the contraries and of combination and of spherical completeness all the essential features of Greek cosmology. The influence of Pythagoreanism and geometrical conceptions over the mind of Plato can hardly be exaggerated. The chief interest of the Pythagoreans doubtless lay in the domain of physics, and their astronomical theories may be said to constitute their capital achievement. If we remember, too, that Pythagoras is perhaps the first Greek thinker who conceived of philosophy as first a life, a life in common, we shall see in this the beginning of the legislative and ethical view of the philosopher's function expressed in the fullest way in Plato's Republic. The ascetic and mystical aspects of Pythagoreanism linked it closely with Platonism in the mind of Christian thinkers in later times. See Neoplatonism.

Python. See Delphi.

Pythian Games. One of the four great national festivals of the Greeks, held in the Cisinean plain, near Delphi (anciently called Pytho), are said to have been instituted by Apollo after vanquishing the snaky Python. The Games were held in his honour every four years. Originally the contests were restricted to singing, with the accompaniment of either-playing; but flute-playing, athletic contests, horse-racing, contests in poetry and art were afterwards introduced, and long continued a distinguishing feature of these games which are believed to have lasted down to nearly the end of the 4th century a.d. The prize was a laurel-wreath and the symbolic palm-branch. Several of Pindar's extant odes relate to victors in the Pythian Games.

Pythias. See Damon.

Python. A name applied to several large serpents, especially of the genus Python, which inhabit tropical Asia, Africa, and Australia, and closely resemble both in structure and habit the Ious of the New World. The body is rarely 20 feet in length, usually indeed nearer 10, though often estimated at 40; it is plump and very muscular; the tail is prehensile, the two rudimentary useless or 'spurs', which have perhaps a sexual function besides being of use in climbing. The pythons usually lurk near water, among the herbage or on an overhanging tree. They seize small mammals, strange and crush them in their coils, and swallow them slowly. They do not cover them with saliva before beginning to swallow them, reports to this effect being inferences from the appearance of the occasionally disgorge prey. After a heavy meal the serpents
are very lethargic. The animals on which the pythons ordinarily feed are seldom larger than a small dog, and though they may seize and overpower animals as large as a goat, to swallow them "horns and all" is absolutely impossible. We must allow for about fifty per cent. of exaggeration in almost all the popular stories about pythons. It is true, however, that the mother reptile coils herself around her pile of eggs and incubates them for about three months. Among the pythons are the following: the Netted Python (P. reticulatus) of the Malay Archipelago, Burma, and Siam; P. molurus, the Adiijter of the Hindus; P. regia, the Royal Rock-snake of West Africa; P. natalensis, sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver. At present the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. Like all the other sacred utensils connected with the administration of the eucharist, it must be blessed either by a bishop, or by a priest delegated by a bishop.

**Pyx**. Trial of the, the annual trial by weight and assay of the gold and silver coins of the United Kingdom issued from the mint during the preceding year. It is so called from the Pyx—i.e. box or chest—in which are deposited specimen coins. Before the coins are weighed into bags at the mint for issue to the public, two pieces are taken out of each 'journey-weight' (180 oz. Troy in the case of gold, and 720 oz. in that of silver coin), one for assay within the mint, the other for the pyx. The latter are sealed up and deposited in the chest or pyx. The trials were formerly held at Westminster at uncertain intervals of several years, the jury being sworn before the Lord Chancellor or an archbishop, and the president once being Prince Rupert, another time Pitt. Now the trial takes place, to use the words of the Coinage Act, 1874, 'at least once in each year in which coins have been issued from the mint,' at Goldsmiths' Hall, and is made by a jury of goldsmiths presided over by the King's or Queen's Remembrancer, who from 1874 to 1886 was Sir Frederick Pollock (cf. his Remembrances, vol. ii. pp. 272-4). The pyx chest, having been brought to the Hall in the custody of officers of the mint, is opened in the presence of the jury, who proceed to examine the coins in regard to their number, weight, and fineness, in accordance with the provisions of an order in council dated the 29th June 1871. The standard weights used, as well as the trial-plates, are produced by an officer of the Board of Trade. The weight of the total bulk is ascertained, as well as that of selected specimen pieces, and assays are taken from a bar formed by melting a number of coins as well as from separate coins. The verdict recording the results of these several trials releases the officers of the mint from their responsibility in regard to the coinage, and affords a public guarantee that the standard of the currency is well maintained. See Assaying, Mint.
These Cadet bedfellows, other which were derived from the native Gaulish, were among the Greeks. Among the Ionian Greeks it was disused as a letter before the middle of the 5th century B.C., keeping its place only as a numeral. It was retained for a while in the Dorian alphabet, lingering longest on the coins of Corinth. On the coins of Syracuse it was replaced by $k$ about 480 B.C. In the Italian alphabet, which was obtained from Greece before the letter was disused, the symbol was appropriated for the favorite Latin sound of the veler guttural $kw$. The letter $q$ is absent from the Anglo-Saxon alphabet, in which the sound was expressed by $ce$, as in even for queen, and esue for quick. It makes its appearance about 1160, and at first was only used for Latin or French words, such as quarter or quarrel. Before the close of the 13th century it was adopted in genuine English words, such as quaff, quell, quick, and queen. In Scotland it replaced $kw$, as in quhate for hwat (what). In English it is always followed by $u$.

Quack Doctors. Medical quackery is a product of all countries and of all ages; it flourished among civilised and uncivilised communities alike, and was as rampant before the Christian era as it is in our own day. At all times it has found a numerous public ready and willing to be gulled, and this not only among the illiterate and vulgar, but even specially among the higher and better educated classes. In many cases royalty itself has set the fashion by lending its patronage to notorious charlatans. An exact definition of what constitutes medical quackery is not easy to give. The term 'quacksalver' is no longer in general use in the 17th century for quack or doctor, seems to be derived from the Dutch kwakzaaver (Ger. quacksaliber), meaning a person who praised loudly his own medicines or methods of cure. The first part of the word is derived from the well-known but unmusical note of the duck, and typifies the hoarse blustering tones in which itinerant medicine vendors are accustomed to laud their wares. The equivalent French term is Charlatan, derived from the Italian ciarlastare, 'to chatter' (Lat. circulari; circulator, 'a pedlar or voulteh'mak')—a name which also indicates their characteristic and persistent loquacity. In more ancient days the loquacity and persistence were verbal; now they are both verbal and literary, as is shown in the deluge of advertisements with which medical quacks flood the world.

Quackery may be taken to include all devices—whether practised by legally qualified medical practitioners or by those who have had no recognised medical training—which tend to deceive the public by disseminating false ideas of disease, or a belief in imaginary ailments, which vanitt certain medicines or methods of treatment, as panaceas or cure-alls, or which attribute to an individual a supernatural or exceptional power of influencing and curing disease. The element of pecuniary gain or of personal vainglory also comes into a definition of quackery, as opposed to the singleness of purpose and devotion to the interests of the patient which are traditionally held to be the guiding principles of the orthodox practitioner of medicine. Perhaps the most amusing description of quacks and their methods has been given by Goldsmith in his Citizen of the World, and it is as true and as trenchant today as it was then. He says: 'Whatever may be the merits of the English in other sciences, they seem peculiarly excellent in the art of healing. There is scarcely a disorder incident to humanity against which they are not possessed with a most infallible antidote. The professors of other arts confess the inevitable intricacies of things, talk with doubt, and decide with hesitation. But doubting is entirely unknown in medicine; the advertising professors here delight in cases of difficulty; be the disorder ever so desperate or radical, you will find numbers in every street, who, by levelling a pill at the part affected, promise a certain cure without loss of time, knowledge of a bedside, or hindrance of business. When I consider the assiduity of this profession there is little wonder it amazes me. They not only in general give their medicines for half value, but use the most persnve monsternences to induce the sick to come and be cured. Sure there must be something divertingly ostentatious in an English patient who refuses so much health upon such easy terms.'

The Sieur de Courval, writing in 1610, gives a lamentable account of the way in which France, Germany, and Italy were overrun with medical quacks in his day. He describes them as being apostates, vagabonds, disgraced clergy, women of loose character, and rascals of all kinds, and says that they are more dangerous to mankind than vultures, for the latter devour only the dead, while the former prey upon the living. Cadet de Gasscourt, classified quack doctors in a whimsical manner in groups, families, and species, of which the following is an abridgment. *Circulatores: Insects, very venomous, of the order of suckers; common everywhere, found in all countries and all latitudes. Their external characters are very varied. Some have brilliant elytra, velvety, and studded with gold; others have them more coarsely formed, dull, not entire, and marked with rents. Their intestines have an enormous capacity, the heart is wanting or very small; they attack man exclusively, their stings being always injurious and sometimes mortal. The sting is sometimes very evident, sometimes quite hidden or little apparent. He divides them into two great groups, the *Circulatores Phanerophyne,* or peripatetic quacks who practise in public, and the *Circulatores Cryptorophyne,* or *Charlatans en Chambre.* The latter are described as 'the charlatan of the aristocracy, of the bourgeoisie, and of those who do not wish to be seen consulting him in public. This honest son of toil is imbued with a sense of his own importance, his language is simple and direct, he speaks with assurance, and is lodged luxuriously. He is often a specialist,' and so on. These two groups are further largely subdivided, and an amusing description given of each species.
The methods of quack doctors have been the same from all time, and consist principally in attracting and sustaining public attention by extraordinary surroundings and behaviour, and in loudly and persistently asseverating the virtues of their nostrums. This is essentially advertising; and while the invention of printing has stimulated the practice, there are few which it has been necessary to suppress than that of the quack doctor, as it at once opened the way to a much wider public. The enormous modern spread of newspaper reading has further been largely turned to the quack to his own advantage, as it opens up a still wider field for the pursuit of his vocation. When once public attention has been caught, the battle is more than half won; patronage, popularity, and success follow almost as a matter of course. Fortunately these are frequently of a very temporary character; but, as quack doctors are essentially a migratory tribe, this drawback troubles them comparatively little. When they return to their old haunts a new crop of dupes is certain to have come up. The success of quacks must be attributed largely to an imperfect knowledge among the general public of what constitutes disease, and to the fact that there is an often imported, faith in the curative power of drugs. There is little popular conception of what is possible or impossible in the way of healing, and thus the most absurd and extravagant statements are received as facts. Their success, however, has a deeper origin—viz., the natural craving of human passions—the desire to preserve life. The strong desire for life, health, and the relief of pain clouds the judgment and causes the chance of relief from any source to be eagerly grasped at. The popular love of the marvellous and mysterious has also been an assistance in pushing the fortunes of many quacks.

Quack medicines, as a rule, form no real additions to our means of treating disease. Almost without exception they are formulas taken from some old or modern pharmacopoeia, or the prescription of some well-known physician, christened with a name calculated to strike the popular fancy, and then pulped and advertised into fame. Such remedies are to be found for every real and imaginary ailment of mankind; but the happy hunting-ground of the quack is more especially in the regions of chronic, but not fatal, disease, such as the multiform rheumatic affections, chronic skin affections, asthma, hysteria, hypochondriasis, 'nervous disorders,' and a host of others. Persons afflicted with such ailments have naturally alternations of good, bad, and indifferent health, and are often very prone to attribute what is simply natural improvement to the action of the remedy last taken. It is such people who certify so confidently and so gratefully to the curative powers of quack medicines. Cures for cancer, sterility, and consumption, various elixirs of life and youth, and单 antidotes efficacious against all poisons must alone have made the fortunes of many thousands of quack doctors. The sad part of the whole matter is that mankind never seems to learn by experience; no new methods of deception are employed, and no real organized enterprise is ever shown by quacks; they rely upon exactly the same old artifices as their predecessors did, and generation after generation are duped by them just as surely.

Quadragesima (Lat. quadragesima, 'a fourth part'), literally the fourth part of time, or 90°, but signifying, in Astronomy, an instrument used for the determination of angular measurements. The quadrant consisted of a limb or arc of a circle equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. Herat was the first who applied telescopic sights to this instrument. Quadrants were adjusted in the same way as the mural circle. Various innate defects of the quadrant—such as the impossibility of securing exactness of the whole are, concentricity of the centre of motion with the centre of rotation, and perhaps also by carelessness—led to its being superseded by the repeating circle, otherwise called the Mural Circle (q.v.). Hadley's Quadrant is more properly an octant, as its limb is only the eighth part of a circle, though it measures an arc of 90°. Its principle is that of the Sextant (q.v.).

Quadrature. The 'quadrature' of a plane curve is effected when a square is found which has the same area as the given curve. Practically it is effected when any rectilinear figure of equal area has been found for it. There is thus an equivalent square which has been obtained by the process of finding the area of the curve in terms of any square unit. The great problem in quadrature has been the Quadrature of the Circle. The workers in this subject may be divided broadly into two classes: (1) trained mathematicians, who clearly understand the nature of the problem and the difficulties which surround it; and (2) those who do not understand the nature of the problem or its difficulties, and who think that they may, by good fortune, succeed where others have failed. Most of the workers of the second class became greatly diminished when the search for 'perpetual motion' became general. And, at the present day, the ranks (now fortunately small) of the perpetual-motionists and the circle-squarers are almost entirely composed of unfortunate individuals whose mental capacities are small, in too many cases the impairment of their faculties having been brought about by a development of their fruitless idea into monomania. Apart from its great historical interest to the mathematician, the subject serves also as a detailed model of such theories may be useful in preventing further waste of mental energy by some who, were their energies properly directed, might succeed in increasing the sum of useful knowledge.

The nature of the problem may be understood from the following brief account. Let an equiangular n-gon be inscribed in a circle, and let its corners be joined to each other and to the centre. The area of each triangle so formed is $\frac{\pi}{2} \sin \frac{\theta}{n}$, where $n$ is the base of the triangle, $r$ is the radius of the circle, and $\theta$ is one of the angles of the triangle. The area of the polygon is $\frac{n}{2} \sin \frac{\theta}{n} r^2$; and this can be made as nearly equal to the area of the circle as we please by making $r$ sufficiently large. In the limit, when $n$ is infinite, the two areas are equal. But, when $n$ is infinite, $\theta$ vanishes and $\sin \theta$ becomes $\theta$; therefore the area of the circle is $\frac{\pi}{2} r^2$, or $\frac{\pi}{4} (r^2)^2$; that is to say, it is equal to the area of a triangle erected on the radius of the circle as base and of height equal to the circumference of the circle.

The arithmetical quadrature of the circle would therefore be effected if we could find the value of the ratio of the circumference to the diameter—that is, the value of $\pi$ in the equation $\pi = 2\pi r$. The geometrical quadrature would be effected by finding a geometrical method of drawing a straight line equal in length to the circumference.
It has long been known that the arithmetical solution of the problem is impossible, for it has been proved that the quantity \( \pi \) is incommensurable. And proofs have been advanced that the geometrical quadrature is also impossible; but these proofs are by no means simple, and do not always convince those who are able to judge of their accuracy. Still, apart from such proofs, the mere consideration of the fact that (discounting inanimate workers) the question has been fruitlessly attacked by the ablest mathematicians of past centuries should be sufficient to deter any reasonable man from attempting the solution.

It follows that the probability of a solution being possible is excessively small—too small to justify the staking of a man’s sanity, or at least the uselessness of his life, upon the result. Any mathematician who now consents the question seeks not for a solution, but for a simple and convincing proof that a solution is impossible. (It must be remembered that a ‘geometrical’ solution means a solution which involves no more postulates than those of Euclid.)

In 1655, by geometry, in 1698, gave a proof of the impossibility of the geometrical quadrature which Huygens, although he at first objected to it, finally admitted in so far as it applied to any sector of a circle. Newton also gave a proof of this limited problem, but his proof is not conclusive.

Against Huygens, it is true, he has made the practical measurement of the quantity \( \pi \). By a consideration of the inscribed and circumscribed 96-gons he proved that it lies between 3\( \frac{1}{8} \) and 3\( \frac{1}{4} \). This result is correct only to the second decimal figure, two Huygens himself in 1655, 1667, and 1672. Proclus gives 3\( \frac{141552}{96} \). A great improvement on previous results was made by Peter Metius in the 16th century. His result was correct to the sixth decimal place inclusive; but its correctness was accidental, for he gave two fractions between which the result lay and he thought he had the arithmetical means of the numerators and the denominators in order to obtain his final numerator and denominator—a totally unwarranted method. Vieta gave the result correct to the ninth decimal place inclusive; Adrianus Romanus gave it correct to the fifteen, and Snell introduced considerable improvements in the method, and gave 55 decimal figures. Abraham Sharp gave 75, Machin 100, De Lagny 128, Vega 140. The latter result is only correct to 156 places.

Of this class of problems, the geometrical quadrature, which the result (given to 154 places) is correct to 152 places. In 1846 Dase gave a result with 200 decimals, and, in the following year, Clausen gave 250. In 1851 Shanks gave 315, which were extended by Rutherford to 350; and, shortly afterwards, Shanks gave 527, which has been extended to 607. An interesting experimental method was adopted by R. A. Smith. He tossed a thin rod upon a uniformly planked floor, the length of the rod being three-fifths of the breadth of a plank. If \( t \) the length of the rod, while \( b \) is the breadth of a plank, the probability of a rod intercepted so that \( b/t = \) \( x \) is obtained from the result of 3204 tosses, he found \( \pi = 3.1412 \). The true value to 20 places is 3.14159265358979323846.

Any one who is desirous of a more detailed historical account may consult De Morgan’s article on the subject in his Budget of Paradoxes (1872).

## Method of Quadratures

The name is applied to any arithmetical method of determining the area of a curve. When the exact area is known a square whose area is equal to it can be found—hence the term ‘quadrature.’

It has been shown, under the heading Calculus, that the area of a curve whose equation is \( y = f(x) \) is \( \int_{a}^{b} f(x) \, dx \), and can therefore be found when the integral can be evaluated. Hence the approximate determination of the value of a definite integral is obtainable by the method of quadratures.

Let it be required to find the area bounded by a portion of a curve, the ordinates at its extremities, and the axis. The usual method of procedure is to divide the portion of the axis which is included between the two ordinates into a number of equal parts, and to erect ordinates at the points so obtained. The area is approximately equal to the product of one of the given equal parts into half the sum of the two extreme ordinates together with the sum of all the intermediate ordinates. This approximate result by this process the number of equidistant ordinates must be so great that the portions of the curve which are intercepted by successive ordinates are very nearly straight.

A better method, due to Simpson, consists in drawing, through the first, second, and third points obtained as above on the curve, a parabola whose axis is parallel to the ordinates, and repeating this process with the third, fourth, and fifth points, and so on—till the points being chosen so that the total number of ordinates is even. The result of this given curve will be approximately equal to the sum of the areas of the various portions of the parabolas included between successive ordinates when these ordinates are sufficiently close together. It is therefore approximately equal to one-third of the sum of all the odd intermediate ordinates and four times the sum of all the even intermediate ordinates.

When the successive equidistant ordinates are very close together, the area is approximately equal to the product of the common intercept on the axis between successive ordinates into the sum of all the ordinates. The labour involved in the estimation of an area by this process would be fatal to its employment unless the number of ordinates was small. But, if the ordinates were few in number, considerable error would in general result unless a correction could be applied. This method is adopted in that process which is known as the method of quadratures par excellence, and which is as follows: Let \( y_0 \) be the several equidistant ordinates, and let \( a \) be the intercept on the axis between \( y_0 \) and \( y_n \). Also let \( x \) be the sum above referred to; and let \( y_0 = y_1 = \ldots \), \( y_n = y_{n+1} = \ldots \), \( a_0 = a_1 = \ldots \), \( a_n = a_{n+1} = \ldots \), \( y_1 - y_0 = y_2 - y_1 = \ldots \), \( y_n - y_{n-1} = \ldots \), and so on. The value of the whole area is (not \( a \), but)

\[
x = \frac{1}{6} \left( y_0 + y_n \right) - \frac{1}{4} \left( y_1 + y_2 + y_3 + \ldots + y_{n-2} + y_n \right) + \frac{1}{2} \left( y_2 + y_3 + \ldots + y_{n-2} \right) - \frac{1}{3} \left( y_1 + y_3 + \ldots + y_{n-1} \right) + \frac{1}{4} \left( y_2 + y_4 + \ldots + y_{n-2} \right) - \frac{1}{6} \left( y_1 + y_5 + \ldots + y_{n-3} \right) + \frac{1}{2} \left( y_3 + y_5 + \ldots + y_{n-3} \right) - \frac{1}{3} \left( y_2 + y_6 + \ldots + y_{n-4} \right) + \ldots,
\]

It will not in general be necessary to proceed beyond the fifth difference. As an example we shall find the area of the curve \( y = x^2 \) between the limits \( x = 10 \) and \( x = 15 \). In this case all differences beyond the third vanish, and \( a = 0.5 \) if we make eleven ordinates in all. The following table represents the results:

</table>
Hence we have $z = 22515\times 0.5 - 11257\times 0.25$; 
$\frac{1}{2} \times 0.5 \times (y_1 + y_2) = 1003.75$; 
$\frac{1}{2} \times 0.5 \times (\Delta y_1 - \Delta y_2) = 0.61456$; 
$\frac{1}{2} \times 0.5 \times (\Delta y_1 + \Delta y_2) = 0.75193$. 
We therefore get by this method, approximately, for the value of the area the quantity $10156.25$. The correct value is 10156.25, and so the error is less than one in twenty thousand.

This method is of extreme utility in the evaluation of definite integrals when rigorous processes are not attainable.

**Quadrill.**

Quadrilateral, the name given in history to the four fortresses of North Italy—Mantua, Verona, Peschiera, and Legnago—which form a sort of outwork to the bastion of the mountains of the Tyrol, and divide the north plain of the Po into two sections by a most powerful barrier. They have figured in all the later wars that have been fought in North Italy, especially in the wars between Austria and the different Italian states—Russia has a similar combination of four fortresses in Poland, called the Polish Quadrilateral. See Novogrjegevs.

**Quadrilla.** A dance of French origin, introduced about 1686 into England. It consists of consecutive dance movements, generally five in number, danced by four or more couples, opposite to, or at right angles to, each other. See DANCING.

**Quadrille.** A game at cards, very fashionable about two centuries ago. It is very similar to the Spanish game of Ombre (q.v.), with the necessary alterations to fit it for a four-handed game. When whist came into fashion after 1740, quadrille began to lose favour.

**Quadrup.** The offspring of a mulatto and a white person; the name indicates a man or woman who is 'quarter-blooded.'

**Quadruman.** (Lat., 'four-handed'), in the zoological system of Cuvier an order of Mammalia, which he placed next Bimana, and which contained the animals most nearly resembling man in their form and anatomical character—viz. the monkey andlemur families. See Anthropoid Apes, Mammals, Monkeys.

**Quadruple Alliance.** A league formed August 1718 between England, France, Austria, and Holland to counteract the ambitious schemes of Alberoni. It was made upon the basis of the Triple Alliance which was formed in the January of 1717 between England, Holland, and France, and by which the clauses in the treaty of Utrecht having reference to the accession of the House of Hanover in England, the renunciation by the Spanish king of his claims on the French throne, and the accession of the House of Orleans to the French throne should the young king, Louis XV., die without issue, were guaranteed. The Spanish fleet was destroyed by Ryng off Cape Passaro, while the French crossed the Pyrenees and inflicted several defeats upon the Spaniards; and at length Philip was compelled to dismiss his ambitions minister, and accept the terms of the Quadruple Alliance, January 19, 1720.

**Questor** was anciently the title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the kings. The oldest questor was the questores parricidi ('investigators of murder,' ultimately public accusers), who were two in number. Their office was to conduct the prosecution of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B.C., when their functions were transferred to the Triumvirii Capitales. But a far more important though later magistracy was the orders classicis, to whom was entrusted the charge of the public treasury. They appear to have derived the epithet of classicis from their having been originally elected by the centuries. At first they were only two in number, but in 421 B.C. two more were added. Shortly after the breaking out of the first Punic war the number was increased to eight; and as province after province was added to the Roman Republic they amounted in the time of Sulla to twenty, and in the time of Cæsar to forty. On its first institution the questorship (questorship) was open only to patricians; but after 421 B.C. plebeians also became eligible.

**Quagga** (Equus—or Asinus—quagga), one of the three species of striped wild horses, or more properly wild asses, peculiar to Africa, of which the zebra is the type. Formerly found in profusion south of the Vaal River, beyond which its range seldom extended, it is believed to be now quite extinct. The illustration represents the last animal of its species owned by the Zoological Society; it was sent from the Cape by Sir George Grey in 1838. The quagga was a handsome animal, more strongly built than the mountain zebra and Burcheil's zebra. The upper parts of the body were dark rufous brown, becoming gradually more fulvous, and fading to white at the rump and ventral surface, the dorsal line dark and broad, widening over the crupper. The head, neck, mane, and shoulders were striped with dark brown, gradually waxing fainter till lost behind the shoulder. It was usually
found in herds of from ten to a hundred, but often in troops of many hundreds on the plains of the Orange Free State and Cape Colony, and often associated with the white-tailed gun, not seldom with ostriches. The quagga was swift and enduring, but could be run down by a first-rate horse. Its extinction was mainly wrought by the Orange Free State and Transvaal Boers, who killed thousands annually for their skins. In the old days it was tamed with success, was more tractable than the zebra, and even bred in captivity. The term Quagga is a corruption of the old Hottentot name Jurela, bestowed in imitation of the ant bear living neigh of this quadruped. The quagga is not to be confounded with Burchell's zebra, which is often erroneously called quagga by hunters of the South African interior.

Quail (Coturnix), an Old-World genus of the Partridge family (Perdidae), ranging over the temperate Paleartic, Ethiopian, and Oriental regions, and in the Australian region to New Zealand. The quails are the smallest of the partridge family. Six species are described in this restricted genus. The best known is the Common Quail (Coturnix communis). In size it is about 14 inches long; the general color is brown, varied with buff, and on the under parts buff. The male is somewhat smaller in size, is brighter, and has a reddish throat and two dark-brown bands descending from the ear-coverts and ending at the throat in a blackish patch acquired at the second year. Quails fly rapidly and take long and fatiguing journeys. Mense flock visit the coun-

dervastation is rapid, for they range the Mediterranean, especially during the spring emigration; and they are accustomed to lay their food in large numbers—17,000 have been brought home in one day, and in the small island of the Bay of Naples, over 160,000 have been caught in a single season. The male is brown, but the majority pass northwards. In England quails are spring visitors; they are becoming scarcer, but at times there is a great influx. Northwards the numbers are fewer, but nests have been found in the northernmost mainland of Scotland, and in the Orkneys, Shetlands, and Outer Hebrides, and in summer they reach the Faroe Islands. A few remain on the south-west coast of England and in Ireland during winter, but the majority leave in October; many pass the winter in the south of Europe and in North Africa; and the species is resident in the Canaries, Madeira, and the Azores. It is also found at the Cape in Madagascar and Mauritius, and in Egypt, while in Palestine, as of old (Exod. xvi. 13), quails come up at night and cover the land. It ranges to India and China, and passes the cold season in those countries. Its flesh is considered delicious, and in the countries they commonly visit the arrival of the quails is eagerly expected. Quails feed chiefly on insects and slugs, but also on grain and seeds, and they seek their food in the evening. In habit they are unsociable, unamiable, and passionate with their own species. They are partly polygamous, partly monogamous. The

female is, however, an excellent and careful mother. She builds her nest of bits of plant life, but lays from seven to fourteen eggs, pear-shaped, light brown in colour, with dark shading. The young are full grown in six weeks, and two broods may be reared during the season. The call-note of the male is three-syllabled, and from it the quail is known and distinguished. The quail is widely distributed in Barbary and in the Ethiopian, Indian, and Australian regions. Australia possesses a genus, Synoicus, peculiar to itself, which includes four species. The American Quails, of which there are about sixty or forty species, are found in the family or sub-family Odontophoridae, and differ in habit from all the Old-World forms in perching upon trees. The Virginian Quail (Ortzy virginianus), known as the Partridge and the Bob-white, from its calling-note, and the Californian Quail (Laportea California), is found in Texas, is seldom introduced into England as game-birds, but they have not yet become resident there.

Quain, a family of eminent medical men. (1) JONES Quain, born in November 1796, at Mallow in Ireland, studied medicine at Dublin and Paris, and in 1829 was appointed professor of Anatomy and Physiology in the Aldersgate School of Medicine, London. Two years later he was made professor of Anatomy and Physiology at London University, and held that post until 1836. He died in London on 27th January 1865. That well-known students' text-book, Quain's Elements of Anatomy, was originally written by him; the first edition appeared in 1828, the tenth in 1890. Jones Quain published also a series of elaborate Anatomical Plates (1858) and a translation of Martinet's Pathology (1835).—(2) RICHARD Quain, brother of the above, was born at Fermoy, Ireland, in July 1800, studied at London, and was appointed professor of Anatomy and Clinical Surgery in University College, London, in 1837. He was likewise appointed surgeon-extraordinary to the Queen, and was elected president of the Royal College of Surgeons in 1848. He died in London on 15th September 1887. Amongst his works the principal are Anatomy of Arteries, with folio plates (1845), Diseases of the Rectum (1854), Observations on Medical Education (1865), Some Defects of Medical Education (1870), and articles on Dialogetions of the Hip and the Knee, he edited along with others the fifth edition of (Jones) Quain's Anatomy. By his will he left nearly £75,000 to University College, London, for the education in modern languages (especially English) and in natural science of two students each year. Richard Quain's first cousin to both the above, was born at Mallow on 30th October 1816. He was Lumleian lecturer at the Royal College of Physicians (Diseases of the Muscular Walls of the Heart) in 1872, and Harveian Orator, The Younger (Atoni, or Prophetic Aspects) in 1883, and was made physician-extraordinary to the Queen. He edited the Dictionary of Medicine (1882; 2d edition, 1894), and contributed to the Trans. of the Med. and Chirurg. Soc., the London Jour. of Medicine, &c. Dr Quain was made LL.D. of Edinburgh in 1889, president of the General Medical Council in 1891,
was created a baronet in 1601, and died 13th March 1608.—(4) Sir John Richard Quain, born at Mallow in 1817, the half-brother of James and William, was appointed judge of the Court of Queen's Bench in 1872, and justice of the High Court of Judicature in 1875. He died 12th September 1876. Along with H. Holroyd he published The New System of Common Law Procedure (1852).

Quakers. See FRIENDS.

Quantification of the Predicate, a phrase belonging to Logic, and introduced by Sir W. Hamilton, according to which all Syllogism Logical propositions are divided, according to their quality, into affirmative and negative, and, according to their Quantity, into universal and particular ('All men are mortal,' 'Some men live eighty years'). If we combine the two divisions we obtain four kinds of propositions. Sir W. Hamilton affirmed that the statement of the Quantity of these various propositions is left incomplete; only the subject of each has its quantity expressed ('all men, some men, no men'); while there is implied or understood in every case a certain Quantity of the predicate. Thus, 'All men are mortal,' is not fully stated; the meaning is, that all men are a part of mortal things, there being (possibly and probably) other mortal things besides men. Let this meaning be expressed, and we have a complete proposition to this effect: 'All men are a part of (mortal) mortals,' where quantity is assigned, not only to the subject, but also to the predicate. The first result of stating the quantity of the predicate is to give eight kinds of propositions instead of four; the next result is to modify the process called the Conversion of Propositions, Resolution (All A is B, some B is A) is resolved into simple conversion, or mere transposition of premises without further change. 'All A is some B,' 'Some B is all A.'

The multiplicity of variations in propositions is attended with the further consequence of greatly increasing the number of syllogismim, or forms of deductive reasoning (see SYLLOGISM). In the scholastic logic, as usually expounded, there are nineteen such forms, distributed under four figures (four in the first, four in the second, six in the third, five in the fourth). By ringing the changes on the same number of premises, the number of the old number, four, thirty-six valid syllogism can be formed in the first figure. Whether the increase serves any practical object is another question. Sir W. Hamilton also considered that the new system led to a simplification of the fundamental laws of the syllogism.

Professor De Morgan also invented and carried out into great detail a plan of expressing the quantity of the predicate. It should be noted that in the Contemporary Review of 1873 Professor Jevons, following Mr Herbert Spencer, recognised the fact the discovery of the quantification of the predicate, regarded by him as the most fruitful discovery in abstract logical science since the time of Aristotle, was fully contained in George Bentham's Outlines of a New System of Logic. This work was in 1827, and reviewed by W. Hamilton in the Edinburgh Review, long ere he himself published anything on the doctrine of quantification. Boole's system of logic was based on his doctrine of quantification of the predicate. See Jevons's Logic; Bowen's Treatise on Logic (Cambridge, 1860).

Quackocks. See SOMERSETSHIRE.

Quarantine (from the Fr. quarantaine, a period of forty days) is a forced abstinence from communication with the shore which ships are compelled to undergo when they are last from some port or country where certain diseases held to be infectious, as yellow fever, plague, or cholera, or are supposed to have been so. Where a quarantine is established (1603) it is a punishment of the fine prescribes. Any person in the suspected ship to come on shore for any one to disembark any merchandise or goods from her, except at lazarettas, which are establishments provided for the reception of goods or passengers or crew, and where such purifying processes as the sanitary science of the time prescribes are applied. Prolonged quarantine in bad quarters is apt to produce new diseases in typhus, &c. Until a ship is discharged from quarantine she exhibits a yellow flag at the mainmasthead if she has a clean bill of health, and a yellow flag with a black ball if not clean; a black flag is exhibited at the same place. The permit to hold intercourse after performing quarantine is called Pratique. Quarantine is not of necessity limited to a land frontier; and it is enforced at the frontiers between contiguous states. History describes quarantine regulations for maritime intercourse to have been first established by the Venetians in 1197 A.D.; but the practice must have been greatly older on land-frontiers; and the precautions of the Jews against leprosy indicate that a species of quarantine was enforced by them. The tossing, or an unquantifying quarantine was enforced in 1624. The law of 6 Geo. IV. chap. 78, amended by 29, 30 Vict. chap. 90; power to proclaim any place subject to quarantine and prescribe regulations being vested in the Privy-council. See BILL OF HEALTH.

Quarles, Francis, a minor religious poet, belonged to a good Essex family, and was born at the manor-house of Stewards near Romford in 1592, being baptised on 5th May. He studied at Christ's College, Cambridge, and at Lincoln's Inn, and was successively cup-bearer to the Princess Elizabeth, secretary to the famous Archbishop Ussher, and, like Middleton and Ben Jonson, Chronicler to the city of London (1639). He married in 1618 a wife who bore him eighteen children, and penned shortly after his death a touching short memoir, prefixed to Solomon's Recantation (1645). Quarles was a bigoted royalist and churchman, suffered losses and calumny in the cause, and died 8th September 1644. His works were of various kind, some in prose, and his books were extraordinarily popular in their day. Nor are his Divine Emblems and Enchiridion entirely unworthy of their reputation. Pope's lines in the Dunciad are familiar to everyone:

Or where the picture for the page stone,
And Quarles is saved for beauties not his own.

But the clever gibe is not entirely justifiable, for the Emblems, in spite of verbose and dull if edifying moralising, helpless bad taste, not infrequent lubes, and ever present monotonous, shows wealth of fancy, excellent good sense, felicity of expression, and occasionally a bright though intermittent flash of the poetical. A collection of short essays and meditations, affords many an example of compact and nothaphoric prose, while its antithesis and word-play are often effective and sometimes fine.

His poetical works include A Feast for Women (1620);
Hudibras, a History of Queen Elizabeth (1621); Aegyptus and Persia; his only long poem not directly religious (written apparently about 1622; first extant ed. 1629); Sions Elephants ned by Jeremi the Prophet (1624); Job Miliantis (1624); Emblems Sacri in Britain Solomon the Wise (1625); Divine Poems, a collection containing many poems printed before (1630); The Historie of Sannson (1631); various Elegiac Poems (between 1630 and 1649); Divine Poems, set forth in a New Light in Britain, and Observations (1632); the famous Emblems (1635), to which were added in 1638 Hierogliphica of the Life of Man; Solomon's Recantation (1645); and The Shepherds.
Quartermaster. In the British army the quartermaster-general is a staff-officer of high rank (major-general or colonel) who deals with all questions of supply, transport, marches, quarters, fuel, clothing, &c. He ranks next after the adjutant-general in seniority under the command-in-chief at the War Office, and has under him two assistants and three deputy-assistants. The army in India has a similar staff for these duties, and so has every division; but since 1849 the title of quartermaster-general (British) has been substituted for that of assistant-quartermaster-general on the staff at home. In a brigade the duties fall upon the brigade-major. A quartermaster is an officer on the staff of a depot, a cavalry regiment, or an infantry battalion, charged with the care of stores, issues of clothing, food, forage, and fuel, allotment of barracks, tents, &c. In the native army of India he is a combatant officer of the staff-corps, but in other cases he is commissioned from the ranks as honorary lieutenant, and promoted after ten years' service, or for distinguished conduct, to the honorary rank of captain or major. In the Royal Artillery there are 44 quartermasters, in the Army Service Corps 49, and in the Royal Engineers 120, not counting those in the militia and volunteer regiments. At the War Office and elsewhere, on duties different from those mentioned above; the War Office librarian, for instance, in 1891 being a quartermaster of the Royal Engineers. The daily pay of a quartermaster is 8s. for infantry; 9s. 6d. for garrison artillery and engineer officers, or 10s. 6d. for engineer officers in addition in the latter corps; and 10s. 6d. for mounted troops, rising every five years by increments of 1s. 6d. to 15s., 15s. 6d., and 16s. 6d. respectively. After twenty years' commissioned service, or when fifty-five years of age, a quartermaster is compulsorily retired on a pension of £200 a year, or somewhat less if his total service as a soldier does not amount to thirty years. A quartermaster-sergeant assists the quartermaster in a regiment or battalion.

In the navy the quartermasters are first-class petty officers; at sea they are stationed at the con, their duty being to take care that the helmsmen keep the ship on her proper course, and also to see that all orders from the officer of the watch affecting the movements of the helm are promptly executed and correctly executed; and in sinking the log and in taking soundings when necessary. In harbour they keep regular watch at the gangways, looking out for boats arriving and leaving, and conveying the necessary orders for the carrying out of the work of the ship. Their pay depends upon their rank, $25 for a quartermaster, number of good-conduct badges, &c., and will be found under the heading Petty Officer.

Quartermaster. His 1824, the H.M. quire a deduction, containing only the sixth part of a gallon, and often less. Quartermaster. See Building Stone, Blasting. Quart., the fourth part of a Gallon (q.v.). The ordinary quart-bottle is a deception, containing only the sixth part of a gallon, and often less. Quarternet. See AGUE. Quar-ter, a measure of weight, equal to the fourth part of a hundredweight — i.e. to 28 lb. avoirdupois. As a measure of capacity, for measuring grain, &c., a quarter contains 8 bushels.

Quarter-day. See TERM.

Quarter-deck, that part of the upper deck which extends from the mainmast or gangway amidships to the poop, or where there is no poop, to the stern; in modern turret and barbette war-ships it generally extends from the after-turret or barbette to the stern. It is the place of honour, and is sometimes referred to as the Queen's Park. Each officer and man stepping upon it salutes it, as a mark of respect to the majesty of the throne. 'H.M. quarter-deck' is used as a promenade by officers only, at sea the weather side, and in harbour the weather side of the senior officers. Persons of distinction and officers are received on the quarter-deck; and when the captain addresses the men, or confers rewards or honours on any individual, it is on the quarter-deck that the officers and men fall in for the purpose.

Quartering. See HERALDRY; also EXECUTION, TREASON.

Quarterly Review. John Murray, conscious of the growing power and influence of the Edinburgh Review, and strongly disapproving of its Whig opinions, set about the organisation of a work which should counteract what he believed to be its dangerous tendencies. Accordingly, in September 1807, he wrote to Canning with a view to securing the services of some of the greatest talents and importance.' Though Canning does not seem to have replied directly, his cousin, Mr. Stratford Canning, introduced Gifford (q.v.) to Murray in January 1808, and arrangements were afterwards made whereby he became its first editor. Murray took Gifford with him, and with which work he was occupied, he reviewed on Murray the Edinburgh (1808) that Scott's feelings as a gentleman and a Tory must be wounded, and that he would break his alliance with the whole Whig clique. He judged truly, and in a conference with him at Ashleiesteet, in October 1808, he secured his assistance and co-operation. Scott not only wrote to his brother Thomas, C. K. Sharpe, Morritt, and Southey, on behalf of the first number, but sent a letter of advice to Gifford, and became himself a considerable contributor. The first number, rather more literary than political in tone, appeared at the end of February 1809. A second edition of 4000 was sold at once, of which 500 went to Ballantyne in Edinburgh. The publisher bravely persevered, though up to the fifth number not one had paid its expenses, and though £5000 of capital was embarked in it. The undertaking was a success, 14,000 being printed, and Southey, who was its 'sheep anchor,' wrote that 'Murray is a happy fellow living in the light of his own glory.' Great drawbacks were Gifford's unpopularity, and occasional ill-health. Only two numbers appeared in 1809, due in January, in August; and No. 61, due in April, in December. Gifford, resigning the editorship in 1824, was succeeded by John T. Coleridge, who edited only four numbers; his successor was John Gibson Lockhart (q.v.). Murray's original offer to Gifford as editor was 100 guineas a number for contributions, and £200 a year as editor; when he invited Lockhart to London his offer was £1000 a year, which could be made £2000 by contributions. In seven years, the profits of which would not be worth less than £1500 per annum. Besides Scott and Southey, George Ellis, Heber, Barrow, Croker, and Captain Head were considerable contributors. Croker had 89 articles in Murray's number. A frequence rate of payment to Scott and Southey was £100 per article. The fashion of the times, and the lighter monthlies, have told against the Quarterly, which still commands, however, the best ability and scholarship in England. See Smiles, A Publisher and his Friends (2 vols. 1891), and articles BOOK-TRADE, MURRAY (JOHN), and PERIODICALS.
Quartenn is a term employed in some parts of Great Britain to designate the fourth part of a peck; in liquid measure it is the fourth part of a pint, and so synonymous with the imperial gill. A quartenn loaf generally weighs 4 lb.

Quarter Sessions, a county court; Justices of the Peace were established in 1530-51, and meeting once a quarter. Most of their administrative duties were in 1888 transferred to the County Councils (see County).

Quarterstaff, once a favourite weapon with the English for hand-to-hand encounters, and still sometimes used in athletic exercises, is a stick, of wood, iron, or about 6 ft. long, often bound with iron at both ends. It is grasped in the middle by one hand, the other holding halfway between the middle and end (hence apparently the name ‘quarter-staff’); and the attack is made by giving it a rapid circular motion, which is the loaded ends on the adversary at unexpectcd points. See Broadsword and Singleton, by Allanson-Winn and Philippi-Wolley (1890).

Quartet, a piece of music arranged for four solo voices or instruments, in which all the parts are obligato—i.e. no one can be omitted without incurring the effect of the disposition. More intercalation of melody, by which the parts become in turn principal and subordinate, without any interweaving of them, does not constitute a quartet. Quartets for stringed instruments are generally arranged for two violins, viola, and violoncello, and are known by sonata form. They originated with Haydn, and were further developed by Mozart, and notably by Beethoven, who perfected the art of part-writing. Subsequent writers are Schubert, Spohr, Mendelssohn, Schumann, and Brahms. Vocal quartets are a frequent feature in oratorio, oratorio, and up to the time of the meeting of Wagner.

Quartodecimus. See EASTER.

Quartz, a mineral composed of silica, SiO₂. It is met with chemically pure, but not infrequently contains variable proportions of ferric oxide, manganese oxides, alumina, magnesia, lime, organic matter, &c. Very often it shows inclusions, microscopic or macroscopic as the case may be, that render it difficult to distinguish from cavities. It occurs both in crystals and massive, the more common crystals being hexagonal prisms terminated by hexagonal pyramids. Double hexagonal pyramids are also not uncommon. It scratches glass easily, and becomes positively electrical by friction. Fine inclusions are mere tremulous giving luminescent in the dark. Quartz when pure is colourless, but, owing to the presence of foreign substances, many coloured varieties are known. Three types of quartz are recognised: (1) Rock-crystal, (2) Common Quartz, and (3) Compact Quartz.

Rock-crystal.—Under this head are included the varieties which are more or less transparent and assume well-marked crystalline forms. The water-clear crystals are known as Rock-crystal. The crystals are sometimes slender, crossing and penetrating each other in exquisite groups. They frequently enclose other substances, which are beautifully seen through the transparent rock-crystal, as slender hair-like or needle-like crystals of hornblende, asbestos, oxide of iron, rutile or oxide of titanium, oxide of manganese, &c., and small specks of various fanciful names, as Thetis’ Hair-stone, Venus’ Hair-stone, Venus’ Pensée, Cupid’s Net, Cupid’s Arrows, &c.; and sometimes the enclosed substances are small spangles of iron-glance, or crystals of iron pyrites, or native silver in fern-like leaves, or spangles of gold. Rock-crystals are found in large quantities in the quartz of Poreta. Very large crystals of perfectly pure rock-crystal are sometimes found.

One from the Alps, which was among the treasures carried from Italy by the French in 1797, is 3 feet in length, about 1½ feet in diameter, and weighs 7 cwt. Similar giant crystals are obtained in Madras. Rock-crystal was once used as a substitute for topaz and was used by them, as it still is, for vases, cups, seals, &c. An important modern use of it is for lenses of spectacles, &c., its hardness rendering it much less liable to be scratched than glass. Lenses of rock-crystal are often called Pebble lenses. Rock-crystal is best developed in the crevices and cavities of crystalline schistose and granitoid rocks, such as those of Tyrol and the Alps, where it is associated with felspar, titanite, rutilc, mica, chlorite, and other crystallised minerals. Smoky Quartz, smoky-brown; Caurin- quartz, smoky-yellow; and Morion, blue, are varieties the colours of which have been variously attributed to the presence of small quantities of oxide of iron or manganese, or titan acid or organic substance. Yellow and pellucid varieties of rock-crystal are known as False Topaz. Amethyst (q.v.) is a purple kind of quartz; and Rutile Quartz is purple or violet, the darker shades are often highly prized; sometimes speckled varieties of this beautiful mineral occur. When subjected to heat amethyst loses its violet colour and becomes yellow. The Gold Topaz and Citrine of jewellers are in most cases amethysts which have been treated in this manner.

Common Quartz includes non-transparent varieties, some of which, however, are more or less translucent. They are either white, colourless, or coloured, the tints being generally pale, but many show intense shades of red, green, yellow, brown, &c. Sometimes they assume crystalline forms, at other times they have a granular or massive structure. The following are varieties: Milk-quartz, milk-white and slightly opaque (Greenland, &c.); Grassy Quartz, like milk-quartz, but with a greenish lustre; Rose-quartz, rose-red, sometimes crimson, the color fading on exposure (Bodemenai); Siderite or Sapphire-quartz, indigo or blue in colour, from the presence of asbestos-like fibres of blue crocidolite (Golling in Salzburg); Ferruginous Quartz, coloured red with ferric oxide or brown with hydrons ferric oxide; Prase, leek and other varieties; the oxide of titanium and mica, Quartz containing the quartz whithish or coloured eectric radiations (Bohemia); Fibrous Quartz, brown, with a silky lustre, pseudomorphous after crocidolite (Cape of Good Hope); Quartz-pyrite is an olive-green aggregate of quartz and pyrite (Saxony, &c.); Star-quartz, containing within the crystal whitish or coloured eccentric radiations (Bohemia); Fibrous Quartz, brown, with a silky lustre, pseudomorphous after crocidolite (Cape of Good Hope); Quartz-pyrite is an olive-green aggregate of quartz and pyrite (Saxony, &c.); Floatstone, porous, cavernous, which floats in water until the air in its numerous cavities becomes displaced (Cornwall, &c.); Cat’s-eye, yellow or greenish, exhibits opalescence, but without prismatic colours, an affect due to fibres of asbestos or minute tubes arranged in parallel directions (Ceylon, Harz, Fichtelgebirge, &c.).

Compact Quartz embraces compact and also finely granular aggregates, which are only translucent on their edges. Varieties are Hornstone, grey, brown, yellow, or red, common in many countries; Chrysozoa, a hornstone coloured green with nickel (Silesia); Aventurine (q.v.), a somewhat granular hornstone, spangled with scales of mica or goethite (Alta Mountains); Jasper (q.v.), brown, yellow, red, very impure, with a considerable percentage of iron.

Among the synthetic minerals which are included in the quartz family are the chalcedonies. These are mixtures of crystalline and amorphous silica. Chalcedony (q.v.) itself is colourless or pale gray, or pale bluish or yellowish, translucent to semitransparent. It is often seen in mammillari, botryoidal, or stalactic forms. The following are chalcedonies: Carnelian,
clear red and sometimes yellowish; Plasma, green; Heliotrope or Bloodstone (q.v.), green with red spots. Chalcedony is a dull milk-white and sometimes porphyritic rock, but is regarded by some mineralogists as a variety of Opal. *Mass-agate* is a colourless chalcedony, containing brown moss-like dendritic inclusions. Agate (q.v.) consists of alternate layers of chalcedony and other varieties of crystalline and amorphous silica. *Onyx* is a highly polished layer of black or brown and white chalcedony; while in Sardonyx, which has a similar structure, the alternate layers are red and white. For amorphous forms of silica which contain variable quantities of water, see Opal.

Quartz is the most abundant and widely diffused of all rock-forming minerals. It occurs in many other igneous and schistose rocks it is met with in a less prominent constituent. It occurs also abundantly as a secondary mineral or alteration-product in igneous and schistose rocks generally—sometimes irregularly diffused, at other times occupying crevices, cavities, &c. Many rocks, especially Archean and Palaeozoic, are composed of quartz, which may vary in breadth from mere lines up to many feet. In some places such veins are more or less impregnated with gold—indeed quartz veins may be looked upon as the chief repositories of the precious metal (see Gold).

Quartz, in crystals, is also one of the most common minerals met with lining the walls of metallic lodes. Amongst derivative rocks it plays an important part—conglomerates and sandstones being composed as a rule chiefly of siliceous materials. Chalcedony as a rock constituent is a product of alteration, and is met with commonly in the vessels and pores of many igneous rocks, or as irregular aggregates diffused through their ground-mass. It is also a common vein-mineral—the coloured chalcedonies especially occurring in this form. Agates occur in veins, and especially in the amygdule cavities of igneous rocks.

**Quartz-porphyry,** an igneous rock, consisting of crystals of quartz and felspar scattered porphyritically through a compact or very finely crystalline ground-mass of the same minerals. It occurs both in the intrusive rock and in the form of layers which have flowed out at the surface. Some of the quartz-porphyries which have a very compact or microfelsitic ground-mass appear to have been originally volcanic vitreous rocks—the glass having subsequently become devitrified. The non-porphyritle varieties which have a flinty or hornstone-like aspect are called *Felsite* (q.v.). *Quartzers-porphyry* is a name for Orthoclase-porphyry (q.v.).

**Quartz-rock, or Quartzite,** is a commonly occurring rock, composed of an aggregate of quartz-grains welded together. It is usually white, gray, or rusty yellow or reddish in colour, and has a splintery fracture. Under the microscope the grains show a rounded and often semi-fused appearance, as if they had been mutually amalgamated while in a softened condition. The siliceous paste in which the granules are frequently set has usually a crystalline texture, and now and again crystals of quartz are developed in it. The rock not infrequently occurs in strata of variable thickness, often forming mountain-masses. Sometimes it assumes a foliated structure (*Quartz-schist*), and contains scales of mica which occasionally form layers or laminae. The rock is obviously of sedimentary origin, and has subsequently been subjected to metamorphic action.

**Quartz-trachyte.** See *Liparite.*

---

### Quaternary

**Quasimodo Sunday.** See Low Sunday.

**Quassia,** a genus of trees and shrubs of the natural order Simarubaceae (q.v.); having hermaphrodite flowers, with five petals combined into a tube, and much longer than the small calyx, ten stamens, five germens, and only one style; the fruit composed of five drupes. *Quassia emarginata* is a native of the tropical parts of America and of some of the West India Islands. It is a shrub 10 to 15 feet high, with racemes of bright-red flowers, and large pinnate leaves, which are remarkably winged and jointed. The wood, and particularly that of the root, has a strong, purely bitter taste, and was at one time much used in medicine under the names of *Quassia-wood,* Bitterwood, &c. The flowers were valued in Surinam for their stomachic properties as early as the beginning of the 18th century; the wood of the root began to be known in Europe before the middle of that century, and was more fully brought into notice about 1756, by Rolander, a Swede, who had visited Surinam, and had learned its value from a negro, called Quass, Quasha, or Quacy. This negro had discovered it about 1730, and had employed it with great success as a remedy for fevers, so that though, as Rolander says, a very simple man, he had acquired a great reputation by his use of it. Linnaeus published a dissertation on it in 1761, and it was he who gave the genus its name *Quassia,* from the name of the slave by whom its medicinal qualities had been made known. The true quassia is now, however, little used; its name having been transferred to the Bitterwood (q.v.) of the West Indies, *Picrena* (or *Quassia*) excedens, a lofty tree, the wood of which possesses the same properties, although in an inferior degree; but this inferiority is compensated by the greater facility with which any requisite supply is obtained. It is the wood of this tree which is now sold as *Quassia-wood,* or Quassia-chips, in the colonies. It is used to a considerable extent instead of hops for making beer, although the use of it is illegal in Britain, and beer made with it is said to become muddy and flat, and not to keep. Quassia-wood is very feebly narcotic, and a decoction of it is used for killing flies. Cabinet-work made of it is safe from all attacks of insects. In medicine it is a valuable stomachic tonic; but in fevers it is not to be compared either in efficacy with cinchona and its alkaloids. Its properties depend on a bitter principle called quassin, C_{19}H_{28}O_{7}, which is present in minute amount in the wood.

**Quaternary,** or Post-Tertiary, the fourth great division of the fossiliferous strata, which embraces the Pleistocene (q.v.) or Glacial and Post-glacial (q.v.) and Recent systems.
Quaternions (or 'sets of four'), the name of a calculus of peculiar power and generality invented by Sir William Rowan Hamilton (q.v.) of Dublin. As a geometry, it primarily concerns itself with the operations by which one directed quantity or Vector (q.v.) is changed into another. Such an operation is called a quaternion, for reasons which will appear hereafter. From this point of view alone we shall discuss it here. We assume the law of vector addition, which asserts that the vector or directed line AC (see fig. 1) is equal to the sum of the vectors AB and BC, or any other directed lines parallel and equal to them. For example, the resultant of two velocities or coterminal forces is a vector equal to the vector sum of the components (see Composition). Quantities which do not involve the idea of direction or directedness are called Scalars; such are the quantities used in arithmetic and ordinary algebra. Parallel vectors can all be represented as scalar multiples of one another, or (better) of the parallel vector whose length is unity. By the latter representation, the scalar multiple gives the length or tensor of the vector. Thus any vector \( \mathbf{a} \) may be factorised into its tensor and directed unit part. This is symbolised by the equation \( \mathbf{a} = T \mathbf{U} \), where \( T \) and \( U \) appear as selective symbols of operation, separating out the length and direction respectively.

The operation which simply rotates a vector into a new direction without changing its length is a particular kind of quaternion called a Versor. A second application of this versor produces an exact equal rotation in the same plane—i.e. about the same axis. With this versor, therefore, are associated an axis having a definite direction and an angle through which any vector perpendicular to this axis is rotated by the versor operating on it. A very important case of the quadrantal or right versor, which turns a perpendicular vector through a right angle. Let \( \mathbf{i} \) represent the right versor whose axis is perpendicular to the plane of the paper. Then (fig. 2) if \( \mathbf{\beta} \) is any vector in the plane of the paper, the quantity \( \mathbf{i} \mathbf{\beta} = \gamma \) gives a vector perpendicular to \( \mathbf{\beta} \) and to the axis of \( \mathbf{i} \). A second operation gives

\[ i\beta = \gamma \beta = i\gamma = -\beta, \]

or symbolically \( i^2 = -1 \). The square of any right versor is negative unity. It is easy to show that \( i, \) where \( \mathbf{i} \) is a scalar, is an operator which still turns any appropriate vector through a right angle, but at the same time increases its tensor \( n \) times. Such an operator is a quadrantal quaternion, whose tensor is \( n \) and versor \( i \). A quaternion can always be factorised into its tensor and versor parts.

Now let \( O, \mathbf{O} \) (fig. 3) be the axes of two right versors \( i \) and \( \mathbf{1} \), making angle \( \theta \) with each other. Describe the sphere of unit radius with \( \mathbf{O} \) as centre, and draw the vector \( \mathbf{O}A \) or a perpendicular to \( \mathbf{i} \) and in the plane \( \mathbf{O} \mathbf{1} \). Draw \( \mathbf{O}B \) or \( \mathbf{B} \) perpendicular to \( \mathbf{i} \) and \( \mathbf{1} \)—i.e. upward from the plane of the paper; and finally draw \( \mathbf{OC} \) or a perpendicular to \( \mathbf{1} \) and \( \mathbf{B} \). Then first \( \mathbf{1} \mathbf{1} = \mathbf{\beta} \) and secondly \( \mathbf{1} \mathbf{i} = \mathbf{\beta} = \gamma \), so that \( \mathbf{i} (\gamma = \gamma /a) \) is a versor which rotates a into the position \( \gamma \). This versor has its axis parallel to \( \mathbf{O} \mathbf{B} \), and its angle equal to the complement of \( \theta \). Thus any versor can be represented by the product of two right versors perpendicular to it and making with each other the appropriate angle. If the two right versors are themselves at right angles, their product becomes the right versor perpendicular to both. We thus arrive at what is historically the basis of quaternions—viz. Hamilton's remarkable system of universally perpendicular right versors \( ij \). As operators (see fig. 4) they are connected by the equations

\[ \mathbf{i} \mathbf{j} = k = -ji \]
\[ \mathbf{j} \mathbf{k} = i = -kj \]
\[ \mathbf{k} \mathbf{i} = j = -ik \]
\[ \mathbf{i} \mathbf{k} = -1 = \mathbf{j}^2 = \mathbf{k}^2. \]

The special point to notice is the non-commutative character of the process of multiplication, \( \mathbf{i} \mathbf{j} \) not being the same as \( \mathbf{j} \mathbf{i} \).

The discovery of the equation \( \mathbf{i} \mathbf{j} = -\mathbf{j} \mathbf{i} \) on October 16, 1843, was quickly followed by the development of the whole calculus of quaternions. Now, if \( \mathbf{i}, \mathbf{j}, \mathbf{k} \) be any three vectors instead of right versors, the equation \( \mathbf{i} \mathbf{j} = -\mathbf{j} \mathbf{i} \) would still be true as an equation of operations. In fact, as is capable of easy proof, right versors obey the law of vector addition; and in the identification of unit vectors and right versors, or more generally of vectors and right quaternions, lies one of the great simplifications of the calculus. Thus the versor \( \mathbf{i} \mathbf{j} \mathbf{k} \) is a right quaternion whose axis (see fig. 4) is along the diagonal of the square of which \( \mathbf{i} \) and \( \mathbf{j} \) are the sides, and whose tensor is equal to the length of this diagonal.

The following conclusions are readily come to. The square of every unit vector is negative unity; the product of two parallel vectors is minus the product of their tensors; the product of two perpendicular vectors is a third vector perpendicular to both and having its tensor equal to the product of the tensors of its factors; the product of any two unit vectors in general a versor; the product of any two vectors is a quaternion whose tensor is the product of the tensors, and whose versor is as mentioned in the preceding sentence. The quaternion \( \mathbf{a} \mathbf{b} \) transforms \( \mathbf{b} \) into the vector \( \mathbf{a} \); and \( \mathbf{b} \mathbf{a} \), being itself a quaternion which undoes the effect of the right quaternion \( \mathbf{b} \), must also be a right quaternion—i.e. a vector. In fact, \( \mathbf{b} \mathbf{a} \) is always equal to a scalar multiple of \( -\mathbf{b} \). Hence the quaternion \( \mathbf{a} \mathbf{b} \) is the operator which changes the vector \( \mathbf{b} \mathbf{a} \) into the vector \( \mathbf{a} \).

This operation involves four numbers: first, the change of length; second, the angle through which the one vector must be rotated so as to bring it into parallelism with the other; and third and fourth, the two numbers necessary to fix the aspect of the plane in which the rotation takes place, or the direction of the axis about which rotation takes place. Thus a quaternion, in general, depends on four numbers, whence the name. A vector or quadrantal quaternion is a degenerate quaternion.
involving only three numbers; while a scalar, which might be defined as the quaternion which changes one vector into a parallel one, is still more demonstrative. On this basis only one number—viz. itself.

There is still one very important representation of a quaternion to consider. This is done most simply as follows: Let $a\beta$ be the two vectors $OA$, $OB$ (fig. 5). Resolving $\beta$ along and perpendicular to the plane $OM$, we get $\beta = OM + ON$; and hence $a\beta = OA.OM + OA.OM$.

But $OA.OM$, being the product of two parallel vectors, is minus the product of the lengths or tensors. On the other hand, the product $OA.OM$, being the product of two perpendicular vectors, is a vector perpendicular to the plane of the paper with tensor equal to twice the area of the triangle $OAB$. Thus the quaternion $a\beta$ is equal to the sum of a scalar and a vector; and generally for any quaternion ($g$) we have the relation

$$g = S.q + V.q,$$

where $S$ selects the scalar part and $V$ the vector part. The geometrical meanings of $S$ and $V$ operating on $a\beta$ are easily seen to be these—

$$S.a\beta = - TaT^3 \cos \theta, \quad V.a\beta = iTaT^3 \sin \theta,$$

where $i$ is the unit vector perpendicular to $a$ and $\beta$.

We end with a few illustrations. Thus, if $a$ is a constant vector, and $r$ a variable vector, the equation $S.a = c$, a constant, means that the resolved part of $r$ along the direction of $a$ is constant, and that therefore the extremity of $r$ traces out a plane perpendicular to $a$. The versor that turns any line through an angle $\theta$ in a given plane has the form $\cos \theta + i \sin \theta$, where $i$ is the right versor perpendicular to that plane.

De Moivre's theorem (see DEMOIVRE) at once follows if we write $i = \sqrt{-1}$. Finally, if $\beta$ represents a force acting at the extremity of $a$, $V.a\beta$ is the vector moment of the force about the origin; and in the almost self-evident equation

$$V.a(\beta - \beta') = V.a\beta + V.a\beta',$$

we have a completely general demonstration of Varignon's theorem of moments. See MOMENT.

Hamilton's Lectures on Quaternions (1853) and his Elements of Quaternions (1866) are still the classical works on the subject. Tait's Elements of Quaternions (3d ed. 1890) is probably better fitted as a textbook for the student to work through, and contains some original applications of high physical interest. Kelland and Tait's Introduction to Quaternions (1874) may be recommended to the beginner. Tait's treatise has been translated into French and German.

Quatre-Bras, a village of Belgium, about 10 miles SSE. of Waterloo, situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name ("four arms"). On 16th June 1815, two days before the battle of Waterloo (q.v.), Quatre-Bras was the scene of a desperate battle between the English under Wellington and the French under Ney. The honours of the field remained with the former; but the severe defeat of Bliicher the same day at Ligny compelled Wellington to retreat. The battle on the English side was 32,000, on the French 41,400, amongst the Allies being the Duke of Brunswick, the gallant chief of the Black Brunswickers. A monument to his memory, a bronze lion 103 feet high, was erected in 1890.

Quatrefages, Jean Louis Armand de, a naturalist, was born at Berthezé (Yonne) on 10th February 1810, studied medicine at Strasburg, and in 1838 was appointed professor of Zoology at Toulouse. But this post he soon resigned and went to Paris, to study further for himself. In 1850 he was elected professor of Natural History in the Lyceé Napoléon, and in 1855 of Anatomy and Ethnology at the Natural History Museum in Paris. He devoted his attention principally to anthropology and the lower animals, especially annelida, and his chief works are L'Espece Humaine (1877; 5th ed. 1886; Eng. trans. 1879); Souvenirs d'un Naturaliste (1854; Eng. trans. 1857); Unité de l'Espece Humaine (1861); Crania Ethnica (1875-82); La Race Prussienne (1879; Eng. trans. 1872); Les Pygmées (1887); Histoire Naturelle des Annuâlés (2 vols. 1886); Dictionnaire des Français (1892); and Théories Transformistes (1892). He died 13th January 1892. See ANTHROPOLOGY.

Quatrefoil, an opening in tracery, a panel, &c., divided by cusps or featherings into four leaves. This form is much used as an ornament in Gothic architecture.

Quatre-Mère, ÉTIENNE MARC, a French orientalist, was born in Paris, 12th July 1782, and from his earliest childhood to his latest years, immersed in inestimable study; he lived more after the fashion of a medieval recluse than a modern scholar. Employed in 1807 in the manuscript department of the Imperial Library, he was promoted in 1809 to the Greek chair in the College of Rouen, and in 1819 to the chair of Ancient Oriental Languages in the Collège de France, and in 1827 he became professor of Persian in the School for Modern Oriental Languages. He died 18th September 1857. Although a man of vast and accurate knowledge, he had little critical insight or originality. His principal works are Recherches sur la Langue et la Littérature de l'Égypte (1808), proving that the language of ancient Egypt is to be sought for in modern Coptic; Mémoires Géographiques et Historiques sur l'Égypte (1810); Memoire sur les Nabatéens de la Syrie (1819); Récherches des Sultans Mamelouks (1837), from the Arabic of Makrizi; Histoire des Mongols de la Perse (1838), from the Persian of Rashid ed-Din; an edition of the Arabic text of the Prolegomena of Ilmunhaldun; and a multitude of articles scattered through the pages of the Journal Asiatique and the Journal des Savants.

Besides this, he gathered materials for Arabic, Coptic, Syriac, Turkish, Persian, and Armenian dictionaries.

Quattro Cento (Ital., 'four hundred', a contraction for one thousand four hundred; cf. CINQUE CENTO), in Italian a term for the 15th century, its literature and art; the early Renaissance. Outstanding Quattrocentisti in art are Donatello, Della Robbia, Brunellesco, Masaccio, Ghirlandajo, Lippo Lippi, and Mantegna.

Quebec, a province of the Dominion of Canada, lies to the east of Ontario, and between that province and New Brunswick. Deducting the surface of its inland waters, including the River and Gulf of St. Lawrence, the area of Quebec, including recent additions, is 347,530 sq. m. The surface of the country is varied and grand, consisting of extensive rivers and lakes, large stretches of agricultural land, and immense forests. Two ranges of mountains run through the province from southwest to north-east, that on the south side of the St. Lawrence being called the Notre Dame or Green Mountains, stretching from Quebec to Gaspe, while on the north side of the river is the Laurentian Range (see CANADA). The chief river in the
Province is of course the St Lawrence (q.v.), which has many tributaries of great length, the principal being the Chaudière, the St Maurice, and the Saguenay. The influence of the tide in the St Lawrence is felt as far up as the town of Three Rivers, which is nearly 900 miles from the Straits of Belle Isle. Several of the rivers are navigable for the greater part of their course, while others are used in floating timber and building supplies, manufacturing industries with almost unlimited water-power. There are numerous lakes in the province, of which the best known are Temiscamingue, Metatapia, Temiscowata, Memphremagog, and St John. The province has a coast-line of 825 miles on the Atlantic. 

The climate of Quebec is very much like that of the other parts of eastern Canada, excepting perhaps that the winter is slightly colder; but, as in Ontario, and in the maritime provinces, the air is generally dry and brilliant, the cold is not felt to be unpleasant, and it is no disadvantage to either the agricultural or other industries; in fact, the climate is exceedingly healthy. The soil of the province is rich and loamy, well adapted for the growth of products of all kinds. Cereals, hay, and root-crops grow everywhere in abundance. Indian corn, hemp, flax, and tobacco are also raised in many parts of the province. Fruit in considerable quantities is grown, especially apples and plums, which are exported largely. Small fruits are very abundant, and grapes ripen in the open air in many districts. Tomatoes are also a field-crop. Cape-breeding on a large scale was carried on, and many thousands of animals are exported to Great Britain yearly. For pasturage the land of Quebec is of special excellence, particularly in the eastern townships and north of the St Lawrence. 

The fisheries in the River and Gulf of St Lawrence are very prolific, and all the smaller rivers teem with fish. Along the St Lawrence especially this industry is an important one. The value of the fisheries is over $2,000,000 annually. The province is notably rich in minerals. Alluvial gold is found in various places, copper is found in the eastern townships, while iron is very generally distributed. Other minerals, such as lead, silver, platinum, and zinc, are also found, while the asbestos deposits, and those ofapatite, or phosphate of lime, have achieved a reputation far beyond the limits of the province. Agriculture and dairy-farming form the chief occupations of the people at present, but manufactures, the fisheries, and commerce employ a considerable part of its inhabitants, as do also lumbering, mining, and shipbuilding. The principal articles manufactured are cloth, linen, furniture, leather, sawn timber, flax, iron and hardware, paper, chemicals, sugar, soap, india-rubber goods, boots and shoes, cotton and woollen goods, cheese (there were 672 cheese-factories and creameries in 1891), and ferries.

Quebec has nearly 3000 miles of railway in operation, besides important canals, such as the Lachine, Beaumanoir, and Chambly. A great portion of the total area is covered with timber, chiefly red and white pine, the hardwoods, however, forming one-third of the total exports of the province. The other principal exports are animals and their products and agricultural and dairy produce, amounting altogether to about $60,000,000 annually, the greater proportion going to Great Britain. The imports reach nearly $3,000,000, the largest coming from Great Britain. The revenue in 1897 amounted to $3,837,466, the expenditure to $4,892,282, and the provincial debt to $21,718,476. The revenue is derived from the saldcentration from the Federal treasury, receipts from land sales, timber limits, mines, licenses, and certain other direct taxes.

The area of the province is represented in the Dominion Senate by 24 members, and in the House of Commons by 65 members. The population consists largely of French-Canadians, descendants of the French settlers living in the country when it was transferred to Great Britain in 1763. The population in 1881 was 807,627, of which 707,024, or 87 per cent, of the total, were French, 123,749 Irish, 81,515 English, and 50,923 Scotch. In 1891 the total population was 1,488,886. In 1873, at the time of the session, the French population did not exceed 80,000, so that the progress in less than 130 years has been very remarkable, and in strange contrast to the state of things in old France. Families of twelve and fourteen are quite common amongst French-Canadians. The English population does not increase in the same way.

The French-Canadian language is still used in the province, and is sanctioned by law; the same remark applies to the French law. It is generally supposed that these privileges were conferred upon the French Canadians by act of the Act of 1867, with the provinces of Canada. 

Quebec is the capital of the province of the same name, is situated on a steep promontory on the north bank of the St Lawrence at its junction with the St Charles River, 300 miles from the mouth of the St Lawrence and 180 miles below Montreal (172 by rail). The highest part of the headland is Cape Diamond, 333 feet above the level of the
QUEBEC

Quebec is the most important military position in Canada. The citadel occupies an area of 40 acres, and commands a magnificent view. The harbour is spacious, and the docks and other buildings are proof of engineering skill. On the Levis side of the river is the extensive grazing- dock. The city is divided into an Upper and Lower Town. In the latter are situated the banks, warehouses, and wholesale and retail stores. In the Upper Town are the city records, houses of business, buildings, churches, gardens, and retail shops. Towards the west are the thriving suburbs of St John, St Louis, and St Roch's. The last named has become a place of commercial importance, with its immense warehouses and stores. To the south-west of St John are the Plains of Abraham, the historic battlefield, where a column 40 feet high has been erected to the memory of General Wolfe. Another monument, 65 feet high, dedicated to Wolfe and Montcalm, is situated in the Governor's Garden, and immediately overlooks the St Lawrence. On the St-Peyre Road is an iron pillar crowned by a bronze statue, commemorating the deeds of the British and French under Murray and Levis in 1760. There is a shaft also to the memory of Cartier and the Jesuit Brebeuf. In 1898 a statue to Champlain (q.v.), founder of the city, was unveiled by the bishop of Quebec. In the city hall is Dufferin Terrace, 1400 feet long, commanding a noble view. The Grand Battery is also picturesque situates. Three handsome modern gates have replaced the old gates. The principal edifices are the parliamentary and departmental buildings, courthouse, post-office, custom-house, city hall, masonic hall, basilica, the archiepiscopal palace, the Anglican Cathedral, Church Hall, and Young Men's Christian Association building. Laval University, named after the first Roman Catholic bishop of Montreal in 1663 for his services to the education of the province, is an important institution, holding two charters, one from Queen Victoria (1852) and the other from Pope Pius IX. The building is spacious, well equipped, and contains a library of 90,000 volumes, a museum and art gallery, laboratory, &c. The faculties are theology, law, medicine, and arts. The annual seminary is a department of the faculty of theology and philosophy. Other Roman Catholic halls of instruction are Laval Normal and Model School, the Ursuline Convent, the College of the Good Shepherd, and Laval College. The College of Presbyterians, affiliated with McGill University, is situated at the foot of the mountain, and is the most noted of the schools. They have a number of students, and their college is well equipped. The city has also a large number of institutions for the benefit of the poor and infirm, including a hospital for the insane, and a school for the deaf and dumb. The newspapers are published in French and English. The supply of water is continuous and good, and comes from Lake St Charles. The city is lighted with gas, and electricity, the power for the latter being afforded by the Falls of Montmorency, 9 miles distant.

Quebec is connected with all the cities in America by various lines of railway, and is at the head of ocean steamship navigation to Europe. Slipways and docks, the result of the industrial prosperity of late years, are on the waterfront. The principal manufactures are worsted goods, iron-castings, machinery, carriages, cutlery, nails, leather, musical instruments, boots and shoes, paper, tobacco, steel, &c. The chief exports are tobacco, fish, and flour. The city has suffered from disastrous fires, which have led to improvement by the re-erected of finer buildings. The city elects three members to the Canadian House of Commons and three members to the Quebec House of Assembly. Quebec is the seat of the Roman Catholic cardinal-archbishop and the see of the Anglican bishop. It was originally called Stadacona, and was visited by Cartier in 1535. In July 1608 Champlain received the laying on of hands at the present name. It continued to be the centre of French trade and civilisation, as well as of the Roman Catholic missions in North America, till 1759, when it fell into the hands of the British (see Wolfe). In 1783 it was ceded to Great Britain by the treaty of Paris, and in 1801 (see British North America Act 1867). Quebec is 62,446; (1891) 63,000; in 1898 to the city proper was annexed the suburb of St Sauveur, with its population of 15,000.

QUEEN

Quebec is the city of Aspidoesperma quebracho (natural order Apocynaceae), which grows in the Argentine Province. It has a slightly bitter taste, and contains a number of active principles, of which the most important is aspidospermine. Both the bark and aspidospermine act like quinine in lowering the temperature in some cases of fever. They promote secretion from the kidneys, intestinal and salivary glands, and relieve dyspepsia or asthma of functional origin. The liquor is taken in doses of five to eight grams, aspidospermine in doses of one gram per day.

Quedlinburg, a town of Prussia, at the northern base of the Harz Mountains, 56 miles by rail SE. of Brunswick. Founded by Henry the Fowler in 924, it is still in part surrounded by a wall flanked with towers. On an eminence overlooking the town stands the castle, which is prior to the Reformation the residence of the archbishops of Quedlinburg, who were independent princes of the empire, and had a vote in the diet, and other privileges. The castle chapel contains monumental tombs of Henry I., his wife Matilda, and the Countess of Königsmark. Here Kluspeck and Karl Ritter were born. The town has manufactures of sugar, wire, goods, and farinaceous foods, and gardening is prosecuted on an extensive scale. (Pop. (1890) 20,761.

Queen (A.S. cwfn, 'a woman', cognate with Dutch kweven, Ice. kvain, Gr. γυνή, Sansk. janti), in its primary significance, has in all ages been invested with privileges not belonging to other married women. The English queen, unlike other wives, can make a grant to her husband, and receive one from him. She can sue and be sued alone, and purchase land without the king's concurrence. The Statute of Treasons makes it treason to compass her death, or to violate her chastity, even with her consent, and the queen consenting is herself guilty of treason. If accused of treason, the queen is tried by the peers of the realm. The queen-consort is exempt from the civil law and is not subject to any court. She has a Household (q.v.) of her own. It has been the usual practice to crown the queen-consort with solemnities similar to those used in the coronation of the king. In the case of Queen Caroline, consort of George IV., the ceremony was never performed. Certain rents or revenues were anciently appropriated to the income of the queen, but no separate revenues seem ever to have been settled on any queen-consort by parliament. Her personal expenses are defrayed from the king's privy purse, and are not assessable. The queen-dowager is the widow of the deceased king. She retains most of the privileges which she enjoyed as queen-consort, nor does she lose her dignity by re-marriage; but it has been held that no one can marry the queen-dowager without...
permission from the king, on pain of forfeiture of lands and goods. On the marriage of a king, or accession of an unmarried prince, parliament makes provision for the queen’s maintenance, in case of her regency.

The queen-regnant is a sovereign princess who has succeeded to the kingly power. In modern times, in those countries where the Salic law does not prevail, on failure of males a female succeeds to the throne. By an act of Queen Mary, the first queen-regnant in England, it was declared ‘that the regal power of this realm is in the queen’s majesty as fully and absolutely as ever it was in any of her most noble progenitors kings of this realm; and it has since been held that the powers, prerogatives, and dignities of the queen-regnant differ in no respect from those of the king. The husband of the queen-regnant is her subject; but in the matter of conjugal indissolubility he is not subjected to the same penal restrictions as the queen-consort. He is not endowed by the constitution with any political rights or privileges, and his honours and precedence must be derived from the queen. The Prince Consort was naturalised by 3 and 4 Vict., words being used which enabled him to be a privy-councillor, and sit in parliament; but it was provided that His Royal Highness was not, by surviving of his wife, to become any interest in the property of Her Majesty. By a decree of the Queen, Prince Albert enjoyed place, pre-eminence, and precedence next to Her Majesty.

**Queen Anne’s Style.** See RENAISSANCE.

**Queen Anne’s Bounty.** The name given to a fund appropriated to increase the incomes of the poorer clergy of England, created out of the first-fruits and tithes, which before the Reformation formed part of the papal exactions from the clergy. The first-fruits are the first whole year’s profit of all spiritual preeminents, and the tithes are one-tenth of their annual profits, both chargeable according to the ancient declared value of the benefice; but the poorer livings are now exempted from the tax. Henry VIII., on abolishing the papal authority, annexed the first-fruits and tithes to the crown; and, by an act passed in 1703, these revenues were set aside, with the consent of Queen Anne, to form a perpetual fund for the augmentation of poor livings. The Archbishops, Bishops, and Masters of the Rolls, Privy-councillors, Lieutenants and custodes rotulorum of the counties, the Judges, Queen’s Serjeants-at-law, Attorney- and Solicitor-general, Advocate-general, Chancellors and Vice-chancellors of the two Universities, Lord Mayor and Aldermen of London, and mayors of the several cities, and by supplemental charter the officers of the Board of Green Cloth, the Queen’s Council, and the four Clerks of the Privy-council were made a corporation by the name of ‘The Governors of the Bounty of Queen Anne for the Augmentation of the Maintenance of the Poor Clergy,’ and to this corporation was granted the revenue of first-fruits and tithes. The governors’ grants consist of capital sums of £200 to meet benefactions of money, land, tithe, rent-charges, stipends, &c., of equal value, out of which not exceeds £200 in any annual income. A benefaction may be offered and a grant sought either for the augmentation of the endowment of a benefice, or towards the cost of providing or improving a parsonage-house, &c. The application of the funds at the disposal of the governors is supervised by the Bishop of London and subject to all statutory provisions. The annual revenue in 1890 was £176,896. See Crispe, Laws of the Church and Clergy.

**Queen Anne’s Earthing.** See FARTHING.

**Queensborough, a village on the Isle of Sheppey, Kent, 2 miles S. of Sheerness, was founded by Edward III. (1359), and named after Queen Philippa.** A line of steamers sail daily between Queensborough and Flushing in Holland. Pop. 982.

**Queen Charlotte’s Islands, a group to the north of Vancouver Island, off the coast of British Columbia. Area, 5100 sq. m. The two principal islands, Graham and Moresby, have a length of 160 and a greatest breadth of nearly 70 miles. The climate is healthy, but very rainy. Anthracite coal, copper and iron ore, and gold-bearing quartz have been found, and forests abound. The inhabitants are about 2000 Indians, who engage in fishing.**—Queen Charlotte’s Sound is a strait separating Vancouver Island, on the north, from the mainland.

**Queen of the Meadow.** See SPIREA.

**Queen’s Bench.** See COMMON LAW.

**Queen'sberry, William Douglas, Duke of,** ‘Old Q,’ was born in 1724, and succeeded his father as Earl of March, his mother as Earl of Huntington, and his great-grandfather as Duke of Queenberry. He was famous for years as a patron of the turf, and infamous always for his shameless debaucheries. He is said to have displayed great taste in a song, but to-day lives solely through Wordsworth’s indignant sonnet, composed at Nelson, whose venerable trees ‘wait on poor Queen’sberry, who had felled, to spite his heir or to dower one who he flattered himself was his daughter. After long fear of death he died unmarried, worth over a million sterling, on 23rd December 1810, and was buried beneath the communion-table of St. James’s Church, Piccadilly. See Life by J. R. Holborn (1885).

**Queen’sberry Plot.** See LOYAT.

**Queen’s College.** For women (43 to 45 Harley Street, London), was established in 1848, and incorporated by royal charter in 1853. It owed its existence partly to the Governors’ Benevolent Institution and partly to a movement originated by the Rev. G. G. Neidn, and supported by the Rev. F. D. Maurice and other King’s College professors. Its Committee of Education as at first constituted included the names of Maurice, Trench, and Kingsley; of Sterndale Bennett and Hullah; of Ansted and Edward Forbes; of Mulready and Richmond. Its aim is to provide for the higher education of women, in the first place by a liberal school and subsequently by a four years’ course of college education. The college curriculum includes the school for pupils under fourteen years of age, the preparatory class for pupils too old to be admitted to the school but too backward for the first year’s classes in college, and the college course of three years for the training for the grade of ‘associate,’ or six years or more for that of ‘fellow.’ This college is self-supporting, and is at present without any endowment. The students number about 360, and are chiefly day scholars, but boarders are received by authority of the council at two adjoining houses in Harley Street.

See Women’s Rights; the Queen’s College Calendar; Maurice’s Queen’s College; its Objects and Method (1848). Mrs A. Tweedie, The First College for Women (1888).—For Irish Queen’s Colleges, see IRELAND, Vol. VI. p. 292.

**Queen’s Counsel.** See King’s Counsel.

**Queen’s County, an inland county of Leinster, Ireland, is bounded N. by King’s County, S. by Kilkenny, and W. by Tipperary, and measures 87 miles long and 45 miles broad. Its area is 424,554 acres. Pop. (1841) 153,988; (1861) 90,650; (1881) 73,124; (1891) 64,630, of whom 56,743 were Catholics. The number of acres under crop in
QUEEN'S EVIDENCE

1890 was 131,680, and of these 45,312 were under grain-crops (chiefly oats and barley), 36,538 were permanent grass, 30,660 under green-crops (mostly potatoes), and 9,480 were meadow. Nearly 144 per cent. of the total area is barren. Queen's County is, for the most part, within the basin of the Barrow, and is flat and, except where bogs prevail, fertile. It is also drained by the Nore and crossed by the Grand Canal. On the north of the county are the high mountains, Mounts- tains, reaching 1734 feet. Coal occurs in the southeast. Agriculture is the principal occupation; there is much dairy-farming, and a little woollen and cotton weaving. This district was made a shire in honour of Queen Mary, from whom also the chief town, Maryborough (pop. 2972), was called. The antiquities include a round tower and some ecclesi- astical and feudal remains, the most important being a castle on the picturesque rock of Dunama- se. The county embraces two parliamentary districts, each returning one member.

Queen's Evidence. See Approver.

Queensferry, a town of Linlithgowshire, 9 miles WNW. of Edinburgh, on the south shore of the Firth of Forth, is so named by the great Forth Bridge (1892-90; see Bridge, Vol. II. p. 443). Named after St. Margaret (q.v.), it has been a burgh of royalty since 1362, a royal burgh since about 1358, and a police-burgh since 1822; with Stirling, &c. it returns one member. Remains of a Carmelite friary were converted in 1890 into an Episcopal church; and one of its hotels is the Hawes Inn of Scott's Antiquaries. In the neighbourhood are the seats of the Earls of Rosebery and Hopton. Pop. (1841) 1233; (1881) 1966; (1891) 1531.

Queensland. This, the youngest and second largest of the Australian colonies, comprises an area of 668,497 sq. m., representing a country five and a half times the dimensions of the United Kingdom. It was little known until December 1823, when Surveyor-general Oxley, acting on information imparted by two castaway convicts, discovered the river which he named the Brisbane, in honour of the governor of the mother-colony of New South Wales. Queensland was proclaimed by imperial command a separate colony in 1839 under Sir George Ferguson Bowen as first governor. The coast-line is 2250 miles in length. The south-east corner, lying at Point Danger, generally follows the twenty- ninth parallel of south latitude. The northernmost point of the mainland is Cape York; but, since the annexation of the Torres Straits Islands, the limit may be reckoned from the parallel of 10°. Queensland is 1300 miles in length from north to south, and 800 miles at the greatest breadth. The width gradually lessens until, with Cape York peninsula, it assumes a pyramidal outline. Its western boundary for the most part is a straight line, marked by the 138th degree of longitude. Running more or less parallel with the eastern coast is a backbone of mountains, averaging a distance of 50 miles from the sea. Upon its intervening belt settlement has principally taken place. The Main Dividing Range is a continuation of the bolder Australian mountain system, and forms the backbone of New South Wales. The highest peaks are Bellenden-Ker (5500 feet) and Mount Dalrymple (4250). The mean altitude of the range is 2000 feet. The east side is ridgy and thickly timbered with the eucalypt peculiar to the Antipodes. The country west of the mountains is to a large extent open downs and plains, often of the richest black soil, covered with the finest fattening herbage in the world.

Queensland is a fairly watered land. The largest rivers on the east coast are the Brisbane, Mary, Burnett, Fitzroy, Burdekin, and Johnstone. There is also a western watershed, including the rivers Mulgillan, Herbert, and Diamantina. The head- waters of the rivers in all directions, and the mountain ranges, flow through the boundless prairie-country. The rivers Flinders, Leichhardt, Gilbert, Mitchell, and Gregory flow northward to the Gulf of Carpen- taria. The eastern rivers, affording communication from the interior, have assisted in the creation of a great pastoral industry and have also opened up the island-studded coast. Rockhampton is on the Fitzroy, Maryborough on the Mary, and Mackay on the Pioneer. The principal harbour in Queens- land is Moreton Bay, and between it and Thursday Island there are numerous ports of growing im- portance. The alluvial coast-lands are devoted to ordinary and semi-tropical agriculture and timber produce. The basaltic plains and tablelands be- yond the Main Range, extending to what is still known as the 'Never Never country, are occupied by pioneer pastoralists with their herds of sheep and cattle.

In such a colony, two-thirds of which lies within the tropics, there is a wide variety of climate and natural capabilities. The summer heat is un- doubtedly great; but there is immunity from the heat winds since a prevailing north-westerly blows across Australia. The heat being dry, although the maximum register is 108° (the winter minimum being 34°), the exhilarating quality of the atmo- sphere is such that the hottest weather is not unbearable. For seven months of the year the climate is most enjoyable, and not improperly com- pared with that of Madeira. At midsummer (Christmas time) the rainy season commences in the tropical portion, and extends more or less until March. The colony enjoys a high repute for health, gives a low death and a high birth rate, and is free from the severe and contagious diseases. Invalids sent from the old country in what appear to be the last stages of consumption often regain health in Queensland, and live to become old inhabitants. The population at the 1891 census was 393,088, consisting of 223,781 males and 170,157 females. Free and assisted emi- gration is one of the features of government policy; and some idea of the rapid growth of Queensland may be formed from the fact that Brisbane, which in 1851 had a population of 30,953, ten years later numbered 75,000 within its five-mile radius. There are some 22,000 aborigines, mostly in the unsettled country. The revenue to June 1890 was £3,211,795; expenditure, £3,695,774; only in one of the pre- ceeding four years did the revenue exceed the expenditure. In 1890 the public debt amounted to £281,105,684—nearly £200 a head. A table of the population, revenue, comparative crops, exports, &c. of Queensland and the other Australian colonies will be found in the article AUSTRALIA.

Much of the marked prosperity of Queensland is due to the development of ocean and intercolonial steam communication. The British India Steam Navigation Company has a direct line between London and Brisbane, carrying monthly mails and despatching intermediate boats; and there is a regular coastal service to the other colonies. The steamships make regular calls at the ports for the government, from its earliest establishment, to construct harbours and improve the rivers, the coast of Queensland is now one of the best lighted in Australia. The navigable streams have been dredged at enormous cost, and the largest ocean steamships can now ascend the Brisbane River to discharge cargo at the city wharves. The postal system is worked by 834 post-offices, with a two-penny postage on inland letters and a penny for the towns. The railway system was rapidly extended in 1830-90; up to 1890, 2450 miles had been
Queensland possesses a wealth of gold and other mineral resources; and machinery has reduced gold-mining to a settled and scientific industry. After the disastrous gold rushes of the early days the miners profited by experience. But the real era of paying gold mining in Queensland did not begin until 1888. From that date to the end of 1896 its mines produced $1,198,190 ounces of gold, valued at $396,165. In 1887 the yield was 793,103 ounces; in 1895 it had decreased. In consequence of these changes it is to be regretted that Mount Morgan (q.v.) mine. It is supposed that this unique formation, 1,233 feet above the sea-level, was once a hot spring, the water of which held in solution gold which was precipitated and consolidated with other mineral matter into the coarse ferruginous stone which, contrary to the previous theories of geologist and miner, has proved the most wonderful gold-bearing material in the world. Its fine and pure gold is worth four guineas an ounce, and the gross annual output has been estimated at £1 million pounds sterling. The value of its products is shown by the fact that Charters Towers, Ravenswood, Etheridge, Gilber- ton, and Palmer. A recently discovered gold-field is the Croydon, on the edge of the alluvial flat extending to the Gulf of Carpentaria. The Palmer is the most extensive alluvial field in the colony. Coal, copper, and lead, quicksilver, manganese, and iron are found in Queensland; and there are valuable coal-mines. Opals of great brilliancy and variety of colour have been found in a few localities, and specimens of the diamond, ruby, sapphire, and topaz near Stanthorpe. Agates occur in many localities.

The wool of Queensland, clipped from the merino and coarse-woolled sheep, still maintains its high character. The number of sheep in the colony in 1890 was 14,470,095; cattle, 4,872,416; and horses, 392,364. The annual exports of wool, hides, skins, and tallow represent a total value of £17 millions. The manufactures of Queensland comprise metalfoundries, sugar-mills, tanneries, flour-mills, distilleries, saw-mills. Tweed-factories are worked in the neighbourhood of Ipswich. Of late years the teoche-dealer and pearl fisher of Torres Straits have been highly productive; and preserved meats have also become an established industry.

The seat of government is Brisbane, and the principal provincial towns are Rockhampton, Ipswich, Townsville, Cooktown, Maryborough, Gympie, Charters Towers, (see also the Darling Downs), Dalby, Roma, and Bowen. The government is vested in a governor appointed by the crown, an executive council, and two houses of parliament. The upper house or Legislative Council consists of thirty-nine life members, named by the governor, and sitting under a president elected by themselves; and the Legislative Assembly numbers seventy-two members, elected on a franchise that is virtually manhood suffrage. State aid to religion was abolished by one of the first acts of parliament. The educational system is free, secular, and compulsory, and the annual expenditure is—primary state schools, £208,747; grammar and university education, £121; technical education, £231. The defence of the colony was provided by act of parliament in 1884. A small permanent force, a defence contingent (whose members are paid for each day's drill), and volunteers make up an enrolment nearly 5,000 men. But every male between eighteen and fifty years of age has to be on military service in an emergency. The entrance to the Brisbane River (twelve miles from the capital) is defended by a battery and torpedo works, and there are two gunboats, torpedo and packet boats, and a submarine vessel.

About 4,184 million acres of land still belong to the crown, the greater part leased to squatters as sheep and cattle runs. The object of the recent governments of Queensland being to foster agricultural settlement and closer pastoral occupation, the tendency now is to leasing rather than selling; and to prevent the aggregation of large estates.

Market-gardening in Queensland, even in the large towns, is principally done by Chinamen, who have the special gift of patience for the work. On the Darling Downs, which is the garden of Queensland, oranges, lemons, limes, citron, mandarins, mandarin oranges, passion-fruit, and guavas bear profusely, and north of Capricorn all the fruit trees and spices of tropical value might be cultivated with profit but for the scarcity of labour. Ginger, pepper, and nutmeg are indigenous. The beautiful collection of timbers shown at the Colonial and Indian Exhibition in London emphasised the value of the forests of Queensland. Amongst the hardwoods are the ironbarks, stringy-barks, gums, and bloodwoods. There are several varieties of tamarinds, and the easily-worked softwoods include the sugar trees, white mahogany, red cedar, yellowwood, silky oak, tilium, and beech are prized for cabinet and ornamental purposes.

The wild animals of Queensland are neither numerous nor dangerous, always excepting the worst varieties of the snake. Alligators are numerous and destructive in the rivers of tropical Queensland. The fauna includes the usual Australian marsupials—the platypus, dingo, flying-fox, &c. Many of the birds are of gorgeous plumage. The cunnamara, the grassy swamp, is a rare appearance in the north. The rabbit has so far been successfully kept out by the Aboriginal, who tolerable success; but this imported pest is an object of dread in Queensland, which suffered so severely, before the legislature assisted in their suppression, from the plague of kangaroos. The sea-fishing is unsurpassed, and the Moreton Bay oysters are exported in quantities to the sister colonies. From the Dugong (q.v.), besides the oil, is obtained a hide invaluable for thick machinery belting.

Queensland, in common with other Australian colonies, suffers occasionally from floods and droughts. During one of the severest droughts of the century, the necessities of life were so inadequate that it was necessary for the government to give food to the people. The sugar industry is now generally recognised as an essential protection for development in the future. The sugar industry, which had somewhat declined in value, in 1898-99 showed an increase of 50 per cent. on the previous year. Owing to the rigorous laws
passed to discourage the influx of Polynesian or Chinese labour (see Coolies), the cost of cultivat-

Que^taro, Quercitron, (lieen's the name of a dyestuff and of the species of oak of which it is the bark. This oak (Quercus coccinea, var. tinctoria), also called Dyer's Oak and Yellow-barked Oak, is a native of North America—one of the noblest forest trees of the continent in New England, in New York and as far south as Georgia, although there only at a considerable elevation. For the dyestuff, see DYE-

ING, Vol. IV. p. 139.

Quercitron, an important town of Mexico, capital of Querétaro state (see MEXICO), is charac-

teredly situated on a hilly plateau, 6272 feet above sea-level, 153 miles by rail NW., of Mexico city. It contains a government palace, a cathedral, an

aqueduct supported in part upon arches 90 feet high, and two large cotton-spinning mills, employ-

ing 2300 hands. Here the Emperor Maximilian cast short by order of a court-martial, 19th June 1867. Pop.

Quesnay, a primitive mill for grinding corn, the stone of which was turned by the hand. It was a contrivance of great antiquity, and so well adapted for the wants of a primitive people, that we find it perpetuated to the present day in remote districts of Ireland and some parts of the Hebrides and Shetlands. The remains of querns have been dug up in Britain, Ireland, and the United States, wherever the traces of ancient population are found. They occur in the Scottish Earth-houses (q.v.), or cyclopean underground dwellings; in the lake-

dwellings of Ireland, Scotland, and Switzerland; and abundantly among the remains of the Roman period in Britain and northern Europe. The most usual form of quern consists of two circular flat stones, the upper one pierced in the centre with a narrow funnel, and revolving on a wooden or metal pin inserted in the lower. The upper stone is occasion-

ally equipped with iron or steel teeth and grooves, designed to crush and grind the grain. In the Roman period it is sometimes funnel-shaped, with grooves radiating from the centre. In using the quern, the grain was dropped with one hand into the central opening, while with the other the upper stone was revolved by means of a stick, inserted in a small opening near the edge. As early as 1284 an effort was made by the Scottish legislature to supersede the quern by the water-

mill, which did not, however, prevent hand-mills from being largely used in Scotland down to the beginning of the 18th century. Probably the oldest British type of quern is that which was prepared from a section of oak. A less simple variety of the hand-quern, known as the Pot Quern, and also of great antiquity, consists of a circular stone basin, with a hole through which the meal or flour escapes, and a smaller circular stone forming into it, perforated with an opening through which the grain was thrown into the mill.

See Sir Daniel Wilson's Archeology and Prehistoric Antiquities of Scotland (1853), and Sir Arthur Mitchell's The Past in the Present (1880).

Quesnay, FRANÇOIS, a great French economist, was born at Arques, near Montfort-l'Amaury, June 4, 1694, studied medicine and philosophy at Paris, and in 1718 commenced practice at Mantes. He acquired a high reputation in his profession, and at his death on 14th December 1774 was first physician to the king. But the fame of the 'European Confucius,' as he was called by his followers, depends upon his speculations in political economy, in the pages of the famous Encyclopédie (articles 'Fermiers' and 'Graines') and various serials. Around him and his friend, M. de Gournay, gathered the famous group of the Economistes, also called the Physiocratie School (q.v.; and see Politicians Economists, p. 288). Quesnay's views were systematically set forth in a little treatise, entitled Tableau Économique. Only a few copies of this work were printed about the end of the year 1758, and these have now all disappeared; yet the principles maintained by Quesnay are well known, both from the sources above mentioned, and from other treaties that have met with a better fate—his Maximes Générales du Gouvernement Économique d'un Royaume Agricole, the notes to which occupy more space in the last edition; and also the famous section included in the Physiocratie of Dupont de Nemours; Analyse du Tableau Économique; Problèmes Écono-

miques; and Dialogues sur le Commerce et sur les Travaux des Artisans—collected in Oncken's edition of his Oeuvres Économiques et philosophiques (Frank-

fort, 1888).
Quevedo, Pasquier, a French theologian, was born at Paris, July 14, 1634, and, after a distinguished course in the Sorbonne, entered the Congregation of the Oratory in 1650. His great work was his reputation for learning and piety that at the age of twenty-eight he was appointed director of the Paris house of his Congregation. It was for the use of the young men under his care that he commenced the celebrated series Réflexions Morales sur le Roman de Quevedo. In 1684 he published an edition of the works of Leo the Great, in which the notes was held to maintain Gallissianism (see GALLICAN CHURCH), and was accordingly placed on the Index. Having refused to subscribe the formulary condemnatory of Jansenism required by a decree of 1684 from all members of the Oratory, Queuel saw himself compelled to flee to the Low Countries, where he attached himself to Arnauld. He continued at Brussels his Réflexions, which were published in a complete form, with the approval of the Cardinal de Noailles, Bishop of Châlons, and ultimately Archbishop of Paris (1693-94). The Jesuits were unceasing in their malignant hostility, and Queuel was denounced and flung into prison, but escaped to Holland. His book was finally condemned in 101 several propositions by theindex bull Unigenitus (1713). Queuel spent his last years in Amsterdam, where he died December 2, 1710. A complete list of his many books will be found in Moréri's Dict. Hist. His Letters were edited by Le Courayer (1721-23). For the later history of Jansenism, see Séehe, Les Dames Jansénistes (1891).

Quetlet, Amhert Adolphe Jacques, a celebrated Belgian statistician and astronomer, was born at Ghent, 22d February 1796, and studied at the lyceum of his native city. Here at eighteen he began to teach mathematics, and five years later was appointed to this chair at the Brussels Agricultural School. He superintended the building of the Royal Observatory, and became its director in 1828, while in 1836 he accepted the chair of Astronomy and Geodesy at the Brussels Military School. From 1834 he was perpetual secretary of the Belgian Royal Academy. He died 17th February 1848. His scientific work lay mostly in the regions of meteorology and statistics; and, in the last, to anthropology. His greatest book is Sur l'Homme et le Développement de ses Facultés (1835), in which he sums up his researches on the physical and intellectual qualities of man. Both in this and in later works In Commissie Centrale de Statistique, in l'Anthropométrie et en Droïne des diverses Facultés de l'Homme (1871), and in other books and papers he shows the use that may be made of the theory of probabilities, as applied to the 'average man'—at times carrying out that notion so as to arrive at a mechanical precision not justified by facts, and rejected by later writers on 'mind statistics.' Quetlet's contributions to meteorology, astronomy, terrestrial magnetism, &c., in the Mémoires and Bulletin of the Belgian Royal Academy, were numerous and important. See Maitland, Historical Essays on the Travaux de Quetlet (1875), and Wolowsky's Etude (1875).

Quetzaltenango, the second city of Guatemala, the capital of a department of the same name, is on the Sigüla, 95 miles W. by N. of Guatemala city. It contains an ornate church, the Madame, government buildings in the republic, a national college, and a conservatory are lit with the electric light; the houses are built of a light-brown lava from the Cerro Quemado ("Burned Mountain"), which overlooks the city. Quetzaltenango is the centre of the trade in native cottons. The nearest port is Chamepier, on the Pacific, from whence a railway extends to Zitakultulle (27 miles). Pop. 20,000. mostly Indians.

Quevedo Villegas. Francisco Gomez de, was born at Madrid in 1580. His father was secretary to the queen and his mother one of her ladies in waiting. The Quevedos were one of the old families of the Montaño, the mountain-region between Burgos and Santander. The name was no doubt derived from a place on the Besaya river, but the punning motto of the scutcheon on their house in the adjacent Toranzo valley, "I am he who stopped—el que vedó—the advance of the Moors," expressed the family tradition, and, like that of the Spanish de Vega, Calderon, and others of the race, Quevedo was not a Moorish or a Nasrini, but an ancestry that claimed a share in stemming the tide of Moslem conquest. Villegas was the name of his grandmother's family, another of the same mountain stock. He was left an orphan at an early age, and sent by his guardian to the university of Alcalá, from which he came away with such a name for varied scholarship that he may be said to have entered upon life with a reputation ready made. Apparently a quiet, studious, meditative life would have been his own choice, but chance overruled this wish for him. Being during a vital issue of a duel, brought about by his chivalrous chivalry of a woman who had been insulted in his presence, drove him in 1611 to the court of his friend the Duke of Osuna, the new viceroy of Sicily; and, perceiving in Quevedo, poet, scholar, as he was, the capacities of an able administrator for him, he made him his right-hand man, and kept him constantly employed in confidential missions to Rome, Milan, Genoa, and Venice, and when promoted to the vice-royalty of Naples, chose him as his minister for finance, a place in which Quevedo's success was only equalled by his industry.

He was involved in the fall of Osuna in 1619, and kept in prison for a time, but there was in fact nothing to tax him with except fidelity, and he was permitted to retire to La Torre de Juan Abad, a small estate of his in the Sierra Morena; he was allowed, however, to return to Madrid in 1623, and became a persona grata at the court of Philip IV. In 1626 he published his most important work, the Politica de Dios, sketched probably in Italy, but put into shape during his banishment. He had no fear of a ten years behind the scenes, and watched the working of one-man-rule in its worst form under the autocracy of the Duke of Lerma, and in the Politica he made an earnest and eloquent appeal to the king to be a king, not in name only, but in fact. "The heart of the king," he said, "must be in no hand but his." Probably it would be difficult to see the light had Philip IV. been true to the promise of his youth; but he soon grew weary of governing, and left it to Olivares, and so long as Olivares remained in power Quevedo's book continued to be a popular one. In 1628 he followed up his attack on government by fugitives in an essay on RELIGIOUS REFORMED. He remained, however, on friendly terms with Olivares; and if honours and high
place could have tempted him he might have had anything in the minister's gift. He would have been a valuable but trustful an unstable regime, and it was desirable to silence a man who had an awkward knack of telling the truth in a way that brought it home to the public. But Quevedo had better things to do. His first love was poetry, and the sensation that he could be got to accept was the purely honorary title of secretary to the king. In the winter of 1639 another way of effecting his purpose presented itself to Olivares. A memorial in verse to the king, imploring him in respectful and loyal language to remove his rival, and the condition of his kingdom, was one day placed in his napkin on the royal table. Quevedo was demoted as the author (and no doubt he was, though his biographer, Dr de Tarsia, strives to disprove it), and was arrested at night and carried off to the convent of San Marcos at Leon, where, heavily ironed, he was lodged in a cell below the level of the river that washes the convent wall. He was soon struck down by an illness, brought on by cold and damp, from which he never recovered. He was not released till the year 1643, and then went home to La Torre to die; but the next year his sufferings became so acute that he had to move to Villanueva de los Infantes for medical aid, and there death released him in September 1645.

Quevedo was one of the most prolific Spanish poets, and was ranked by his contemporaries with Juan de Mena, Garcielas, Lope, and Gongora; but he wrote no poetry for the world. His verses were all written for his friends or for himself, and, except those in the Flores de Espinosa (1663), the few pieces published in his lifetime were printed without his consent. Poetry was with him a recreation and a solace, and, according to his nephew, some of his gayest and brightest verses were written in his cell at San Marcos. His poetry was more than that of his predecessors dramatic character, and to a great extent made up of what would now be called vers de société; sonnets, sermons, and satirical, form a large portion of it, and light humorous ballads and songs a still larger. His more ambitious work is at times disfigured by extending the work of his predecessors, and poems he once would write. All through life he was at war with the poets of the 'Culto' school, Gongora and his followers ('the scourge of silly poets' Cervantes called him), and this perhaps may have made him chary of appearing in public as a poet; but if he took no pains to place himself upon the roll of Spanish poets, he added to it the name of Francisco de la Torre, whose poems he discovered and published in 1631. It was for a long time maintained that the discovery was a pretended one; but it is now admitted that he could not have been the author of his verses. His first book was a life of St Thomas de Villanueva in 1629 and his last, in 1644, a life of St Paul; and the greater part of his prose is of the same character, as is indicated by the titles: The Patience and Constancy of Job, The Oraible and the Grave, Virtue Militant, The Martyrdom of Marcus Musculo, Instruction how to Die, The Introduction to Devout Life, from St Francis de Sales, and others of the same kind. Of his political works the Politica de Dios is the chief; but he also wrote a Life of Marcus Brutus, to which he was adding a second part when struck down by his last illness, a Letter to Louis XIII., on the war of 1635, and several shorter tracts. In 1626, at Saragossa, his brilliant picaronsque novel, the Vida de Manuel de Cervante, was printed, and after his death, the Gran Tucano, was printed, apparently, like most of his books, without his permission, and at once took its place beside Guzmam de Alfarache; and in 1627 his great Visions, four of which had been written between 1607 and 1615, and the rest between 1622 and 1624, were printed in the same way at Barcelona. His friend, Vander Hammen, immediately printed three of them at Saragossa from his own copies, and added the Casa de los locos de Amor (The Madhouse of Lovers), which has ever since been wrongly attributed to Quevedo. He himself disowned it; it bears no trace of his hand, and it is not printed as his by Vander Hammen, who, moreover, afterwards confessed himself the author. Chiefly for the sake of the vision or apologue of the Politica de Dios, the first edition, which did not affect the Politica de Dios, he wished the Visions to appear in an authorised edition at Madrid; but unhappily they were submitted for examination to the Padre Niseno, a friend of Montvalan, the dramatist, who had a grudge against Quevedo, and very nearly succeeded in obtaining a condemnation of the whole. It was, however, permitted, and the mutilations of his work which in some places make utter nonsense of it; and it is in this mangled shape the Visions have been printed ever since 1631. He added some short humorous pieces, on the affectations of the Culto school, the use of vulgar slang; phrases, silly rhymes, and the like; and better to mask the designs of the others, he called the volume Juguetes de la Niñez (Playthings), and apologised for the whole as the work of his youth, though the principal piece was written only three years back. The vision or apologue was Quevedo's favourite form of expression; his peculiar humour and satire are nowhere better seen than in Fortuna con Seco (Fortune Right), written in 1635, but not printed till 1650, in which Fortune demonstrates by example that if strict logic and justice took her place mankind would have a great deal more to complain of.

The edition of Quevedo's works in the Biblioteca de Autores Españoles (vols. xxiii. and xxiv., prose, edited by Aureliano de la Fuente, and also by Florencio Janer) is the only one that can be said to approach completeness. Many of the pieces in it are printed for the first time. The prose is edited with commendable thoroughness and industry; but Sehor Fernandez-Guerra has unfortunately preferred the expurgated text of the Visions to that which came direct from the hand of Quevedo; he gives, however, the most important of the variations in his notes. The volume of verses is less satisfactory, and follows the stupid pedantic arrangement of the 17th-century editors. After Quevedo's death editions followed in quick succession, but most of them are slovenly in the extreme as regards editing, paper, and print. A handsome edition in 3 vols. 4to was issued by Foppens (Brussels, 1660-71), and well printed, if not critical ones by Ibarras (Madrid, 1648), by Sancha (11 vols. 8vo, Madrid, 1791-94), and by Castellana (5 vols. 8vo, illustrated, Madrid, 1841-45); and an admirable selection (which in Quevedo's case is not only a defensible but a desirable form) was published by Villalpando in 1798 (4to). The earliest translations from Quevedo were into French by the Sieur de la Geneste, who translated the Politica de Dios in 1653, the Hell Reformed in 1654, and the Vida de los Inocentes, to Robespierre in 1653, or 1641 according to Brunet. His versions are by no means faithful or accurate, but they have the advantage of being based upon Quevedo's original text. From them most of the English versions have been made—e.g. Visions; or Hell's Kingdome, by R. Crotshawe (1640); Hell Reformed,
Quiberon, a small fishing-town of France (dept. Morbihan), at the extremity of a long narrow peninsula, 21 miles SW. of Vannes. Pop. 1036. It was here that a body of French enfraged royalists landed from an English fleet in 1705, and endeavoured to raise the people of Brittany and La Vendée against the Convention. They were defeated and driven into the sea by General Hoche. Nearly all the prisoners taken were shot by order of the Convention. On 20th November 1759 Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay.

Quichua, the language of the Indians of Peru (q.v.).

Quick, Robert Hervert, was born in 1832, had his education at private schools and at Harrow, whence he passed to Trinity College, Cambridge. He took orders, held curacies in Whitechapel and Marylebone, and was appointed by his college to the vicarage of Sedbergh in 1883, but four years later resigned the living. He had an intense love of children, and the great interest of his life was education. To the discussion of its theories he brought wide study, independent thought, and ripe wisdom; witness his bright and delightful Essays in English Literature (1886); 2d ed. (1899). His practical knowledge of the work of teaching he had gained by service at Cranleigh, Harrow, and elsewhere. He died at Cambridge, 9th March 1891.

Quicks. See Couch-grass.

Quicksand (quick—i.e. ‘living’ or ‘moving,’ and wind), in its usual significance, a tract of sand which, without differing much in appearance from the shore of which it forms part, remains permanently saturated with water to such an extent that it cannot support any weight. Quicksands are most often found near the mouths of large rivers. They appear only to be formed on flat shores, the subsoil of which is an impervious mass of gravel, clay or other impervious formation. Pools of water are retained in the hollows, and become partially filled with sand or mud, which remains like the soft sediment in a cup of cocoa on account of the absence of drainage. The sand on a uniform shelving shore consists loosely; overlying sand, which sinks and takes up water when impervious it drains back freely to the sea. In narrow channels through which the configuration of the adjoining shore causes strong tidal currents to run the sand may be kept so constantly stirred up by the moving water that a quicksand results. The body of seaweed, usually at some distance from a gentle slope is usually firm, the hollow margin of the bank where it meets the shore is frequently a quicksand. Quicksands are not common of great extent, and their danger has probably been exaggerated in the popular mind by sensational descriptions in works of fiction—e.g. in the British author, M. Moonstone. Persons sink in a quicksand exactly as in water, only more slowly; and it is probable that if the victim did not struggle he would not sink over the head, as experiments show that water containing a quantity of solid matter in suspension has its floating power increased. With a commotion of quicksand and the belief amongst sailors that if a vessel is stranded on a quicksand it is inevitably sucked down. This cannot be the case unless the vessel springs a leak, or heels over sufficiently to let the semi-liquid sand enter. The idea may have taken rise from the popular notion that a boat of quicksilver, or from the fate of small vessels stranded at low tide on a stiff bank of clay which held them fast and allowed the rising tide to submerge them.

The name quicksand is sometimes applied, especially by old writers, to the drifting sands which are carried by wind over cultivated land bordering the seashore or a desert. See Downs, Drift, Dunes. Quicksilver. See Mercury.

Quietism, a name given to a tendency shown at various periods in the history of the church by many classes of mystical religious enthusiasts, of widely different beliefs, to make perfection on earth consist in a condition of uninterrupted contemplation. In this state of contemplation it is the soul's reason, to reflect either on itself or God, or to form any of the ordinary acts of faith, its sole function being passively to receive the infused heavenly light which accompanies this state of inactive contemplation. The first of modern Quietists was the Spanish priest Molinos; his most famous disciple, Madame Guyon, whose gentle but powerful influence led into the same mode of thought the saintly Fénelon. Quietism has been called the Spanish analogue of Quakerism in England, of Jansenism in France, of Pietism in Germany; but these several systems, though they had common tendencies, were also sharply distinguished. It may be said that Quietism involves but little of practical consequence, whether for good or for evil. This may and does hold true in the case of noble and lofty souls like Fénelon; but what moved Molinos, what gave the name of Quiets to the aforesaid Madame Guyon, was the belief that, carried to its logical conclusion, Quietism led to Antinomianism, and would inevitably prove pernicious in its effects upon the vulgar crowd of followers. From the belief of the lofty and perfect nature of the purely passive state of contemplation there is, it was held, but a single step to the fatal principle in morals, that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; that good works, the sacraments, prayer, are not necessary, and hardly even compatible with the repose of the soul; that so complete is the self-absorption, so independent is the soul of corporeal sense, that even criminal representations and movements of the sensitive part of the soul, and even the external actions of the body, fail to affect the contemplating soul, or to impress it with their dehasing influence. See Bossuet, Fénelon, Guyon, Molinos; also Hoppe, Geschichte der quietistischen Mystik in der Kathol. Kirche (1875).

Quirgh. See Fillan (St.).

Quillimane, a seaport of East Africa, in the Portuguese territory of Mozambique, stands about 15 miles from the mouth of the river of the same name, the northern arm of the Zambezi delta. The town stands on a sand-bank inhabited by native cottons, beads, hardware, arms, coal, spirits, and food-stuffs to the annual value of £60,000, and exports ivory, ground-nuts, India-rubber, wax, copal, and oil-seeds to a value that ranges between
Quillota, a town of Chili, in the fertile valley of the Aconcagua, 13 miles from its mouth, and 25 miles by rail NE. of Valparaiso. Pop. 6000.

Quills are the large feathers of the wings of birds, certain kinds of which have for centuries been used in writing pens. From the swan, goose, and turkey the kinds are obtained that are regularly prepared for writing purposes, crow quills being used for drawing. A quill, like horn or hair, is formed of epidermic tissue, and the barrel or tube (the quill proper) has an external membrane and an internal pit. In order to get rid of these, and to bring the naturally soft state of the barrel into a condition ready for making into a pen, it requires to be dressed. The quill-dresser sits beside a fire enclosed with brick sides and with an iron plate in front, containing a hole somewhat at the west coast, 33 piece. He first heats the quill by placing it for one or two seconds in this hole, which enables him to scrape off the outer membrane with a thick strong knife, the quill being pressed nearly flat in the face. This done, he again holds it for a brief time in the furnace, in which the quill acquires the proper strength and brittleness to admit of its being made—by a knife or machine—into a pen with a clean slit. Quills were formerly prepared for writing by another process, which is still used for such as are made into toothpicks. This consists in steeping them for a night in water and then manipulating them in hot sand. Although the manufacture of quill-pens is a declining industry, they are still made in considerable numbers. The Controller of the Government Stationery Office, thinking the matter of some public interest, published between 1863 and 1873 a yearly statement showing the numbers of steel pens and quills supplied for the public service. These reports show that as late as the year 1868 there was still a large number of quills used. The figures are: quills, 4000 gross; steel pens, 14,942 gross, value £1900. These figures did not materially differ for the four previous years, but in 1873 the annual number of quills supplied had diminished by nearly one-half. In the quantities issued from the Stationery Office were: Quills, 4000 gross; steel pens, 38,000 gross.

Quilma, or Kilwa, a seaport of East Africa, in German territory, 100 miles S. of Zanzibar, and an outlet for the trade with Nyassaland, exports ivory, gum copal, rice, and manioe. Pop. 6000, including a number of Banyans.

Quilon, or Kilwa, a town of Southern India, in the state Travancore, is connected with the west coast by the NW. of Cape Comorin. A settlement of the ancient Syrian Church and subsequently of the St. Thomas Christians, it was, under the names Coilon and Columbura, a famous mart for the trade in timber, ginger, pepper, &c. The Portuguese built a fort there in 1505, which the Dutch took in 1653. From 1683 to 1830 it was garrisoned by the British. Pop. 13,588.

Quimper, a town of France (dept. Finistère), is prettily situated on the Odet, 11 miles from its mouth, and 63 miles by rail SE. of Brest. Its cathedral (1239-1515), a stately and richly-carved and ornamented edifice, is the principal building; there are also a college, a museum, and an agricultural school. Pottery is in operation, as well as tanneries, sailworks, &c.; and fishing is carried on. Pop. (1872) 13,159; (1891) 17,406.

Quin, James, a celebrated actor, was born in London, of Irish descent, 24th February 1693, and made his first appearance on the stage in 1714 at Dublin. Shortly after he proceeded to London, where he was engaged at Drury Lane, but for quill inferior parts. In 1716, however, the sudden illness of a leading actor led to Quin's being called on to sustain the character of Rajzat in the once famous play of Tamerlane. His success was marked. Next year he exchanged Drury Lane for Rich's Theatre in Fleet-street, where he remained as a principal actor for seventeen years. Not long after leaving the former place he had the misfortune to kill a brother-actor in a duel—a circumstance which clouded his reputation for a while. The only real fine parts which he seems to have played were Captain Macheath in the Beggar's Opera and Fairstaff in the Merry Wives of Windsor. In 1734-35 he returned to Drury Lane Theatre, 'on such terms,' says Cibber, 'as no hired actor had before received,' and from this date until the appearance of Garrick in 1741 he was by universal consent the first actor in England. In 1746 Quin and Garrick acted together in the Fair Penitent, as a contest for pre-eminence. The novelty of seeing the two rival actors in the same tragedy, and the admirable acting of Mrs. Cibber as the Fair Penitent, contributed greatly to the extraordinary success of this play. The superiority of Garrick was acknowledged by the best judges; and Quin, by no means pleased at his rising fame, sarcastically declared that 'Garrick was a new religion, and that Whitefield was followed for a time, but they would all come to church again.' In 1751 he withdrew from the stage, and fixed his residence at Bath, where he died, January 21, 1766. In society Quin was also popular, his conversation being full of wit and his stories amusing though coarse. He had a most benevolent heart, and among his many charities he made an endowment of £1900 a year to give a great service to Thomson by delivering him from arrest, and afterwards lived 'in fond intimacy' with the poet, as Johnson tells us in his Lives of the Poets. An anonymous Life of Quin, dedicated to Garrick in 1776, was reprinted in 1887, with a supplement of corrections and additional information.

Quince (Cydonia), a genus of trees and shrubs of the natural order Rosacea, sub-order Pomeae, nearly allied to Pyrus, with which many botanists have united it under the name P. Cydonia, but this does not distinguish it from the true quince, an agreeable fruit, in each cell, and by their very mucilaginous nature. The Common Quince (C. vulgaris), a native of the south of Europe and temperate parts of Asia, is a low tree, with generally tortuous branches, ovate, entire, deciduous leaves, and rather large white flowers, which are solitary at the extremity of young branches. The fruit is in some varieties globose, in others pear-shaped, of a rich yellow or orange colour, with a strong smell. It is hard and austere, but when stewed with sugar becomes extremely pleasant, and is much used in this way either by itself or to impart a flavour to apple-pies. It is also much used for making a preserve called Quince Marmalade. A delicious beverage somewhat resembling elder is made from it. The seeds, which readily give out their mucilaginous matter, so that fifty or sixty times their amount of water into a substance as thick as syrup, have long been used in medicine. Quince muelagre or quince gum, Cydonia, is allied to Bassorin, but differs from it in being readily soluble in water (see GUM). The quince is also cultivated in Syria and Romans, and is at the present day cultivated in the south of Europe, in England, and generally in temperate climates. Its principal use in Britain
Quincy, DE. See De Quincy.

Quincy, (1) the third city of Illinois, and capital of Adams county, is on the Mississippi River, 160 miles above St. Louis and 262 by rail SW. of Chicago. It is handsomely built on a high bluff, has a large trade by the river and extensive railway connections, an important railway bridge crossing the river at this point. The public buildings include a fine court-house, a medical college, several hospitals and asylums, an Episcopal cathedral, and some forty other churches. The city has many large flour-mills, machine-shops, foundries, saw- and planing-mills, breweries, and manufactories producing stoves, furniture, carriages, tobacco, &c. Pop. (1850) 31,494; (1890) 36,252. (2) A town of Massachusetts, near the sea, and 8 miles S. of Boston by rail. The town-ship produces the famous Quincy granite, and was the birthplace of John Hancock, John Adams, and his son, John Quincy Adams. Pop. (1900) 23,899. Quincy city is co-extensive with the town.

Quincy, Josiah, an American orator and man of letters, and son of Josiah Quincy (1744-75), an eloquent advocate of the rights of the colonists, was born at Boston, February 4, 1772, graduated at Harvard in 1790, and was called to the bar in 1793. He took an active interest in politics as a leading member of the Federal party in New England, and was elected in 1804 to congress, where he became distinguished as a ready, earnest, and fervent orator. He was one of the earliest to denounce slavery, but his most remarkable speech was one in which, spurred on by the jealousy with which the old New England colonies regarded the new western states, he declared that the admission of Louisiana would be a sufficient cause for the dissolution of the union, and that, as it would be the right of all, so it would be the duty of some, to prepare definitely for a separation—peaceably if they could, violently if they must. Disgusted with the triumph of the Democratic party and the war of 1812, he declined a re-election to congress, and devoted his attention for a while to agriculture.
made the blow he struck the order the deadliest it had received in France since the days of Paseau. But his lectures caused so much excitement that government suppressed them in 1846. Next came the Revolution, in which Quinet took his place on the right. He had been elected to represent Ain in the National Assembly, where he voted in the Extreme Left. He was little of a practical statesman, but from the beginning he saw the traitor under the mask of Louis Napoleon. After the coup d'état he was exiled to Brussels, whence again was himself to Veytaux on the shores of the Lake of Geneva. His mother had died in 1847, his wife in 1851, and so soon after his exile he married the daughter of a Roumanian patriot, Georges Asakly. At Brussels he produced Les Esclaves (1853), and an edition of the chief writings of Marigny de Ste Aldegonde (1856); and in Switzerland Merlin l'Enchanter (2 vols. 1860), a book of enormous rhetorical power, lofty but ill-sustained thought, and dazzling imagery. Other works were La Révolution Religieuse au XVIIIe Siècle (1857) and L'Épitaphe (1869) - a delightful fragment of an autobiography; Histoire de la Campagne de 1815 (1862), in which he showed that Napoleon's fall was due to his own outrage upon righteousness alone; La Révolution (1865), in which he demonstrated that its frightful crimes were in no sense inhuman or unjustified, but begotten by twelve centuries of despotic education. All the disasters of French history he traced to the national denial of righteousness in the Revocation of the Edict of Nantes; the Terror was the direct result of St Bartholomew and the Dragonnales, and again it was the parent of the 18th Brumaire and the 2d December. After the downfall of Napoleon III. he returned to Paris, and during the siege strove to keep aglow the expiring fire of patriotism. He sat in the National Assemblies at Bordeaux and Versailles, and inspired great enthusiasm by his impassioned if somewhat vague orations. He died at Versailles, 27th March 1875.

Quinet's last books were La Création (1870), a characteristically bold and imaginative incaution into the domain of science; La République (1872); and L'Épitaphe (1874). Le Livre de l'Enfant appeared posthumously. His wife published in 1870 Mémoires d'Exil; his Correspondance Inédite followed in 1877 (2 vols.), his Lettres d'Exil à Michel et à Divers Amis in 1844-46 (4 vols.), an edition of Frederick's Complete Works in 26 vols. (1857-79) was prepared by an influential committee as a national tribute of respect to the poet, the prophet, and the patriot. See his biography by Charles Quinet (1880), his widow; Richard Heath's Edgar Quinet; His Early Life and Writings (1881); also the essays by Professor Dowden in Studies in Literature (1878), and E. Montégut in Mélanges Critiques (1879).

**Quinine** is an alkaloid having the chemical formula C_{18}H_{24}N_{3}O_{8}·3H_{2}O. Along with cinchonine, dihydrocinchonine, and a large number of other alkaloids, it is present in the bark of numerous species of Cinchona and Remijia, of which these subgenera are definitely the most important. Good barks yield an average of 5 to 6 per cent, total alkaloids, of which one-half is quinine and cinchonidine, the other half consisting of the other alkaloids in varying proportions. Quinine is by far the most important from a medical and commercial viewpoint, and the acetate and hydrochlorate are the most important commercial products. Good barks yield somewhat greater than 14 and 8 per cent, being the extremes. Quinine is obtained from the powdered bark by treating it with lime, and then extracting the mixture with alcohol, neutralising with an acid so as to obtain a salt of quinine, and finally purifying with carbon dioxide. In 1914, Cawthron and Cavendish isolated pure quinine, and demonstrated that it was the chief active ingredient in the bark. Many attempts have since been made to prepare it artificially, but without success. For the introduction of the bark into Europe, and the culture of the tree in South America and (recently) in India, see Cinchona.

Quinine itself is not used in medicine, owing to the inconveniences arising from its insolubility in water, but the hydrochlorate, or salt of quinine, and the sulphate and hydrochlorate, are included in the British Pharmacopoeia along with numerous preparations of cinchona-bark containing them. The sulphate is the most commonly used preparation, and it is popularly known as quinine. It occurs in small prismatic crystals which have a purely and intensely bitter taste, and are sparingly soluble in water (1 in 700 parts); its solutions have a bluish or fluorescent colour even when very dilute. In alcohol or dilute sulphuric acid it is very soluble. The hydrochlorate closely resembles the sulphate, but is much more soluble in water (1 in 34 parts), and its solutions are not fluorescent. When treated with excess of chlorine water and a few drops of ammonium solution, solutions of quinine give a clear emerald green colour; if ferrous ammonium carbonate be added this changes to a ruby red.

Preparations of quinine, and especially the sulphate, are very largely used in medicine. Locally applied dilute solutions (2 to 4 gr. to the oz. of water) have a germicidal, antipretective, and antifibrinolytic action, and prove useful in the treatment of ulcers in bay fever, dyspepsia, diarrhoea, and similar diseases. As a bitter tonic small doses (1 to 2 grains) are frequently given in general debility, atonic dyspepsia, anemia, scorbutis, convalescence from acute diseases, and other conditions where tonic treatment is required. It is also of great value as an antipyretic and antiperiodic. In healthy persons it does not reduce the bodily temperature, but in typhus, typhoid, rheumatic, and some other fevers it is extremely valuable in this respect. A dose of 5 to 15 grains may be given in these cases. In fact, it does not reduce temperature. In malarial affections of all kinds it is supreme, and at present no other known drug can compare with it in efficacy. In intermittent fevers and ague the best plan is to begin its administration about eight hours before the attack is expected, and continue it in hourly doses for three or four hours until 15 to 30 grains have been given. It cuts short or aborts the recurring febrile attacks. It is also of great value as a prophylactic in persons who are exposed to the risks of malarial poisoning. In cases of dropsy the twice daily dose is usually considered a sufficient dose.

Quinine is also largely given in neuralgia and in inflammations. Large doses are very apt to irritate the stomach, and sometimes produce a train of symptoms known as cinchonism. There is stinging in the ears, dizziness, deafness, a feeling of fullness in the head, and disturbance of vision—all of which usually pass off without leaving any ill results. In some cases the effects are more severe, and may lead to dangerous depression and collapse, especially if the patient be already weakened by disease. Certain persons are very susceptible to the action of quinine, and suffer from cinchonism after small doses. In others skin eruptions, edema of the face, irritation of the bladder and kidneys, and other disagreeable effects are sometimes seen. Workers in quinine factories also occasionally suffer from skin eruptions. These accidents are, however, comparatively rare.

The sulphate of cinchonidine and sulphate of cinchonine are also included in the British Pharmacopoeia, but are very much less used. They seem, however, to be efficacious, and are cheaper.

See works by J. E. Howard (1876), C. R. Markham (1880), Mansuy (1882), and Flückiger (1894).
Quinoa (Chenopodium quinoa), a valuable food-plant, a native of Chili and the high table-land of Mexico, which much resembles some of the British species of Chenopodium (q.v.). In the countries in which it is indigenous it is much cultivated for its seeds, which form a principal food of the inhabitants. The meal made from some seeds is red, giving to the dish a peculiar flavour, but it is very nutritious and is made into a kind of porridge and cakes. The plant is sometimes cultivated in British gardens for its leaves, which are a good substitute for spinach.

Quinoline, a pungent colourless liquid obtained by the distillation of bones, coal-tar, and various alkaloids, is a base of the organic bodies, and is isomeric with Lecyn (q.v.).

Quinquagesima (Lat., 'fiftieth'), the Sunday immediately preceding Ash-Wednesday. The common explanation of the name Quinquagesima, and of Sexagesima and Septuagesima, the two preceding Sundays, is that the Sundays are, roughly speaking, about fifty, sixty, and seventy days respectively before Easter. Quinquagesima, indeed, is exactly fifty days before the Octave of Easter—i.e. Low Sunday (q.v.). But probably the terms were adopted without any intention of expressing delineated periods and simply in analogy with Quadragesima, the Latin name of Lent.

Quinquernae, vessels with five banks of oars, however arranged (see TRISKME), may be regarded as the first-rates of the ancient navies.

Quinsy (originally squinancy; Fr. quinquanie; from Gr. kynaneia, known also as Cynanche Tonsillaris and Tonsilitis, or as 'inflammatory sore throat,' is an inflammatory affection of the sub-stance of the tonsils attended when fully-developed by suppuration (see PALATE). The inflammation is seldom limited to these glands, but extends to the uvula, the soft palate, and the pharynx. The disease usually manifests itself by difficulty in swallowing, and a sense of heat and discomfort in the throat, often amounting to considerable pain. On examination the throat at first exhibits unnatural redness, with enlargement of one or both tonsils. The uvula is enlarged and elongated, its end either dropping down into the pharynx, and, by exciting the sensation of a foreign body, giving rise to much irritation, or else adhering to one of the tonsils. The tongue is usually furred, and the pulse rapid, and there are the ordinary symptoms of that form of constitutional disturbance known as inflammatory fever. The inflammation terminates either in resolution (if the attack is not severe, and yields readily to treatment) or in suppuration, which may be detected by the occurrence of slight rigors, and by the increased softness of the enlarged tonsil. The matter which is discharged has sometimes a very fetid smell, and the fetor may be the first indication of the rupture. The pulse becomes the chief sign of the discharge of matter, and recovery is then rapid. The disease usually runs a course of from three to seven days: but it may be prolonged if, as sometimes happens, the two sides are successively affected. It almost invariably terminates favourably. It is most common between the ages of fifteen and twenty-five. The ordinary exciting cause of this disease is exposure to cold, especially when the body is warm and perspiring; and certain persons (or even families) are so subject to it that slight exposure is almost sure to induce it.

The patient should remain in bed, or in the house (or, in cold weather, even in bed), and should be kept on low, non-stimulating diet. According to Sir Morell Mackenzie, the best treatment at the commencement of the attack consists in the administration of quinine. He gives it in the form of lozenges, each containing three grains, and one to be sucked every two hours, and states that by this means the disease may generally be averted. Baking soda (bicarbonate of soda) applied to the affected part on the tip of the forefinger every hour or half-hour often has the same effect. In more severe cases the patient may gargle frequently with lukewarm water, and apply hot poultices or fomentations to the side of the neck. Blistering and leeching will sometimes give relief, but if suppuration is once established they do harm rather than good. If the tonsils are very much enlarged they should be prickled with a lancet to let the blood flow.

Quintain was an instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post, surmounted by a cross-bar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilt was to strike the board at such speed that he would be well past before the bag of sand, as it whirled round, could hit him on the back. At Offham in Kent, 7 miles WNW. of Maidstone, there are the remains of an old quintain; and at the May games held at St. Mary Cray in Kent, near Bromley, in 1891 the quintain was also revived.

Quintal, a French weight corresponding to the English 'hundredweight,' was equal to 100 pounds (livres); on the introduction of the metric system the same name was employed to designate a weight of 100 kilogrammes (see GRAME). The metric quintal, equivalent to 220 lb. avoirdupois, is thus more than twice as heavy as the old one.

Quintana, Manuel José, whose patriotic odes obtained for him the surname of the 'Spanish Tyrtæus,' was born at Madrid, 11th April 1772, studied at Salamanca, and established himself as an advocate in his native city, where his house became a resort of the advanced liberals of the time. Besides his Spanish Plutarch (Vidas de los Españoles Celebrés, 1807-34), a work which is reckoned one of the finest Spanish classics, he published one or two tragedies, and an excellent selection of Castilian poetry. On the restoration of Ferdinand VII. in 1814, his adherence to the exiled liberals caused his imprisonment for six years; but he ultimately forced the liberal cause, held office, and died 11th March 1857.

Quintett, a musical composition for five solo voices, or for five instruments, each of which is obbligato. Quintets for strings have been written by Beethoven, Schubert, Mozart, Schumann, Brahms, and Raff. Of vocal quintets one of the most notable is that in Wagner's Meistersinger.

Quintilian. Marcus Fabius Quintilianus was born about A.D. at Calagurris (Collabria), in Spain, and attended in Rome the orations of Domitius Afer, who died in 50. After this date however, he revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practise as a pleader in the courts, in which capacity his value was greatly appreciated by the new emperor, who was more distinguished, however, as a teacher than as a practitioner of the oratorical art, and his instructions came to be the most eagerly sought after among all his contemporaries, his pupils including Pliny the Younger and the two grandsons of Domitian. As a mark of this emperor's favour he was invested with the insignia and title of consul; while he also holds the distinction of being the first public teacher who benefited by the endowment of Vespasian, and received a fixed salary from the imperial
QUITO

His professional career as a teacher of eloquence commenced probably about 72, but after twenty years of labour as advocate and teacher he retired into private life, and died probably about 1534, possibly due to his great work entitled De Institutione Oratoria Libri XII., a complete system of rhetoric, which he dedicated to his friend Victorius Mareillus, himself a court favourite and orator of distinction.

It was written as he tells us in his preface to his second book after his five years of public teaching, and was the fruit of two years' labour. In the first book he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator, and he gives us an elaborate outline of the mode in which children should be educated in the interval between the nursery and the final instructions of the grammarian. The second book treats of the first principles of rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while that of the eighth, ninth, tenth, and eleventh is style (locutio), with memory and delivery. Of these the eighth and ninth discuss the elements of a good style; the tenth, the practical studies requisite: the rest are occupied successively with memory and delivery. The last, and in the author's view most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to be adopted, the age at which pleading should be begun, and at which it should be left off, and other allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, its elaboration of the theory of art, and the familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences has always been admired for its clearness, width of intellectual sympathy, and vigour. Quintilian's own style is excellent, for though he is not free from the love of florid ornament and poetical metaphor characteristic of his age, he was saved from its extremes by his good sense, which refused to sacrifice clearness and simplicity to effect, and still more, by his wholesome admiration for Cicero. The style of Seneca he found fully as offensive to the author as a whole; he denounced it as a dangerous model for the orator to follow. He makes an obvious effort to be fair in balancing his praise and blame, but a careful reader detects an undertone of dislike, whether toSeneca's philosophy or his person. Nineteen longer and 145 shorter Declamations (ed. C. Ritter, 1885), which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs.

The best edition of Quintilian's works is that of Bur- mard, a new edition, revised by Spanheim, completed by Zumpt and Bosnell (1798-1834), the last volume (vi.) containing a lexicon, Halm (1868-69), and the hand-edition by Meister (1866-87). Of Book x. alone there are editions by Professor J. E. B. Mayor (1792, incomplete), Hild (Paris, 1885), Froize (New York, 1889), and Principal Peterson (Oxford, 1891). There are English translations by Guthrie (1865) and the Rev. J. S. Waite (1848). See Karl F. Pfaundler, ein Lehrreiche aus der romanischen Kaiserzeit (1863), and C. Ritter, Die Quinlilianischen Declamationen (1881).

Quintus Curtius. See CURTIUS.

Quipu, the language of knotted cords which was used by the Incas of Peru previous to the conquest of their country by the Spanishiards. A series of knotted strings was fastened at one end to a stout cord; the other ends hung free. This was used for the purpose of conveying commands to officers in the provinces, and even for recording historic annals. The colours of the strings and the order of their arrangement, the character and number of the knots, their distance from the cord to which they were connected, and the methods of their interlacing were the principal elements in this "knotty language.

Quirinus (see Mars).—The Quirinal (Lat. Colis Quirinatis) is one of the seven hills of ancient Rome, which contains the Palatine and Capitoline, the oldest and most famous quarter of the city. For Quirites, also, see Rome.

Quisculus. See Grakle.

Qui Tam actions are actions so called in the law of England from the first words of the old form of declaration by which Informers sue for penalties, the plaintiff describing himself as suing as well for the crown as for himself, the penalty being divided between himself and the crown.

Quitch. See COUCH-GRASS.

Quito, the capital of Ecuador, and of the province of Pichincha, lies in 0° 14' S. lat., on the east side of the great plateau of Quito, at the foot of the volcano of Pichincha (q.v.), at an elevation of 9551 feet above the sea. Its site, cut up by numerous streets, is well planned, and the streets are laid out regularly at right angles, plunging into and scaling the sides of the valleys which come in their course. The city is well paved, but the sidewalks are very narrow; and the streets are generally clean, with only a few low thatched lamps—oftenst those placed before shrines at the street-corners. The appearance of Quito is very picturesque, and its beautiful environment of mountains, together with its clear, healthy, and temperate climate, maintaining an eternal spring, renders it one of the most charming cities of South America; yet the abrupt changes from the hot sun of mid-day to the chills of evening make pneumonia and diseases of the chest very common. The chief edifices are built of stone, the others of adobe or sun-dried bricks, covered with tiles. In the great square stand the quaint cathedral, with its green-tiled dome, the bishop's palace, the municipal building, and the capitol, built of brick and stucco, with wine-shops on the ground-floor and the two halls of congress on the third story. Other public buildings include the university, a seminary, an institute of sciences, an astronomical observatory, a museum, a library of 20,000 volumes, a penitentiary with 500 cells, a hospital with 500 beds, a lunatic asylum, a retreat for lepers, a score of churches, and three times as many monasteries. Most of these last are in a very dilapidated condition, for which it is hard to find any explanation but laziness; for they still retain their lands and revenues, and the offerings of the faithful, who are nearly all Indians, are as constant as ever. Indeed, Quito is the paradise of priests—of whom there are more than 400 in the city—and of the Spaniards. Since the conquest of Ecuador is the most faithful province of the pope, and the one state in the world which still refuses to recognise the unity of Italy and the condition of affairs that resulted from the occupation of Rome.

There are only two or three good shops, and no hotels; the daily market in the square before the monastery of San Francisco is the general purchasing-place, and the religious houses serve for hostels. The city boasts a telephone system, but water is still conveyed in great jars borne on the shoulders of porters. There is no manufactures in Quito; there are no card, woollens and beer; the drying of birdskins (humming-birds'), the copying of religious paintings, and the production of images of the Virgin and of saints rank as important industries. Founded in 1534, Quito has frequently
from earthquakes (especially in 1797 and 1854) and from revolutions. Finally in 1877 and 1883. Pop. about 50,000, mainly Indians and mestizos. See Monnier, *Des Andes au Pará* (1890); also Vincent, *Around and About South America* (1890).

**Quit Rent**, a term used to denote various nominal rents; properly speaking, a quit rent is a rent reserved in lieu of all services, because on paying it the holder of the land goes quit and free. In old records it is called white rent, because it was paid in silver money, as distinguished from corn rents. The Conveyancing Act, 1881, empowers an owner of land to redeem any quit rent to which it may be subject.

**Quo Vadis Sacra.** See Parish.

**Quoin** (Fr. coigne, from Lat. eneues) is generally a wedge or an angle. In artillery the quoin is a wedge inserted beneath the breach of a gun, for raising or depressing the muzzle. Quoin, in Architecture, is one of the stones forming the solid corner of a building. Where the work is of brick or small materials the quoins are usually of ashlar.

**Quoits**, a game much practised in many districts of Great Britain, seems to have been derived from the ancient game of 'throwing the discus,' which was such a favourite amusement of the Greeks and Romans. The discus was a circular plate of stone or metal, 10 to 12 inches in diameter, and was held by its farther edge with the right hand, so as to lean upon the forearm, and was cast with a swing of the arm, aided by a twist of the whole body. It was generally thrown edge foremost, and upwards at an angle of 45°, so as to give it as great a range as possible, and the player who threw it farthest was the winner. Sometimes a kind of quoit was used. The modern game of quoits differs very considerably from this. A quoit is a flatish ring of iron, generally about 8 inches in external diameter, and between 1 and 2 inches in breadth; the weight accordingly varies a good deal, but may in any match be fixed beforehand. The quoit is convex on the upper side, and slightly concave on the under, so that the outer edge curves downwards, and is sharp enough to stick into the ground. The mode of playing is as follows: Two pins, called 'hobs,' are driven into the ground from 18 to 21 yards apart; and the players, who are divided into two parties, stand at one hob, and in regular succession throw their quoits (of which each player has two) as near to the other hob as they can. The points are counted as in bowls or in curling. To facilitate the sticking of the quoits at the point where they strike the ground, a flat circle of clay—about 1 or 2 inches in thickness, and 15 feet in radius—is placed round each hob; this requires to be kept moist. The quoit, when to be thrown, is grasped with the right hand by one side, and pitched with an upward and forward jerk of the hand and arm, which give it a whirling motion, and cause it to strike the ground with its edge. Players acquire such dexterity in this game that they can very frequently 'ring' their quoit— that is, land it so that the quoit surrounds the hob.

**Quorn**, or Quorn Don, a village of Leicestershire, 21 miles SE. of Loughborough, gives name to a celebrated kennel (and hunt) of foxhounds. Pop. 1818. See Foxhunting.

**Quorra.** See Niger.

**Quorum** is a legal term denoting a certain specified number out of a larger number as entitled or bound to act for certain purposes. Thus, in statutes appointing commissioners or trustees of a public work it is usual to name a certain number of the whole body as sufficient to discharge the business when it may be inconvenient for all to attend. For the origin of the expression, see Justice of the Peace, Vol. VI. p. 378.

**Quotidian Fever.** See Ague.

**Quo Warranto**, the title of a writ by which a person or corporate body is summoned to show by what warrant a particular franchise or office is claimed. In the reigns of Charles II. and James II. the writ was used oppressively, for the purpose of depriving cities and boroughs of their liberties. At the present day an information in the nature of a quo warranto may be filed, with the leave of the court; disputed questions in regard to municipal offices, &c. are sometimes brought to trial in this way. The information is now regarded as a form of civil process.

**Qurán.** See Korán.
is the eighteenth letter in our alphabet. In ancient Egyptian there seems to have been no clear distinction between the sounds of r and t, both of which are liquid trills, the breath escaping over the vibrating edges of the tongue—in the one case over the tip, in the other over the sides (see L). Consequently the hieroglyphic picture of the "lionsse," from which our letter l is derived, was used almost interchangeably with the picture of the mouth (see Alphabetic), which became the source of the letter r. But the Semites, who obtained their alphabet from the Egyptians, made a clear distinction between the two sounds, and hence the two Egyptian symbols were specialised, the tailed hieratic form of the Egyptian picture of the mouth being exclusively adopted as the Semitic sign for r. It was called resh, "the head," because in the hieratic form, 9, it resembled the oval of the head supported on the neck. In the lapharyngeal writing of the Phoenicians the letter became angular instead of rounded, and the Semitic form, A, passed without alteration into the earliest Greek alphabet. When the direction of the Greek writing was reversed the form was somewhat rounded, giving for the sound of r the symbol P, which was called rhõ. The Semitic name resh or rhōs would become rhōs in Greek, but as in Greek an s normally disappears between two vowels, this would give rhōs, and finally rhō, owing to the coalescence of the vowels. In the primitive Greek alphabet, as in the Phoenician, the forms of the signs for b, d, and r differed little, and confusions arose. Hence the signs were differentiated in various ways. In the early Greek alphabet which found its way into Italy the tail of P was curved round, giving the form R with a lower loop, to denote b; while for d or t or the tail was shortened and finally disappeared, giving D. For r a short tail was added, giving the form R, which ultimately became K, while the form P was retained to represent r in the Eastern alphabet and in the Western to represent p. The tail of K began to make its appearance in the Greek alphabet before it was transmitted to Italy, but subsequently disappeared, other ways of avoiding the confusion between the forms having been invented. For the lapharyngeal and capital forms the old R has been retained, but in minuscule writing we use r and 2, the first of which is an uncial form derived from l; the second, called the r rotunda, coming from the old Roman cursive, in which the vertical stroke of R has nearly disappeared, being represented only by the small tag at the top of r.

The sound of r is a true consonant in the north of England, where it is exaggerated in the Northumberland burr. In Sanskrit it is vocalic; in the south of England it is often reduced to a semi-vowel or even to a vowel; while in the Midlands, in Scotland, and in France it preserves the proper sound of a trilled liquid which it had in Latin and Anglo-Saxon. After a guttural vowel it is hardly heard, farther being now almost indistinguishable from father. The Irish r is a survival of the old English sound, the pronunciation karum for 'harm,' arrum for 'arm,' and boren for 'born,' reproducing, it is believed, the medieval English sound, which is now less resonant than it formerly was. The sounds of r and l are often interchanged. In the Latin alphabet the Semitic symbol for r represents l, and the symbol for l represents r. The Japanese sign for r was obtained from a Chinese sign for l, and some Polynesian and South African peoples replace r by the easier sound of l, as is also done by English children, who, however, often prefer v, saying very for 'very.' The sound of r is usually the last which children learn to pronounce. In English l frequently replaces r and occasionally r replaces l, as in 'turban' from tolbent. Sometimes r disappears, as in 'speak' from E. O. spreyen, 'pin' from O.E. pream, 'paby' from O. Fr. para- lysie, and 'cockade' from O. Fr. cocart. It is intrusive in 'shill' from O. E. schill, in 'boarse' from O.E. hōs, in 'partridge' from Lat. perdix, in 'cartridge' from Fr. cartouche, in 'corporate' from Fr. corporal, and in 'culprit' from Lat. culpae. It is also intrusive in iron and bride-gressive. There is a modern tendency to insert a final r, as in 'tater' for 'potato,' and 'Victoriar' for 'Victoria.' In the words our, your, their, her, the r is a survival of an old genitive suffix. Sometimes r is transposed, as in 'horse' from horses. In Latin r supplants s between two vowels and sometimes at the end of words, as in 'arena' for asena, 'dari' for dasi, 'plurima' for plusima, 'honor' for homos, 'arbor' for arboes.

Raab (Hung. Győr), a town of Hungary, stands on an extensive plain at the confluence of the Raab and the Little Danube, a branch of the great river of that name, 67 miles WN. of Buda-Pest. It contains numerous religious edifices, among which is a beautiful cathedral. The manufactures are chiefly tobacco and cutlery. Pop. 22,951.

Raalte, a town in the Netherlands, in the province of Overijssel, 11 miles NNE. of Deventer. Pop. 5795.

Rasay, one of the Inner Hebrides, lies between the Isle of Skye and the mainland of Scotland, and belongs to Inverness-shire. It is 13 miles in length from north to south, 34 miles in greatest breadth, and 24 sq. m. in area. Pop. (1891) 647; (1891) 438. The western side of the island is bare and uninteresting. On the eastern and more sheltered side there is some striking scenery. Dun Caan (1456 feet) is the highest point, and Brochel Castle, on the east shore—now a mere ruin—the chief object of interest.

Rabanus Maurus (or more correctly Ira- bauus), a great Carolingian churchman and divine, was born of noble parents at Mainz about 776, and had his education at Fulda and at Tours under Alcuin, who summoned him Maurus after the favourite disciple of St. Benedict. He was next placed at the head of his school at Fulda, where he trained scholars like Walfrid Strabo and Otfrid of Weissenburg. In 822 he became abbot, but resigned in 842 to retire to the neighbouring cloister of Petersberg, whence in 847 he
was called to the archbishopric of Mainz. The chief event of his reign was his severity against the too logical monk Gottschalk for his views on predestination. He was a skilful writer, but showed erudition but little originality. They include Commentaries on the Old Testament, St Matthew, and St Paul's Epistles, homilies, doctrinal treatises, hymns, and a Latin-German glossary to the Bible (De Insitutione Clericorum et De Universo Libri xxii., sine Exynothiarum Opus, a kind of encyclopaedia of its time.

His Opera Omnia (so called) fall vols. civii.-cixii. of Migne's Patrologia Curaus Compleutis—a reprint of the Codex Maximus, 1673), to which are prefixed the Lives by his disciple Reudolphus and by Joannes Thirifium. See the studies by Spengler (1586), Kébler (1587) and Ritcher (1582).

Rabat, also called New Sallee, a seaport of Morocco, and one of the most picturesque towns of the empire, is situated on the south side of the Bu-Bagreb, at its entrance into the Atlantic. It stands on cliffs in the midst of gardens, and is overlooked by a large citadel. The most conspicuous object is, however, the tower of Ben-Hassan (180 feet high), rivaling the great towers of Seville (Giralda) and Morocco (Kutubiyah); near it is the residence of the Sultan, which it is intended to be made the largest in the world. Ruins still exist of the sultan's palace that was immortalized by the feats of Dick Whittington's cat. Carpets, shoes, and mats are made, and woollen dyed. But, owing to the sitting up of the mouth of the river, the commerce of Rabat has much declined. Formerly it was the centre of the European trade with Morocco; it still exports olive-oil, grain, hides, flax, wool, maize, and millet. There is a small import of cotton-stuffs, sugar, candles, and tea. 

Rabat, vol. Vi. 35, 1890. See English Illustrated Magazine (February 1890).

Rabbit (Heb. 'my master,' my teacher'), an honorary title of the Jewish Masters of the Law, which is first found applied after the time of Hrodol, subsequently to the disputes between the two schools of Shamaii (q.v.) and Hillel (q.v.). It was in common use in the time of Christ, who is addressed as much by his disciples and the common people. Other titles of the same kind are Rab (master'), Rabban ('our master'), and the Hellenistic Rabboni (my master'). The title Rabban was first given to the grandson of Hillel, Gamaliel (q.v.), as prince-president of the sanhedrim, and was only bestowed by seven other exalted chiefs of schools. At present nothing but the degree of Morenu ('our teacher'), bestowed upon a candidate who proves his erudition in the written and oral law and all its bearings before a college of rabbis, is wanted to render him eligible for the post of a rabbi, which, however, carries no authority whatsoever with it, save on a very few points. It is a mere ignorant error to hold that the rabbi of our day is a kind of 'priest' in the sense of the Old Testament. He is simply the teacher of the young, delivers sermons, assists at marriages and divorces, and the like, and has to decide on some ritual questions. Up to the times of the removal of Jewish disabilities in Europe (see Jews, Vol. Vi. p. 328) he had on some occasions also to give judgment in civil matters. For the later Jewish, or so-called Rabbinic, literature, see Taen. 351 et seq. for Rabbinical Jews and Rabbanites, see the same article, p. 330.

Rabbit (Lepus eucrius), a well-known rodent in the same genus as the hare, from which it differs in some external features and yet more in its habits. The rabbit is smaller than the hare, with shorter head, ears, and legs; the ears are shorter than the head, and have no black patch at their apex, or at most a very small one; the hind-legs are not so much longer than the fore-legs as they are in the hare. They are entirely covered with a very fine grey. Moreover, the rabbit brings forth blind and naked young, which it nurses in the safe retreats afforded by the burrows. These burrows are often of great length, have a crooked course, and generally several openings. Rabbits live socially, and prefer for their warrens places where the soil is loose and dry, and where 'furse or other brashwood affords additional shelter. They feed on grass, herbs, and tender bark. Their reproduction is very prolific, for breeding may occur four to eight times during the year, the period of gestation lasts only thirteen days. The young are born without eyes, nose, and ears, and sexual maturity is reached in about six months. A tame rabbit has been known to bear fifty-eight young in a year, and Pentann calculated that from one mother no less than 1,274,840 descendants might result by the end of four years, assuming that all the members of successive generations survived and reproduced. The young are born—naked, blind, and helpless—within the burrow in a special brood-chamber or nest lined by some of the mother's fur. The mother-rabbit takes much care of her young, nor is the male lacking in affection, though not so great; it destroys the brood. For periods at least rabbits are monogamous, and the males exhibit much affection for their mates and hatred of rivals. The normal length of life seems to be about seven or eight years. The gregarious life of a rabbit Warren needs no description, and may be noted that adjacent burrows sometimes intersect. The senses of rabbits are acute, but their intelligence is not highly developed. They are most active in the gloming and darkness. Their chief enemies are birds of prey such as hawks and owls, and carnivores such as fox and weasel. By stamping with the hind-legs the older rabbits give signals when danger threatens. It is said that the whiteness of the exposed under sides of the tails is of advantage in indicating the direction of movements, but one would think that it must be also disadvantageous in making the rabbit's running more apparent.

Tame rabbits are varieties of the wild form, modified by the artificial selection usually associated with domestication. Among the more important breeds are the 'silver rabbits' with buff-gray silvery fur, the 'Hussars,' the 'Angora rabbits' with short ears and very long silken fur. Albinas with white hair and red eyes are common. The domestic varieties, especially the last, are much less hardy than those which run wild. Some remarkable modifications have occurred among rabbits in which cross-breeding has been prevented by insolation. Thus there are local varieties in the Falkland Islands and in Jamaica. Most remarkable are the dwarf-rabbits of Porto Santo, one of the Madeiras, which are said to be the descendants of a single little rabbit there in the beginning of the last century. These are so much modified that they do not breed with other rabbits. Hybrids between hare and rabbit are not uncommon in France. In regard to the keeping of tame rabbits, it may be noticed that they eat almost any kind of vegetable food, with the exception of cabbage, white roots, celery-tops, carrot-tops, and other produce of the garden, not suitable for human use, are readily consumed by them, as well as chickweed, sow-thistle, dandelion, and many other weeds. When their rabbit enclosure contains a plot of grass and clover it affords them all they require of their food. Great care is requisite to keep their boxes dry, neglect of which, and a too exclusive feeding with green and succulent food, cause
RABBIT

RABBIT-skins have a regular commercial value in consequence of the hair being well adapted for felting purposes; its chief use is in making the bodies of coats and the tails of their felts. It has been a large market in the United States for the imitation furs prepared from rabbit-skins, to which country British manufacturers have largely exported. Tasmania exports about 30,000 rabbit-skins per month to England. See FELT, FUR, HATS.

Rabelais, François. According to those who wrote while his tomb was still standing with his name and age upon it, who had access to the church register of Meudon, and who visited the place of his birth while his memory yet lingered, in order to collect every fact that could be found concerning him, this great humorist was born in the year 1483. His father, proprietor of a vineyard called La Devinière, was an apothecary in the town of Chinon, where his house, which afterwards became a cadet, is still shown. François was the youngest of five sons. Of his elder brothers nothing whatever is known. Bishop Huet, annotator of Rabelais, found an old woman of the name in a village near Chinon, and gathered a local tradition that the last male representative of the family, and apostrophised by their father at the age of 12, was from 1483 to 1533, a disciple of the Franciscan order. At the age of nine the boy was sent to the convent of Soûlié, near his father's estate. 'There are some mothers,' he wrote years afterwards, 'who cannot bear to keep their children about the house more than nine, or, still oftener, seven years, in order to keep them from growing wild.' By that time they had passed over the web and entered into the thicket of their native province. At Scoury, the boy was placed in the hands of a laic brother, to whom he was submitted. Nothing is known about the nature of his scholarship while at La Baunette. We may, however, very well understand, from the continued protection which Jean de Bellay (afterwards Cardinal) extended to him, that as a young man he had shown promise and proved his abilities. At the close of his course._

RABELAIS 541

RABELAIS (1889), the believed there were nine diseases, it is believed they were, until comparatively recent times, confined to the Mediterranean region. It is certain that in Spain, and still more in the Baltic Isles, they did tremendous havoc in the 1st century B.C.; still it seems that bones of rabbits have been found in Quaternary deposits north of the Alps. Rabbits spread very rapidly. In some parts of Scotland they were hardly known in the 18th century, though elsewhere they abounded. Their introduction into Ireland is also recent. They are not able to stand great cold, and are therefore absent from Scandinavia and North Russia. The most signal instance of their rapid distribution is to be found in their present abundance in the United States, and New Zealand, and of the latter of which countries seven rabbits were first turned out near Invercargill, apparently about 1800. As to Australia, the agent-general for New South Wales writes (1891) that this department is unable to state the exact date when rabbits were introduced into the colony, but it is certain that they existed about forty years ago. And according to the Victorian Year Book for 1887–88, tame rabbits were kept in Victoria during the early years of the colony (towards the middle of the 19th century); but rabbits, the pest-tumour of the old world, was brought out on an extensive scale by the emigré proprietor in the western district. They bred rapidly, and for several years there was a demand for couples for breeding purposes in most districts, nobody guessing what a plague they were to become. In both Australia and New Zealand there have been attempts to exterminate them, but the predominance of males might result in unnatural conditions fatal to continued existence. Most practicable at present is the use of wire netting. Thus, if the poles where the rabbits drink are surrounded with netting, thousands die of thirst in a short time. In New South Wales alone the outfall from rabbit destruction in 1883, was over 21,000,000; as many as 27,000,000 have been killed in one year, and their skins paid for. California and Idaho have also suffered severely from the rabbit pest.

Besides eating up crops and pasture, rabbits often do great harm by burrowing among trees, and multiplying to an extent which seriously affects the prosperity of farmers and reapers of stock. The climate and soil are suitable and their natural enemies are few. Many endeavours have been made to exterminate them, but without success. Trapping, poisoning and hunting down by hounds and a temporary reduction of numbers. Pasture proposed to infect them with fowl-cholera, and to some extent this has been tried. It has been lately suggested that only the females should be killed, so that the predominance of males might result in unnatural conditions fatal to continued existence. Most practicable at present is the use of wire netting. Thus, if the poles where the rabbits drink are surrounded with netting, thousands die of thirst in a short time. In New South Wales alone the outfall from rabbit destruction in 1883, was over 21,000,000; as many as 27,000,000 have been killed in one year, and their skins paid for. California and Idaho have also suffered severely from the rabbit pest.

On the other hand, the white flesh of rabbits forms excellent food, the skin and the fur are much used, and, as Gilbert White noticed, rabbits by their nibbling make 'incomparably the finest turf.' The preserving of rabbits in the lap in some places an important industry. Rabbits are not technically game (see GAME-LAWS). The old English name for the rabbit is comy, but the scony of Scripture belongs to the genus Hyrax, anatomically a very different animal.' See HARE, RODENTS.
teries were at that or at any period willing to sacrifice a larger part of a life of servitude and hard labour for one at all. Interest was required for the admission of a boy; in some houses he must be of good birth, in others he must have shown abilities beyond the common. Rabelais, in fact, had no choice at all.

We must derive him at the beginning of his studies. On the contrary, he had access to a large and well-furnished library, whether outside the house or in it is not known, and he read all the books that he could get; acquiring Greek, Hebrew, and Arabic; studying all the Latin authors within his reach. French of the 13th and 14th centuries, books of medicine, astronomy, botany, mathematics—everything in the omnivorous fashion of his time, when every scholar with a good memory wished to become a Doctor Universalis. He had companions in his ardour for learning, especially one of his brother-monks, the Ven. and Archimandrite of the Cistercians, far less severe than those of the Cistercians, permitted the monks to go outside the house, and in the little town of Fontenay Rabelais found a friend, André Tirasqueau, Lieutenant-General of the bullvick, lawyer, scholar, and writer. Also his early and life-long friend, Geoffroy d'Estissac, Bishop of Mauléon, lived chiefly in his chateau of Ermenonv, close to Fontenay.

Many silly stories have been attributed to Rabelais in these years. They all tend to show him in the light of a monkey, mischievous and impudent. We may dismiss them as the fables of Cæsarius; however, that we are to regard him—now a priest—as a person grave and serious, charged with the sense of his sacred responsibilities and his vows: to be a priest in the 16th century is not quite the same thing as to be a clergyman in the 19th. Rabelais was at all times a misanthropic man, more given to laughter than to tears, and if he did not play silly tricks upon the brethren he certainly laughed at them. We find him corresponding with the great Budé, as one scholar with another. He is on terms of intimacy with Tiraquen and his brethren learned the law. He is on terms of friendship with Bishop D'Estissac. Evidently a monk of repute and distinction, he is far above the heads of his nameless and obscure brethren of the monastery. Then we hear of trouble and persecution. The Franciscan jealousy of the old learning has been transformed into jealousy of the new learning. The brothers take their books away from Rabelais and Amy—perhaps lay the pair by the heels in the convent prison.

When they were released a limiting of the convent fell upon these two scholars. What to do? They took a walk of ailes—Virgil—and chanced upon the following line:

_Hae! fuges crudelis terrae, fuges lutas avaram!

What could this mean but a direct injunction to escape? They obeyed the oracle and fled—they ran away. Rabelais, returning to the world, was past forty years of age. He seems to have sought the protection of his friend Bishop d'Estissac, by whom he was received. Through him, or perhaps through the kind offices of Cardinal Du Bellay, he obtained the pope's permission to pass from the protection of the monastery without incurring the penalties of the Inquisition. He then hastened in no hurry to enter another cloister. He remained at Liçugé with the bishop for six years. It is said that during this period he took a small country living, but this is doubtful. Most likely he passed the whole time in study. Perhaps he paid visits to Paris and Bourges. He made the acquaintance of Marot, whose copy of a poem written for his benefit had now ceased to be encyclopaedic: its special aims may be inferred from the fact that on the 17th day of September 1530 he entered the university of Montpellier as a student. That he was already a man, as an artist and a scholar, is proved by the fact that two months afterwards he was admitted to the undergraduate course of three years, was admitted to the Bachelor's degree, and allowed to lecture on Hippocrates and Galen. He dissected publicly before the students, and left the university in the year 1532, returning in 1537 to take the Doctor's degree.

In 1532 Rabelais went to Lyons to get his first book, _Hippocratis et Galeni libri aliquot_, published. He remained there as physician to the hospital. At this time Lyons was as great an intellectual centre as Edinburgh about the beginning of the 19th century. Here the great printer Gryphe had his workshop, and issued no fewer than three hundred books, including the Latin Bible of 1550, remarkable for its correctness and for the beauty of its type, and the commentaries of the French philosophers, the book of Galen, consisting of 1800 columns each, and only eight errata for the whole work. Round this printer was gathered a company of scholars and poets called the Société Angélique, a company of broad thought and advanced opinions. As regards religious opinions, it must be remembered that to the five years of that period the Christian religion meant little more than the Roman ritual and the Roman discipline. They had no idea of Christianity apart from the superstitions they derided. It is not fair to call them atheists: they had adopted the vague but hopelessly romanticizing creed that they would not, being scholars, wholly die: they would, after desiring to be allowed still to watch the advance of learning. Men, for example, who were physicists, like Rabelais, would worship the Creator of the vast and wonderful cosmos. Dolet represents the scholars of Lyons, Desperiers the poets, Rabelais the men of science. All three despised and hated the Church of Rome. Two of them felt the heavy hand of the church in life, the third after death. Dolet was strangled and burned at the stake; Desperiers, starving and despairing, fell upon his sword; Rabelais, dying peacefully, has been assailed ever since as a ballet and a reveiler in foulness and filth.

It was at Lyons that Rabelais began the famous book, or series of books, by which he will for ever be remembered. In the year 1532 he brought out _The Great and Inestimable Chronicles of the Great and Enormous Giant Gargantua_. Every Tournagen knew this good giant. Rabelais had heard about him while a child. It was he who set up the dolmen at Poitiers and the pierre converte of Samour. When he scraped the mud from his shoes he made hills, which he then filled and swallowed six bullocks, a burdened cart, and the driver. Once he swallowed a ship laden with gunpowder. In fact, Rabelais, who never invented anything, but embellished and adorned everything, did not invent Gargantua. In the sequel or second book, _Pantagruel_, the author departed from his first plan: he no longer wrote pure burlesque: serious ideas are set forth side by side with overwhelming nonsense, and the reader steps from unbridled fancy into regions of sense and wisdom. In order to make the first book correspond with the second, Rabelais wrote it in three weeks. But he never changed his style, he was fuller of sense and wisdom than the second. Both books had a prodigious success. They were published under the anagram of Alcôfridas Naisier. At the same time he began his almanac, which
he continued for eighteen years. These are all lost except a few fragments.

In 1534 he accompanied his old friend and patron, Cardinal Du Bellay, to Rome. He promised himself great things on this expedition. He would visit the Italian scholars; he would find new plants; he would dig and discover great things; he would study the frescoes of Raphael; and he returned with Mariani's book on Rome, which he translated and published with notes of his own.

In 1535 new editions appeared of the Gargantua and Pantagruel. In 1536 Rabelais again went to Rome. Some of his letters from Italy to his friend Bishop Fleury have been published, and contain an abjuration from the pope for having forgotten to go into a Benedictine house, for neglecting his Hours, and for practising medicine. He also received permission to go into any Benedictine house which would receive him—time being of course taken to find one. He was enabled to hold ecclesiastical offices, to practise medicine without fees, without the knife, and without fire. He now had nothing to fear from his old enemies of Fontenay le Comte. He amused himself in Italy with collecting curiosities planted by Rabelais France first, and England next, over the melon, artichoke, and turnip-seeds to the bishop and bought curiosities for him. In 1537 he is found in Paris at the great literary banquet held in honour of Dolet's escape from a charge of murder rising out of accidental homicide. From England, where he was with his old friend, he taught at Montpellier. In the latter year he went to Lyons, where he stayed a short time only, removing to Paris in 1540. Once more he made things right with the church, obtaining absolution for not having found a Benedictine house, and permission to enter the Collegiate Chapter of St. Maur des Posses instead of a convent, and to hold any benefits which might be conferred upon him. In 1543 he was at Symphorien near Lyons—where he witnessed the death of Guillaume du Bellay—at Chillon, Ligugé, and Angers.

During this time he was writing his third book. It was a dangerous time for heretics. A whisper of heresy at the outset might not only ruin the book, but also bring the author to the stake. He caused the first two books to be read to the king, who, however, put it upon record that he had not been present with them. He was granted permission for a new edition, and granted a license for the publication of the third. Rabelais did not avail himself of the permission for a new edition. Already many impieties had been pointed out which he declared were due to the printers, interpolated and so forth. Best not to bring out a new edition. But he printed his third book. This was in 1546.

In 1547 the old king died, and a reaction against liberty of thought immediately began. They attacked Rabelais. Not content with finding impieties in the first three books, they printed a thing which they called his fourth book. Rabelais fled: he went to Metz, where he practised medicine. Cardinal Du Bellay, himself suspected of liberal tendencies, withdrew to Rome, whither he called Rabelais. On the birth of King Henry's eldest son great rejoicings were held in Rome. Rabelais wrote an account of these, and sent the little book to the Cardinal De Lorraine, a stroke of policy which enabled him to return, and gave him the living of Membon.

From both sides, Catholic and Protestant, cries came that his book should be suppressed and the author burned. Nothing, however, was done. But Rabelais did not dare to proceed further with the fourth book than the eleventh chapter. There it broke short off. This was in 1549. The author, now growing old, lived quietly at his living, preached, catechised the children, and led an exemplary life.

Early in 1558, a fortnight before the parliament allowed the sale of the book, he resigned his living, and went to Paris. Here, two months afterwards, he died. It was in the Rue des Jardins, parish of St Paul. They buried him at the foot of a tree, on which his name was carved. The tree was cut down a hundred years afterwards. Ten years after his death appeared the fifth and last book, which had been left in MS., unfinished and without the author's corrections.

These are the facts which have been gleaned concerning the life of this great humorist. The riotous license of his mirth, which is restrained neither by decency nor by reverence, has made him as many enemies as his wisdom has made him friends. This fault, which Rabelais shares with many writers of his age—our own dramatists were quite as bad—has been made the most of by the former, his enemies. We may grant the blot; yet it is not inherent in the book; it is not woven in the web: and when it is removed there remains the most astonishing treasury of wit, wisdom, common-sense, and satire that the world has ever seen. All, however, assumes the form of allegory: those who have no taste for allegory cannot appreciate Rabelais.

Among the many modern editions of Rabelais may be named those of Lacroix and A. De Montaiguon (3 vols. 1888-73), that in the 'Collection Jannet' (7 vols. 1867-74), the Jouest edition (4 vols. 1885), and especially that in the 'Collection Lemercier,' by Ch. Van Hout, Laveaux (in 6 vols., i. to iv. 1886-81). See Daedalus, Rabelais (Paris, 1881); Lacroix, Rabelais, son Vie et ses Oeuvres (Paris, 1886); Flouery, Rabelais (2 vols. Paris, 1874); Urenhart and Metteau's English translation (1893-94, suppressed, but often reprinted); the present writer's Rabelais (1879), and his Routings in Rabelais (1881); Stapfer, Rabelais (1880); Heuillard, Rabelais: ses Voyages et Bastlie, son Ezai a Metz (1881); René Millet, Rabelais ('Grands Ecritains,' 1893).

Rables. See Hydrophobia.
Rabshakeh, an officer of the king of Assyria, the name of a person; but apparently an official title, presumably that of the chief cup-bearer.
Rabutin, or Bussy-Rabutin. See Sévigné (Madame de la Sablière).
Rahouant, a farinaceous food prepared from certain acorns. See Oak, Vol. VII. p. 561.
Racalulto, a town of south Sicily, 13 miles by rail NE. of Girgenti. Pop. 13,133.
Racconigi, a town of North Italy, 23 miles by rail S. of Turin, with a royal palace. Pop. 7,875.
Raccoon, or Raccoon (Procyon), a genus of quadrupeds of the Bear family (Arctoida), with six molar teeth on each jaw; like other Arctoids, it is plantigrade, and has no retractile claws. There
are certainly two, possibly three, but not more than four species of racoon, which are restricted to the United States, and to the north of America we meet with the 'coon' ('Procyon lotor'), so called from the habit of soaking its food in water. This animal prefers open woods, and is a good climber, making its home in trees. The raccoons, however, descend to the ground to search for their food, which consists chiefly of nuts, fruits, crayfish, and various shellfish; they will also feed upon corn. These animals are among the most strictly nocturnal of mammals; they hibernate during the winter. In South America occurs P. cencerurus, and a well-marked variety which may be called P. canescens, and named P. nigripes on account of its dark-coloured feet. For the Raccoon Dog, see Dog.

Rachel, Elisabeth (properly Eliza Rachael Félix), a great tragic dramatist, was born in London, the daughter of Irish Jewish parents at Muni, in the Swiss canton of Argang, 24th March 1821. At last the family settled at Lyons, and here Rachel and her sister Sarah used to sing for chance gratuities at the streets and cafes. About 1830 the household was transferred to Paris, and here Etienne Choron gave her her first lessons in singing, Saint Aubaine in declamation; but later it was Sançon from whom she learned most. Mademoiselle Mars divined her genius, but it was not till Véron and Jules Janin had written glowing criticisms that she took the playing world of Paris by storm. She made her first appearance at the Gymnase in the Vendémiaire in 1837 with moderate success, but on 12th June 1833 she appeared as Camille in Les Horaces at the Théâtre Français. From this time forward, in the great parts supplied by the classic masterpieces of Corneille, Racine, and Voltaire, she shone without a rival; her fame may be said to have culminated in her appearance as Phèdre in Racine's tragedy in 1843. In Adrienne Lecourte, a piece expressly written for her by MM. Legouvé and Scribe, she had also immense success, though in other modern parts her popularity was somewhat less. The furore excited in Paris in 1848 by her public recitation of the Marseillaise will continue to connect her name with the history of the Revolution. In 1849 she made the tour of the French provinces; before or afterwards she also visited London, Belgium—where Charlotte Brontë saw her—Berlin, and St. Petersburg, everywhere meeting with enthusiastic applause. Her health now began to fail; in 1853, in the course of a professional visit to America, it altogether gave way, and she returned utterly prostrated. A residence at Cairo, Egypt, where her father, a Judge, had previously been appointed to a professorship, was recommended; and on the 3d January 1858 she died at Cannaq, near Toulon. As an artist, within the limits prescribed by her genius, Rachel has probably never been quite equalled. Of the burning intensity which characterized the rendering of passion in her fiercest concentrations no words can give an adequate image. She does not act—she suffers, one observer well said of her. Her Phèdre—by common consent her masterpiece—was an apostasy of human agony, not to be forgotten by any one who ever witnessed it. In character Rachel was neither exemplary nor altogether amiable. She gave her first love to a Jew, who used her shamefully, publishing her letters after the rupture; in 1844 she bore a son to Count Walewski, himself a son of Napoleon by a Polish mother. In her professional relations she was notoriously grasping and avaricious, although she could be royal in her affections. Her family, and heaped them with the wealth that she had gained. Her immense popularity enabled her to dictate her own terms to managers, and of this power she is said to have availed herself without scruple or generosity. She made over four millions and left one and a half million of francs. Her elder sister Sarah (died 1877) failed as an actress, but lived to make a fortune by the sale of the cosmetic 'eau des fées.'

See J. Janin, Rachel et la Tragédie (1858); D'Heyri, Rachel auprès de sa Correspondance (1882); and the Life by Mrs. Algernon Ainslie (1895).

Racine (Gr., 'backbone'), in Botany, the primary floral axis, an elongation of the stem or of a branch, from which arise the flower-stalks (peduncles), or to which the flowers are immediately affixed.

Racine, capital of Racine county, Wisconsin, is situated on Lake Michigan, and on both sides of Root River, which is crossed by five swing bridges, and where the town has its name from its situation at the mouth of the river. By rail the city is 62 miles N. of Chicago and 23 S. of Milwaukee; and in summer there are daily steamers to Chicago and the north. Racine contains a lansdowne post-office and city hall, a hospital, the Toynbee Asylum and the University of the North-west (Episcopal) founded in 1852, and formerly called Racine College. A large trade is carried on in lumber, and, besides flax, flour, and woolen mills, boiler-works, and lined-oil-works, there are manufactories of ploughs, pumps, wagons, Iimming-mills, iron-works, work, cartage, furniture, refrigerators, boots and shoes, rubber clothing, &c. Top. (1850) 16,031; (1900) 29,102.

Racine, Jean, the greatest tragic dramatist of France, was born at La Ferté-Milon, in the modern department of Aisne, in December 1639, and was baptised on the 22d of that month. His father was a procureur or solicitor by profession, and held, like his father before him, the office of comptroller of salt at La Ferté. His mother died while he was still a child, whereupon his father married again, but soon after died also. The boy was taken care of by his maternal grandfather, and was sent for his education to the college of Beauvais, whence he passed to Paris. In October 1653, being indeed, closely connected, both on the father's and mother's side of the family, with the famous abbey. Here he studied hard under the especial care of Claude Lancelot, Nicole, and Le Maître, and at an early age discovered a faculty for verse-making and, still worse, a liking for romance that caused his good teachers no small uneasiness. He was almost nineteen when he left Port Royal to pursue the course of philosophy at the Collège d'Harcourt, and here he appears to some extent to have exchanged the severity of his Jansenist upbringing for the lenity of the moral life, and as to have first felt the attraction of the life of letters. Naturally he became estranged from his Port Royal friends, who saw spiritual ruin in his worldliness and his intimacy with the abbored actors and actresses. Meantime he had written an ode, La Nymphé de l'Amour, on the marriage of Louis XIV., finished one piece and began another for the theatre, and made the acquaintance of La Fontaine, Chapelain, and other men of letters. About this time he lived a while under the care of his cousin, N. Vitart, fifteen years his senior, and gave him some kind of assistance in his work as financial secretary to the Due de Luynes. Many letters of this period to Vitart, the Abbé Lo Vasseur, and La Fontaine are extant, and show how the lessons of Port Royal were falling into
forgetfulness, as his true vocation opened itself up before his eyes. The great dispersion of the solitaires of Port Royal took place in 1661, and, from Racine’s contemporary letters to the Abbé Le Vaillant, clearly before 1668. In February of 1668 he went to Uzès in Languedoc, hoping, but in vain, to get a benefice from his maternal uncle, the vicar-general of the diocese, and here he divided his time between St Thomas, Virgil, and Ariosto. Again in Paris before the beginning of 1664, he obtained a copy of Molière’s Henri le Grand. His wished to be the king of six hundred frames for a congratulatory ode. But indeed he received almost to the end of his life handsome rewards in money—‘gratifications’—from the court. An ode of gratitude to the king for one of these, La Renommée aux Muses, gained him the life-long friendship of Boileau, and from about this time began the famous but much over-estimated friendship of ‘the four’—Boileau, La Fontaine, Molière, and Racine. Unfortunately from about this point there is a break in his correspondence, so that we lack satisfactory evidence about his most doubtful and, at the same time, interesting points in his career—his singular struggle against Molière, his bitter attack upon Port Royal, and his final conversion and retirement from dramatic work. His earliest play, La Thébaïde ou Les Hémonides, was produced at the Royal Academy of Letters, and he was sent from the Hôtel de Bourgogne—a fact which of course involved a complete break of friendship between Molière and himself. This famous quarrel is difficult beyond most to clear up, but there is at least light enough to see that the wrong did not rest with Molière. Racine showed himself as hostile to Corneille, most probably only because the other had the advantage of a more active and less central a rôle. But he soon plunged into a yet more discernible quarrel. Stung by one of Nicole’s Lettres Visionnaires (January 1666) condemning the romancer or the dramatic poet as an ‘enpoisonneurs public’ in accordance with the ethos of his own art, Racine published a savage and stinging letter to the author, in which he heaped disgrace on his own head by indecent personalities upon Nicole and even his dead teacher Le Maître. Boileau’s advice alone saved him from further staining his own reputation. ‘This letter,’ said Boileau, ‘may do credit to your intellect, but certainly none at all to your heart.’ Later in life Racine himself said he would give his heart’s blood to wipe out the most disgraceful blot on his life. His repentance made noble atonement for the wrong—as for the literary quality of the letters, for brilliant wit and delicate irony they were not unworthy of the hand of Pascal.

During the next thirteen years Racine produced his greatest work, seeking relaxation from labour in at least one liaison with an actress. His plays followed one another in a stream of glowing character Hermione; Les Plaideurs (1668), a delightful little comedy of satire against lawyers, which Molière was the first to appreciate; Britannicus (1669), which Voltaire styled ‘la pièce des connaissances’; Bérénice (1670), an unconvincing and uncostumed contrast with Corneille, the story of which had been given to both poets by Henrietta of Orleans; Boisjuzet (1672), admirable, but anything rather than oriental; Michielide (1673), produced almost at the moment of his admission to the French Academy; Lapétraie (1675), a master-piece of pathos; and Phèdre (1677), a marvellous representation of human agony, which afforded a subject adequate even to the powers of Rachel. With the last ended abruptly his thirteen years of unbroken playwriting. A few days after its production the Troupe du Roi introduced an opposition Théâtre, by Plauche, which, though worthless by comparison, was eagerly supported by a powerful party, partly political. The next November 1668 he was made a member of the Académie Frangaise. Whether from disgust and mortification, or from the conversion attributed to him just at this period, Racine turned at once from dramatic work, made his peace with Port Royal, married on June 1, 1677, and settled down to twenty years of domestic life. His wife, the most beautiful woman in the court, bore five children—three daughters and two sons—and he himself had found ample profit in the drama, besides enjoying an annual gratification that grew gradually from 800 to 2000 livres, not to speak of the office of treasurer of France at Moulins, at least one benefice, and one from 1677, jointly with Boileau, the office of historiographer-royal of France, with a salary of 4000 livres a year. The last involved the duty of accompanying the king on several of his expeditions, but in the case of both poets broke little historic fruit beyond a crop of good interpreters and a few sagas. In January 1685 Racine emerged from his retirement to pronounce the discourse at the reception to the Academy of Thomas Corneille, and at last did himself honour by his admirable enlouage upon his greater. In 1689 he wrote Esther, in answer to a request from Madame de Maintenon for a play suitable for her girls at Saint-Cyr. She had tried Andromaque, but found that the girls acted it ‘a great deal too well.’ Its success was great, but entirely warranted by the year’s most solid and technical work. Atlantide followed in 1691 with much less success, though it perhaps deserved even a greater. Four cantiques spirituelles, and an admirably written Histoire abrégée de Port Royal, make up the whole remainder of Racine’s literary work. In his later years he lost the favour of the king—how long by any means clearly understood. He is said to have prepared a memoir on the miseries of the people, and the king, finding Madame de Maintenon reading this, expressed his displeasure in some harsh words that were not published. On 4th March 1698 he wrote a long letter to Madame de Maintenon, to clear himself from the crime of Jansenism, but he never recovered the king’s favour, and his entire mortification appears to have hastened his death. He said to Boileau, who was old enough to be his father, ‘You may be right, boileau, ‘may do credit to your intellect, but certainly none at all to your heart.’ Later in life Racine himself said he would give his heart’s blood to wipe out the most disgraceful blot on his life. His repentance made noble atonement for the wrong—as for the literary quality of the letters, for brilliant wit and delicate irony they were not unworthy of the hand of Pascal.

In France it remains an article of patriotism to claim Racine as the greatest of all masters of tragic pathos, yet this estimate does not very greatly exceed the truth. He took the conventional French tragedy from the stronger hands of Corneille, and added to it all the grace of which it was capable, perfecting exquisitely its versification and rhetorical style in conformity with all the whole action to the central idea of the one dominant passion. But he was a far greater poet even than a dramatist, and the tender sweetness and beauty of his rhythm, the finished perfection and flexibility of his verse, with their old-world while yet ever present stamp of distinction that informs his style, combine to add a charm of its kind beyond anything else in the whole poetry of France. It may be that the highest poetry of all is beyond his reach, and that his verses are not for a sensitive ear, but such they haunt with a peculiar charm beyond the art of a Lamartine or a Hugo. Within its limits his poetry attains the perfection of the classic in the highest as well as severest sense of the term; it sums up in its
content all that was noble in the royalism of the 18th century, and in the spiritual aspirations out of which grew a Mère Angélique and a Pascal; and it attains the Olympian height of distinct originality as well in the balanced proportion and harmony of all its elements, the grandeur and sublimity of which it is capable of rising in a Pâraide, an Esthér, and an Athalie. These high creations transcend and crown with the glory of completion his habitual tenderness and beauty, but into this empyrean also the poet soars no less naturally on the same wing of ease and steadiness. Voltaire, once asked to write a commentary on Racine, answered, and with truth: "Il n'y a qu'à mettre au bas de toutes les pages—beau, pathétique, harmonieux, admirable, sublime."

The first collected edition appeared 1675-76; the last within his life-time in 1697. Of more important editions may be named the splendid folio of 1850, those of La Harpe (with commentary, 1807), Geoffroy (1808), Aimé Martin (1829), A. France (5 vols. 1874), and especially the splendid edition by Paul Monard in "Les Grands Écrivains de la France" (8 vols. 1865-73). The first volume of the last contains a Life; the eighth, a Lexique by Marty-Levaux. Of English translations are the Distinct Life of the Author, by Richard Pococke (1750); the Principal and Historical Events of the Inquisition by Edmund Smith, brought out at the Haymarket in 1707; and a complete motteau version by R. B. Bowell (vol. i. 1899; vol. ii. 1891). See vol. vi. of Sainte-Beuve's Port Royal, and vol. i. of Portraits Littéraires also Henry M. Trollope's Corneille and Racine, in the series of Foreign Classics.

**Racing.** See Athletics, Horse-racing, Rowing, Yachting.

**Racket,** an instrument of Torture (q.v.) used for extracting confessions from actual or suspected criminals, consisted of an oblong frame of wood, with a windlass arrangement at each end, to which the sufferer was bound by cords attached to his arms and legs. The unfortunate being was then stretched or pulled till he made confession, or till his limbs were dislocated. The rack was known to the Romans in Cicero's time, and in the 1st and 2d centuries A.D. was applied to the early Christians. According to Coke, it was introduced into England by the Duke of Exeter, Constable of the Tower in 1447, whence it came to be called the "Duke of Exeter's daughter." Its use first became general about 1419, for, in 1421, the Act of the 11th of Henry VI. I., to which it could only take place by warrant of council, or under the sign-manual. Under Elizabeth it was in almost constant use. In 1628, on the murder by Felton of the Duke of Buckingham, it being proposed by Charles I. to put the assassin to the rack, in order that he might discover his accomplices, the judges resisted the proceeding as contrary to the law of England. In various countries of Europe the rack has been much used both by the civil authorities in cases of traitors and conspirators, and by the Inquisition to extort a recantation of heresy, which is no longer in use in any part of the civilised world.

**Rack-a-rock.** See Billiards.

**Rackets** (or **Racquets**; M.E. racket; Span. raqueta, "racket," "battle-lore;" Arab. rakbat, "palm of the hand"). No reference is made to the game of rackets before the early part of the 19th century, and the game as then played differed materially from that of the present day. From 1821-22, however, in the porch of the Parish Church of Rackett, in Wiltshire, we find the word "rack" and the sport of "racketing" used to describe a game resembling the modern tennis. As late as 1825, the Rules of the Game of Racket published by Hope give the following: "The number of players shall not exceed two, and the ball shall be played against a single wall, the players having to come into a court marked out with paint. The score is decided by a simple majority; and if the ball strikes the wall, the players have to return it by a stroke without leaving the court, and the game is at the discretion of the player who last struck the ball in the play." The game was soon dropped, as it was considered a novelty, and the old game of court and ball came into favour, and since covered courts have been adopted by the universities and public schools the old game has become practically obsolete. When the site of Prince's Club was invaded by the builder in 1886 the headquarters of rackets were transferred to the Queen's Club, Kensington, where championship matches have been instituted, and where the university and public school contests now take place.

The modern court is about 60 feet long by 30 feet broad and 40 feet high. It is enclosed by four walls, and covered by a roof with a double row of skylights. The walls and floor are coated with cement, usually coloured black, and marked out by white lines as shown in the plan. A line 8 feet from the ground painted across the front wall is called the 'service line.' Below this at 2 feet is the 'play line,' which is made of wood, so as to enable the players to judge by the sound whether a ball jup or not. The racket has a small head with tightly strung gut and a long handle. The average weight is 9 oz. The ball is very hard, and about 1 1/2 inch in diameter. The server strikes the ball alternately from the two serving boxes a and b in such a manner that it flies direct from his racket to some part of the front wall above the service line, and rebounds into that quarter of the court opposite to him—viz. from a into A, from b into B. If the ball hits the wall below the play line, or goes out of court, the server's "hand is out," and his opponent has the privilege of serving. If it strikes the wall between the play line and the service line, or falls on some part of the floor other than that indicated, it is a 'fault,' and the server may refuse to take it. Two faults put the hand out. The server must return the service above the play line. The game consists of fifteen aces, and the server scores an ace when the striker out fails to return his service or any ball in the subsequent 'bally.' See Tennis, Lawn Tennis, Rackets, and Fives, in the 'Badminton' series, by J. M. Heathcote and others (1899).

**Racocy.** See Racocky.

**Racoon.** See Raccoon.

**Racocka,** the fur of the Coypu (q.v.).

**Racock,** a village in the south of the Polish government of Radom, in the 18th century a centre of Polish sympathisers, who printed here their Catechism (q.v.). Pop. 2109.

**Radcliffe,** a town of south-east Lancashire, on the Irwell, 2 miles SSW. of Bury and 7 NW. of Manchester. It has an ancient parish church (restored 1873), a ruined tower, a market-hall (1852), a co-operative hall (1878), cotton and cotton works, bleachfields, and coal-mining in the neighbourhood. Pop. (1851) 5002; (1881) 10,207; (1891) 29,020.

**Radcliffe, Ann,** novelist, was born in London, 9th July 1764, of respectable tradespeople with good connections. Her maiden name was Ward, but in her twenty-third year, at Bath, she married William Radcliffe, a graduate of Oxford and sometime student of law, who became proprietor and editor of the weekly *English Chronicle*. She took
to writing to pass the time when alone, and as early as 1789 published The Castles of Aitkin and Doncaster, which was followed by Sicilian Romance (1790), The Romance of the Forest (1791), The Mysteries of Udolpho (1794), and The Italian (1797). For the last she received £800; for its predecessor, £500. From this time she published no more novels like an actress in full possession of her applauded powers,' says Scott, 'but chose to retreat from the stage in the full blaze of her fame. She travelled with her husband abroad and all over England and Wales, and the jottings in her journal show how keen an eye she had for natural scenery, and how she shot up her narrative with ruined abbeys. She was a modest and amiable woman, who did not publish herself nor sink the gentlewoman in the writer. So little was she known to the public that in her own lifetime there was widely current an absurd story that her mind had given way under the horrors; Crabbe Holingson preferred her stories to Waterlow; and so sagacious a writer as Dunlop could write, 'life has few better things than sitting at the chimney-corner in a winter evening and reading such absurdities.'

**Radcliffe, John**, physician, was born at Wakefield in Yorkshire, in 1659, and studied at Oxford, passing M.A. in 1672, and M.B. in 1675. Beginning practice, he immediately saw himself conscious by the originality of his ideas, claiming to take nature for his guide, and in less than two years was on the high road to celebrity. In 1692 he became M.D., and in 1694 removed to London, where he soon became the most popular physician of his time. It is said that his conversational powers, ready wit, and pleasantry contributed to the result quite as much as his professional skill. In 1696 the Princess Anne of Denmark made him her physician; and after the Revolution he was selected by William. In 1694 he was called upon to attend Queen Mary, when attacked by the smallpox, and did what he could to save her, but in vain. In 1713 he was elected M.P. for Buckingham. He had a country-house at Carshalton, and here he was living in 1714 when Queen Mary was attacked with what proved to be her last illness. Dr Radcliffe was summoned to attend her; but he was ailing, and either could not or would not come. The queen died in August; and the populace were so enraged against Dr Radcliffe that he dared not again show his face in London. He must have been really ill when sent for to the queen; he died of apoplexy at Carshalton on 1st November 1714, and was buried at Oxford in St Mary's Church. He bequeathed the bulk of his large property to a public use; leaving £40,000 for the erection of the Radcliffe Library, whose books were transmitted in 1861 to the University Museum; while the building now serves as a reading-room for the Bodleian (q.v.). Other bequests were made to University College and St Bartholomew's Hospital, London.

**Radcliffe, See Derventwater.**

**Radcliffe, John, Joseph, Count, an Austrian field-marshal, was born at Trzebnitz Castle near Tabor in Bohemia, on 2nd November 1766. Entering the Austrian army in 1784, he made his first campaign against the Turks in 1788-89, and afterwards fought in nearly all the wars waged between the Lombaro-Venetian territories, and five years later was made general marshal. In the people of Lombardy rose in revolt against Austrian rule in 1848 Radetzky, an old man of eighty-two, after five days' street fighting, was driven out of Milan. Concentrating in Verona and Mantua, he proved the chief staying-power of the House of Hapsburg during the 'year of battles in Italy. Nevertheless he was defeated by the king of Sardinia at Goito on the Mincio, when marching to the relief of Peschiera, in May. Peschiera capitulated immediately afterwards. Having received heavy reinforcements, Radetzky towards the end of July broke out of Verona, routed the Sardinian-Piemontese army at Castozza, and on 6th August re-entered Milan. Three days later an armistice was concluded, the king of Sardinia abandoning all places east of the Ticino. On the resumption of hostilities in March 1849 the Austrian general in a campaign of less than a fortnight crossed the Ticino and almost destroyed the Piedmontese army at Novara (23rd March). In the following August he compelled Venice to surrender, it having been in revolt since 1848. After this Radetzky was appointed governor of the Lombard-Venetian territories, and led them with an iron hand until the beginning of 1857. He died at Milan on 5th January 1858, and was buried at Metzdorf near Vienna.

See his own Denkschrift (1867) and his Briefe an seine Tochter. He was the father of Krones, Strack (1849), Schneidewind (1851), Schönlaub (1858), Trubetzkoi (1860), Kunz (1900), K. von Duncker (1891), Smolle, Krones, Grasser, Bancalari (1892), and Hübner, Der Anzeiger der Prov (1891).**

**Radhanpur**, chief town of a protected state in Bombay Presidency, India, 150 miles N.W. of Baroda. It is surrounded with walls and encloses a fortified castle, the residence of the native prince. Pop. 14,722. The area of Radhanpur has an area of 1150 sq. m. Pop. of 12,950.

**Radient Energy.** See ENERGY

**Radient Matter.** See VACUUM TUBES.

**Radilata**, one of the four embranchments into which Cuvier (1812) divided the animal kingdom, the other three being Articulata, Mollusca, and Vertebrata. In the division Radilata Cuvier recognised five classes—viz. (1) the Echinodermata, (2) the Entozoan (or Entozoon Worms), (3) the Arachnidae (or Jolly-fish), (4) the Polypida (Hydroids and Polyzoa), and (5) the Infusoria (Rotifers and Protozoa). It is hardly necessary to say that this exceedingly heterogeneous assemblage, or 'radiate phyla,' as Huxley termed it, is now broken up into numerous distinct classes.

**Radiation.** See HEAT.
Radical, in Chemistry, is a term applied to a group consisting of two or more elementary atoms which is capable of entering into a series of different compounds without itself undergoing change or decomposition. In this respect a radical resembles an atom of an elementary substance. Radicals are, in a sense, incapable of a separate existence, and must be in combination with other radicals or elements. Two similar radicals can, however, combine with each other, and in such cases the combined product has been looked upon as the radical in the free state. The radical methyl, CH₃, consisting of one atom of carbon and three atoms of hydrogen, is known in combination with chlorine, iodine, oxygen, and sulphur in the respective compounds, methyl chloride, CH₃Cl, methyl iodide, CH₃I, methyl oxide, (CH₃)₂O, and methyl sulphide, (CH₃)₂S.

Two methyl groups occur in combination with each other in the substance ethane or dimethyl, (CH₃)₂H. A very large number of other compounds contain the radical methyl.

The nitrates, the nitrites, and the acetates contain the respective radicals SO₄, NO₃, and C₄H₉O. These are frequently called the salt-radicals of the respective series of salts. In double decompositions the salt-radical occurring in combination with one metal is transferred, without decomposition, to another metal. For instance, the equation

\[ \text{MgSO₄} + \text{Ba(NO₃)₂} = \text{BaSO₄} + \text{Mg(NO₃)₂} \]

represents the mutual exchange of salt-radicals by the metals magnesium and bariuin.

In chemical notation short symbols are frequently employed to represent complicated radicals. Thus, the complex salt-radical of the tartrates, C₄H₉O₆, is shortly represented by the symbol T. Tartaric acid is then represented by H₂T, potassium tartrate by K₂T, potassium hydrogen tartrate (cream of tartar) by KHT, &c.

Radical, in English politics, is often used to denote the advanced wing of the great Liberal party. The name seems to have been first used in the reign of George III. in the phrase ‘radical reform’ (Anti-Jacobin, 1797 and 1798), though one instance at least occurs much earlier in the Remains of Archbishop Leighton, written in the reign of Charles II. (see Root AND Branch Men). But the modern radicals are descendants of the French Revolutionists of 1789. The principal objects of the men so designated have been chiefly concerned with parliamentary reform, the extension of the franchise, the enlargement of the public privileges of the people, and with endeavouring to weaken and curtail the exclusive privileges and prerogatives of the oligarchical ruling classes. In a word, the radicals of England have been the pioneers of the democratic movement, and have sought to achieve their ideals almost exclusively through the agency of parliamentary government. The word is meant to indicate the thoroughness of the reforms advocated, being derived from the Lat. radix, ‘a root.’ Inseparably associated with the great reform movements of the 19th century, the radicals began to be generally so called about 1816; and the name figured prominently in the movements in which Orator Hunt (q.v.), Thistlemwood, Watson, and others played the chief parts. A clever poem setting forth the nims of these men, entitled The White Hat (1819)—i.e. the hat of Hunt, nicknamed King Harry the Ninth—and written by J. W. L. Swire, will be found in Notes and Queries, series 3, vol. x. p. 436. See also W. Harris, History of the Radical Party in Parliament (1885); and S. Bamford, Life of a Radical (1842).

Radiolaria, a class of marine Rhizopod Protozoa. Thread-like processes of living matter radiate outwards on all sides; a membranous capsule with fine pores, or with one or more sertapines, separates an internal unclotted region of the cell from an outer part supported by a gelatinous framework; there is a hard skeleton of silica or of a ‘horny’ material called acanthin. They multiply by dividing or by forming spores within the central capsule. Most of the Radiolarians are minute, under \( \frac{1}{4} \) of an inch, but a few which form colonies may measure an inch or even 4 inches in length. Most of them include ‘yellow cells’ or algae, with which they live in a partnership known as Symbiosis (q.v.). Radiolarians occur in all seas, in every latitude, and at all depths, though many kinds predominate on the surface, where they are, wafted about by currents. The siliceous skeletons form most of the ooze which has been dredged from depths of 2000 to 3000 fathoms. Fossil forms are abundant in certain deposits—‘Barbadoes earth,’ ‘Tripoll powder,’ and various marls, &c. See Haeckel, Report on the Radiolaria (Challenger Reports, xvi., 1857).

Radiometer, an instrument consisting of four horizontal arms of very fine glass, carefully poised so as to revolve easily on a point; the tips of the arms having pith discs blackened on one side. The whole is contained in a glass vessel almost but not quite exhausted of air. When exposed to light or heat the arms move round, more or less swiftly according to the strength of the rays. The blackened sides of the vanes are warmer; the molecules of air striking those sides are more heated by the vanes; they rebound after impact with greater velocity; the vanes are driven back by a greater recoil on the blackened sides. The radiometer was invented in 1873-76 by Crookes (q.v.).

Radiophone, an instrument, essentially similar in principle to the Photophone (q.v.), for producing sound by means of heat rays.

Radish (Raphanus), a genus of plants, of the natural order Cruciferae, having a spongy Silique (q.v.). The flowers are yellow, red, or purple. The Common Radish (R. sativus) has thick, round, tapering, and pointed pods, little longer than their stalks, very slightly contracted between the seeds, and not falling to pieces. It is not known in any country in a wild state, but has been cultivated from time immemorial in China, Japan, India, and in Europe. But some varieties of the Wild Radish found growing on the Mediterranean coasts resemble...
so closely the Garden Radish as to suggest the possibility that the latter may be but a cultivated race of it. Radish is a well-known salad root, much appreciated for its succulent roots with their warm pungent flavor. In this respect young and tender leaves were also formerly used. The varieties of radish in cultivation are extremely numerous, but they are generally classified under the two heads of Long-rooted and Turnip-rooted Radishes, the roots of the former resembling the carrot in shape, and the latter the turnip. The varieties differ very much, not only in form of root, but in colour and size, a red colour generally prevailing. Some of the darker-coloured turnip-rooted radishes, such as the black Spanish, grow to a large size under good cultivation, and are grown in gardens chiefly for their root; and the surface generally is not grown. Radishes are sown at different seasons, and are generally used when young and small. The root of the radish possesses demulcent, stimulant, and diuretic properties, and is sometimes used in cases of atony, or of excessive secretions of mucus by the organs of respiration and the primary organs. Radish-juice, mixed with sugar-candy, is a popular and useful German remedy for hoarseness and cough. Distinct from both the varieties above named is the Oil Radish, which is a nearly fleshy-rooted, short, much-branched stem, and many-seeded pods. It is cultivated in China for the oil of its seeds. Another species of radish (R. caudatus), a native of Japan, is there cultivated as an esculent. To this genus belongs the Jointed Charlock of the cornfields (R. raphanistrum), which has found its way from Europe to North America, and is a troublesome weed there also. The seeds, however, may be advantageously crushed for oil. The Sea Radish (R. maritimus) is a rarer British species, the roots of which are of fine quality and great pungency.

Radius. See CIRCLE.

Radley, a Berkshire village, near the right bank of the Thames, 5 miles S. of Oxford. The Bowyers' seat here was in 1847 converted by Professor W. Sewell into a High Church public school—St Peter's College—for 130 boarders. It has a fine chapel.

Radnorshire, a border county of South Wales, bounded by the counties of Montgomery, Salop, Hereford, Brecon, and Cardigan. Measuring 30 miles by 30, and 432 sq. m. in area, it is the tenth in size and twelfth in population of all the twelve Welsh counties. The beautiful Wye traces all the south-western and southern boundary, the Teifi runs through the western portion. It is hilly or mountainous, in the Forest of Radnor attaining a maximum altitude of 2163 feet. Of half-a-dozen mineral springs, those of Llandrindod are in most repute. The rocks are mainly Lower Silurian, and the soils poor, less than half of the total area being in tillage, whilst woods and plantations cover nearly 8000 acres. The rearing of stock is the principal industry. Radnorshire returns one member; and till 1885 another was returned by the Radnor district of parliamentary boroughs—Cefnllwy, Knighton, Kinmelia, New Radnor, Prestigne, and Rhayader. Pop. (1801) 19,135; (1814) 25,438; (1818) 23,528; (1891) 21,791. See Williams' History of Radnorshire (Tenby, 1838).

Radom, an old but interesting town of Poland, on a sub-tributary of the Vistula, 60 miles S. of Warsaw. It is the seat of an active trade; dyeing and the manufacture of glass are important industries. Pop. 12,402. — The government has an area of 4768 sq. m., and a pop. (1869) of 782,274.

Radovitz, Joseph von, Prussian statesman, born February 5, 1797, at Blankenburg, was the son of a nobleman of Hungarian descent, and in 1813 entered the Westphalian army as an officer. After the peace in 1815 he taught in the military school of Cassel; but in 1823 he entered the Prussian service, and in 1830 became chief of the general staff. A lover of science, he became connected with the Prussian aristocracy, and soon became the leader of the anti-revolutionary party. In 1836 Radovitz was sent as Prussian military commissioner to the German Diet at Frankfort, and held diplomatic posts at Carlsruhe, Darmstadt, and Neuburg. He was the confidential adviser of King Frederick-William IV. in his endeavours to bring about a reform of the German Diet. After the revolution of 1848 the endeavours of Prussia to give a constitution to Germany, by means of the alliance of the three kings, was principally his work. He wrote several works, mainly political, and died 25th December 1853. See Lives by Frensdorff (1850) and Fischer (1874); and Hay-ward's Biog. and Crit. Essays (1st series, 1858).

Rae, John, Arctic traveller, was born in Orkney in 1813, studied medicine at Edinburgh, and went to Hudson Bay as doctor of the Company's ships. In 1845 he undertook an exploring expedition, and in 1846-47 a number of his men were wintering in Repulse Bay. He was second under Richardson in 1848 on a Franklin search voyage. In 1853-54 he commanded an expedition that proved King William's Land to be an island. In his various journeys a nearly 1800 miles were travelled over for the first time. In 1860 he surveyed a telegraph line to America by the Faroes and Iceland, and visited Greenland; and in 1864 he made a telegraph survey from Winnipeg across the Rocky Mountains. He published reports of his expeditions, and a miscellaneous geographical work by Rae, who was LL.D., F.R.S., &c., died 24th July 1893.

Raeburn, Sir Henry, R.A., portrait-painter, was born 4th March 1756, at Stockbridge, then a village near Edinburgh, where his father was a manufacturer and mill-owner. His parents died when he was about six years old; and he was educated in George Heriot's Hospital, and apprenticed to James Gilliland, a goldsmith and jeweller in the Parliament Close. While in this employment his turn for art attracted the attention of David Deuchar, the etcher and seal-engraver, who gave him some instruction; and he afterwards studied under David Martin, producing at first water-colour miniature portraits with such success that he was soon able to devote himself exclusively to portraiture in oils. A careful miniature of Deuchar, still preserved, forms a curious example of Raeburn's earliest style. At the age of twenty-two he married one of his sitters, Ann Edgar, widow of Count Leslie, a lady of means; and, after practising his art for a time in Edinburgh, he resolved to study in Italy. In passing through London he visited Reynolds, who received him kindly, recognising his talent, and furnished him with introductions to Pompeo Batoni and other artists of Rome. After remaining two years in Italy he returned and settled in Edinburgh in 1775, the date of his fine portrait of the second Lord President Dundas. He soon received full employment as a portrait-painter, and before long attained acknowledged celebrity and fortune, and held the picture-dealing in Scotland. In 1812 he was elected president of the Society of Artists in Edinburgh; and in 1814 Associate of the Royal Academy, London; and in the following year full Academician. He was knighted by the Duke of IV. during that march's visit to Scotland in 1822, and was appointed his limner for Scotland a few days before his death in Edinburgh on the 8th of July 1823.

Raeburn's style was, to some extent, founded upon that of Reynolds. Like Sir Joshua, he aimed at
breadth of effect, a result attained by massing to-gether the lights, and keeping them as far as possible distinct from the shadows, and so making each respectively effective; but he attained his aim in a manner and with a feeling that was characteristic and original. He seldom attempted to produce textbook landscapes, but adopted the quality of execution in rigorous and semi-transparent painting, but adopted the opposite mode of painting, in a low tone, with a crisp, definite touch, working his colours with little admixture of any unctuous medium. In his portraits of men, in particular, the heads are most vigorously modelled, and the characteristic expression is seized in a singularly simple, direct, and effective manner; but works like the seated portrait of his wife and the portraits of the two Misses Grant Sutie sufficiently prove these he could portray the grace and dignity of comely womanhood. His reputation, always high in his native country, is becoming more widely spread, and his works are now much sought after. Among his portraits included above are the celebrated Scotsmen of his day, were Sir Walter Scott, Lord Melvilie, Sir David Baird, Henry Mackenzie, Neil Gow, Harry Erskine, Dugald Stewart, Principal Robertson, Lord Jeffrey, and Lord Cockburn. Technically one of his finest and most complete productions is an extensive portrait of Sir William Wardour. Exhibitions of his collected works were held in Edinburgh in 1824 and 1876; and an excellent series of his portraits was included in the Old Masters Exhibition of the Royal Academy in 1877. His art is fully represented in the National Gallery of Scotland, and examples of his brush are preserved in the National Gallery, London, and in the Louvre. Numerous engravings have been executed from his portraits.

See Life by his great-grandson, W. R. Andrew (Lond. 1886); Portraits by Sir Henry Raeburn (photographs, edited by Sir John Brown; Edin., 1870); Sir Henry Raeburn, a Selection from his Portraits (photogravures, edited by W. E. Henley; Edin. 1899).

Raff, Joachim, musical composer, was born at Lachen on Lake Zurich on 27th May 1822. He began life as a schoolmaster, but, encouraged by Mendelssohn, he devoted himself to music. From 1842 to 1845 he was musical director in a girls' seminary, then taught music at Wiesbaden until 1877; and from that year until his death, on 24th June 1882, he was director of the musical conservatory at Frankfort-on-Main. From the time he turned to music down to the end of his life Raff poured forth an incessant stream of musical productions, more than 200 in all. His works include many classical compositions, as symphonies, overtures, concertos for violin, cello, and piano, operas, quartet, a great variety of pieces for piano and violin, and for piano alone. The symphonies Lenore and Im Wald are reputed his best works. He wrote with considerable poetic charm, much fluency, and great technical mastery, but undoubtedly wrote too much: he is often diffuse, and over-elaborates insignificant themes. In Die Wagnerfrage (1892) and numerous papers contributed to the Neue Zeitschrift für Musik he advocated the works and aims of the new German musical school.

Raffles, Sir Thomas Stamford, British administrator, was born, a sea-captain's son, of Port Morant in Jamaica, on 5th July 1781. In 1795 he was appointed to a clerkship in the East India House, and in 1805 assistant-secretary to a new establishment at Penang; eventually he was made principal secretary. In 1808 he made a voyage to Malacca, respecting which place, and the East Indies in general, he collected much valuable information. In 1811 Raffles accompanied the expedition against Java (q.v.) as secretary to the governor-general, Lord Minto, who himself took the chief command. The island was captured, and Raffles appointed lieutenant-governor of it and its dependencies. Much had to be done in the way of conciliating the native princes and chiefs of the British rule. He appointed British residents at the native courts, and framed rules and regulations for their conduct. He ordered a general survey to be made of the whole island, and checked the attempts of the native sultan of Jokjakarta to expel the Europeans from Java. His efforts were, however, chiefly directed to effecting a complete reform in the internal administration. By frequent personal interviews with the natives he sought to become acquainted with their manners and character, and to educate them and civilise them; and by them he was regarded with great esteem and affection. But at length his health gave way, and in 1816 he returned to England, stopping by the way at St Helena, where he had an interview with Napoleon. On his arrival in England he wrote his work Jawa (2 vols. 1817), and received the honour of knighthood. Java having by this time been restored to the Dutch, Sir Stamford Raffles was appointed lieutenant-governor of Bencoolen, a settlement on the coast of Sumatra, where he landed in March 1818. Shortly afterwards, to paralyse or combat the commercial prosperity of the Dutch in the eastern seas, and to repress the piratical propensities of the Malays, he was sent to form a new settlement at Singapore. In 1824 he was again compelled by ill-health to return to England. But the vessel in which he set sail took fire 50 miles out from Sumatra, and the crew and passengers escaped with difficulty in the boats. By this accident Sir Stamford Raffles lost the greatest part of his effects, including a fine collection of natural history, materials for various East Indian grammars and dictionaries, and for a history of Borneo, Celebes, Singapore, &c. After his arrival in England he lived to carry out what had been one of his favourite projects—namely, the formation of the Zoological Society of London, of which he was named president. He died on 5th July 1826. See Memoir by his wife (1830), and the Life by D. C. Boulger (1838).

Rafflesia, a remarkable genus of plants belonging to the small natural order Rafflesiaceae, an order composed entirely of parasitic plants, which consist merely of a flower, and form part of the Rhizantheae (q.v.) of Lindley. The Rafflesiaeae are natives partly of the Indian islands and partly of South America. The plants of the genus Rafflesia have neither stalk nor leaves, but are enormous flowers seated upon the roots of species of Croton, making their appearance at first as a hemispherical swelling
of the bark of the root, and, after the bark has broken, rising up in the form of a head of cabbage, whilst the perianth is covered with imbricated brown bracts, grows for a few days after it has opened. The perianth is thick, fleshy, and 5-partite. The ovule is inferior, and contains many ovules; and the anthers, which are numerous, are seated under the revolute margin of the top of the style column. After the flower has expanded it diffuses a sweet-like smell, in the manner of a honey-flower, and induces them to deposit their eggs. The largest and first-discovered species, R. arnoldi, was discovered in 1818 in Sumatra by Dr. Arnold, and was sent to the eminent botanist, Robert Brown, by Sir Thomas Stamford Raffles (q.v.). Its flower-magnificence has not been equalled, it is infested with containing almost 2 gallons of liquid, sometimes weighing 10 pounds, and is the largest of all known flowers. A smaller species, R. patnae, whose flowers are 16 inches to 2 feet in diameter, is highly prized by the Javanese as a medicine, for its strong styptic powers. R. barfoeldii, another Javanese species, is still smaller, its flowers being only 3 inches broad.

Rafn, Karl Christian, critic and archaeologist, was born at Brakesborg in Fuen, 10th January 1796, and educated at the university of Copenhagen, of which he was appointed sub-librarian in 1821. In 1825 he conducted extensive explorations in Denmark, and founded (1825) the 'Society for Northern Antiquities.' As secretary of this society he edited and published a great many ancient Scandinavian MSS., occupying about seventy volumes. He was named professor in 1826, and died at Copenhagen 29th October 1864. Among his numerous important works we may mention a Danish translation of Norse Mythic and Romantic Sagas (1821–26), and his Antiquitates Americanae (1837), in which he shows that America was discovered by Norsemen in the 10th century (see VINLAND).

Ragatz, a spa of Switzerland, in the south-east corner of the canton of St Gall, by rail 68 miles SE. of Zurich and 13 N. by W. of Chur (Coire); it stands at the mouth of the ravin leading to Pfaffers (q.v.), from which town it gets its healing waters by a stream of 18 miles long. Schelling, the German philosopher, is buried in the parish churchyard. Pop. 1896.

Ragged Schools. The Ragged School, as distinct from the Certified Industrial School, is a voluntary agency providing education for destitute children, and so preventing them from falling into vagrancy and crime. Vagrant children, and those guilty of slight offences, are provided for in the Certified Industrial School; but the two institutions are frequently combined. The movement which established ragged schools was almost simultaneous with that which instituted reformatory schools. John Lambton, a poor shoemaker at Pontefract, has the honour of originating the idea. For twenty years, up to the time of his death in 1839, he gathered the ragged children of the district round him as he sat at work. They came freely, and were taught gratuitously. The success attending his humble efforts soon led many more influential friends of the 'outcasts' to engage in the same work. In 1838 London had a Ragged Sunday School, which eventually became a free day-school. Field Lane followed in 1843. But the first ragged feeding-school was opened in 1841 by Sheriff Watson, in Aberdeen. In 1845 the Rev. Dr. Robertson, not then aware of the existence of Sheriff Watson's, opened a similar school in the Vennel, Edinburgh. Soon afterwards Dr. Guthrie's famous Plan for Ragged Schools appeared, a work which gave an irresistible impetus to the movement, and caused the author to be generally regarded as the father of ragged schools. A ragged school was founded at the Castle Hill in 1847 (since 1857 at Liberton). After this ragged schools sprang up in all parts of the land, until there was scarcely a town of any importance that had not one or more. The Education Acts—England, 1857, and Scotland, 1872—introduced the principle of compulsory attendance at school; under this provision, a large number—especially in England—was of a kind—of 'feeding-schools' find themselves compelled to continue their efforts. In places where the system has been efficiently conducted juvenile crime has sensibly diminished. These ragged schools do not receive government aid. The capitation grant of £2 10s., allowed by a Privy-council minute in 1856, was withdrawn in 1859.

Raghuvansa, a great Sanskrit epic, attributed to Kalidasa (q.v.). The subject is similar to that of the Rama-yana, but begins with an account of Rama's ancestors, 'the family of Ragin,' an ancient king of Anga (modern Madura). The epic was composed after 1821.

Raglan, Lord. Fitzroy James Henry Somerset, eighth son of the fifth Duke of Beaufort, was born September 30, 1788. He entered the army in his sixteenth year, and in 1807 served on the staff of the Duke of Wellington in the expedition to Copenhagen. He went to the Peninsula as aide-de-camp to the duke, and in 1812 became his military secretary. As Lord Fitzroy Somerset his name became a household word. He was present at all the great actions of the Peninsula campaign, being among the first to mount the breach at the storming of Badajoz; and it was to him that the governor of Badajoz offered his sword and a letter to Napoleon from Elba; he served under the duke in Flanders, and lost his sword-arm in the crowning victory of Waterloo; and the very next day he was seen practising writing with his left hand. For his brilliant military services he was made K.C.B., and received orders from several foreign potentates. He was minister-plenipotentiary at Paris in 1815, and secretary to the French embassy from 1810 to 1819. The duke was appointed in 1819 Master of the Ordnance, and Raglan again became his military secretary; and in 1826, when the former became commander-in-chief of the British army, Raglan was called to the Horse Guards as his military secretary. This office he held until the death of his chief in September 1852. He was then made Master-general of the Ordnance, and in October was called to the House of Peers as Baron Raglan of Raglan, in the county of Monmouth (q.v.). He had previously sat in the Lower House during the parliaments of 1818 and 1820 for the borough of Prato. While Master-general of the Ordnance he was sent as Commander-in-chief of the English forces to the Crimea in 1854 (see CRIMEAN WAR). The desperate infantry battle of Inkermann obtained for Raglan the baton of field-marshal; but as the campaign proceeded unfavourable comments began to be made upon his conduct of the war. During the winter of 1854–55 his soldiers suffered unspeakable privations, and hundreds perished in camp and on board transports for want of the food, clothing, and medicines which were in store, but could not be found in the confusion that prevailed—the fault mainly of the home authorities. The siege continued without much apparent success until June 18, when a general assault was ordered, and when Raglan's troops, as well as the French, received a terrible repulse. Raglan had been suffering from a slight attack of
cholera, and the disaster of June 18 weighing upon his mind, he suddenly became worse, and died of exhaustion, June 28, 1835. His remains were brought to England and buried in the family cemetery at Badminton. He proved himself to be a skilful tactician, although it may be doubted whether he had the capacity of a great general. His personal bravery won universal admiration; and his courteous and noble bearing, his gentleness of temper and firmness of mind, and his constant worship of duty, invest his character with something of the chivalrous. See Kinglake, Peace be with Conmen (1863-87); and Hanley, The War in the Crimea (1891).

Ragman Roll (ragman, a word of uncertain origin, used in ancient diplomatic language for an indenture or legal deed), the name given to the collection of instruments which record the acts of fealty and homage performed by the Scottish nobility and by the great of England, during his military progress through Scotland in 1296, and afterwards at the parliament held at Berwick. The original instruments of homage under the seals of the parties were deposited in the Royal Treasury of England, and have almost entirely perished; the rolls of homage in Westminster Palace preservcs a record of them. Its contents were given in an abridged form in Prynne's Records, and afterwards printed in extenso by the Bannatyne Club in 1834. An especial value attaches to the Ragman Roll as containing the largesl evidence of the extraordinary extent of the nobility, barons, landlords, and burgesses, as well as of the clergy of Scotland, prior to the 14th century, and the only genuine statistical notices of Scotland of the period.

Ragouarâck (Ger. Götterdämmerung), the end of the world, when the gods (Odin, Thor, &c.) shall be overcome by their enemies and the world be burned up. See SCANDINAVIAN MYTHOLOGY.

Rags. Fragments of almost all kinds of textile materials have now a commercial value. In the middle of the 19th century all white papers were made of rags, but the great increase in the consumption of printing-papers for daily newspapers and cheap periodicals has for many years necessitated the use of other materials, such as esparto, woodfibres, &c. (see PAPER). Linen and cotton rags alone are still, however, used for bank-note and other fine and strong papers, and are mixed with other materials, such as wood-pulp, for inferior kinds. These rags furnish the manufacturer with a material already half milled into paper, so to speak, because the preliminary processes of boiling out the silica, &c. from straw or esparto are not required in the case of woven linen or cotton. Hence rags of vegetable fibre will always be valuable for paper-making.

Woollen rags have a higher value than linen or cotton kinds, or at least than mixtures of these. Old woollen clothes or shreds of such are called, in the manufacturing districts where they are worked up, Old Mungo (see SNODDY). These rags either are bought up, or "ground up," as it is termed, and re-manufactured into coarse flannels, druggers, comforters, &c. Some are actually ground into a sort of powder for flock wall-papers. The imports of linen and cotton rags into Great Britain in 1863 (before esparto was much in use for paper-making) amounted to 25,267 tons, valued at £300,681. In the same year 14,417 tons of woollen rags, valued at £551,824, were imported. In 1889 the imports were, of cotton and linen rags, 42,443 tons, valued at £426,522, and of woollen rags, 31,305 tons, valued at £660,438 (217,000 tons of esparto fibre were imported in the same year). A comparison of these figures will show the increased quantities now imported, as well as the depreciation in the value of rags. A large quantity, probably amounting to from one-third to one-half of the amount of British imports of linen and cotton rags, is re-exported to the United States; or at least rags to this extent are exported from England thither, but a certain proportion of them may be of British production.

Ragstone, an impure limestone, consisting chiefly of lime and silice, much used in Kent. It breaks up into pieces about the size of a brick, and is hard and flat bedded. The name is also applied to the hard irregular rock which frequently overlies the building marl, and is used for building purposes, bones or sharpening stones for sayetly, &c. are made of it.

Ragusa (Slav. Dubrovnik), a decayed city of Dalmatia, stands on the east shore of the Adriatic, 100 miles S.E. of Spalato and opposite the Gulf of Manfredonia in Italy. It is surrounded with strong walls, and has a very picturesque appearance when viewed from the sea. The city seems to have been colonised by refugees from Epidamnum (now Old Ragusa, a few miles to the south-east), Salona, and other Greek-Roman towns destroyed by the Slav invaders of the Balkan peninsula. For some centuries Ragusa was a Roman outpost on the edge of the Slav states, and flourished greatly under the protection of the Venetian Republic. Towards the end of the 12th century Ragusa was made to acknowledge the supremacy of Venice, though she retained a large share of autonomy. In 1338 Venice ceded her Dalmatian possessions to Hungary, and that time down to the era of the Napoléonian wars Ragusa was generally destined to look to Hungary (i.e. the German empire) for help against her enemies, although from the beginning of the 15th century she was a free and independent republic. It was at the same time that she began to take a prominent place amongst the trading states of the Mediterranean, her prosperity being due to her position between the Christian powers and the empire of the Turks, and the privileges she enjoyed of trading freely with the subjects of the sultan. Her cargoes (i.e. "vaghi") were sent either to the Baltic; and a contingent joined the great Arundan when it set sail for the invasion of England. Ragusa was the home of the middle of the 15th century of a remarkable literary movement, stimulated by the Renaissance (see Servia). During the course of the Napoléonic wars the French entered the city in 1806; this led the Russians to bombard the place. But in 1809 Napoleon declared the republic of Ragusa to be at an end, and in the following year incorporated it in the kingdom of Illyria. Since 1814, like the rest of the Dalmatian seaboard, it has belonged to Austria. Ragusa had, however, long before this declined from her former greatness. Through spared the attacks of foreign foes, she suffered repeatedly from fires, plagues, and earthquakes. The earthquake of 1667 was particularly disastrous. Yet Ragusa still contains several striking and interesting buildings, chief amongst them the palace of the rectors (chief magistrates), built in the Gothic and Classic Renaissance styles between 1433 and 1464; the custom-house and mint, dating from before 1312 and finished in 1520; the Dominican church (1360) and monastic buildings, and several other buildings in the picture by Titian; the Franciscan church and monastery (1517); the church of St. Biagio (Blaise), the patron saint of the town, built in 1348-52, but rebuilt in 1719; and the churches of San Salvatore and Alle Dune. The old cathedral, which tradition says was founded by Richard I. of
RAGUSA

England when on his way home from Palestine, was destroyed by the earthquake of 1667; its modern successor (1671-1713) possesses some valuable silver ornaments and curiosities. There is also a large Jesuits' church (1690-1725). The harbour is small and now sanded up. Merchandise is landed and embarked at the harbour of Gravosa, a short distance to the north. Pop. 7245.

See T. G. Jackson, Dalmatia (vol. ii. 1857), and Pypin and Spanheim, Geschichte der slavischen Literaturen (vol. i. Leip. 1860), where the best books are quoted.

Ragusa, an old town in the south of Sicily, 31 miles WSW. of Syracuse, stands on the right bank of the Ragusa, 14 miles from the sea. In the cliffs below the walls and around the town ancient tombs have been excavated. A neighbouring grotto yields stones impregnated with porphyrion. Ragusa is supposed to occupy the site of the ancient Hybla Herae. It consists of two communies—an upper, with 24,183 inhabitants, and a lower, with 6290.

Ragwort, the common English name of those species of Senecio (q.v.) in which the heads of flowers have a spreading ray, the involucre has small scales at the base, and the leaves are pinnatifid. The British species are large coarse weeds, with erect stems, and yellow flowers; one species, the Common Ragwort (S. Jaco-

Common Ragwort (Senecio Jacobea).

...and another collection. See also her correspondence with Veit (1861) and with Varnhagen (1875); and books on her by Schmidt-Weissenfels (1857), Assing (1877), and Mrs Jennings (1876).

Railway, a manufacturing city of New Jersey, on the Railway River, 4 miles from its mouth, and 20 miles W. of New York. Pop. (1900) 7633.

Rai Bareil, or Rai Bareil, a town of Oudil, India, stands 48 miles SE. of Lucknow, and has a large brick fort (15th century), a magnificent palace and tomb of a former ruler, and some fine mosques. Pop. 11,731.

Ralfseisen, Friedrich Wilhelm (1818-88), born at Hamm, near Coblenz, held various posts in the Prussian government service, but is known as the founder of the agricultural banks on a principle similar to the people's banks of Schultze-Delitzsck (q.v.) now found all over Germany, Austria, Switzerland, and Italy. He wrote several books in exposition of the system. See CO-OPERATION.

Raihes, Robert, originator of Sunday-schools, was born at Gloucester, September 14, 1735. His father was printer and proprietor of the Gloucester Journal, and he succeeded to the business, keeping it till 1802. He loved children all his days, and his pity for the misery and ignorance of many in his native city led him about 1780 to start a school where they might be taught to read and to repeat the Catechism. In the columns of his journal attracted attention, the movement grew, and Raihes himself lived to see his schools widely spread over England. He died 5th April 1811, and was buried in the church of St Mary de Crypt, Gloucester, all the children that attended his funeral being given by his directions a shilling and a plum-cake. See Lives by Gregory (1877), Eastman (1880), and Harris (1899).

Rail (Rallus), a genus of birds of the family Rallidae, having a slender bill rather longer than the head, wings of moderate length, long, powerful legs, and very long, completely-divided toes. The only European species is the Common or Water Rail, or Bilecock (R. aquaticus), found in marshy districts throughout England and in many parts of Scotland and Ireland. Many of the birds migrate southwards on the approach of winter. Like most of its relatives, the water-rail is very shy in its habits, and though it does not readily fly, generally escapes detection by threading its way swiftly and quietly through the reeds when its nest is approached. During the breeding season, however, it frequently utters a loud, harsh, groaning cry.

Water-rail (Rallus aquaticus).

The nest of the rail is made of coarse grass or reeds, usually well hidden among thick aquatic plants. The eggs, numbering seven to eleven, are 'pale creamy-white, sparsely flecked with reddish brown and ash-gray.' Two broods are reared in a season. The food consists of worms, snails, and soft vegetable substances. The adult bird is about
a foot in length; the prevailing colours of the plumage are olive-brown on the upper, ash-gray on the under parts. The tints of the female are duller than those of the male, while the young bird has the under parts creamy-white, barred with brown. Nearly allied to the water-rail are the Moor-hen and the Corn-crake (q.v.). Typical of the American rails is the Virginian Rail (R. virginianus).

**RAILWAYS**

The addition to tractive power through the diminution of friction to be obtained by the use of rails upon a road appears to be so obvious a fact in mechanics that it is not surprising to find records from very early times of the employment of various materials with this object (see TRAMWAYS). Stone or wood was first used, but towards the end of the 18th century the improvements in the production of iron permitted the substitution of that metal on lines laid down in collieries and quarries. The employment of steam-power for locomotion on ordinary roadways was the subject of numerous experiments in various countries during the 18th century, but the credit of producing the first practical working engine is ascribed to Nicolas Joseph Cugnot (1725-1804), a native of Void in Lorraine. His carriage, constructed in 1769 at the French National Arsenal at the cost of the Comte de Saxe, ran on three wheels, and had two single-acting cylinders turning the front wheel. In the United States Oliver Evans (1755-1819) in 1804 constructed a steam dredging-machine which propelled itself on wheels to the river, a distance of 15 mile. The improvements of the steam-engine effected by the inventions of James Watt soon led to better forms of locomotives, and comparatively successful models were produced by William Murdock; by William Symington of Dumfarton, the pioneer of steam navigation; and later by Richard Trevithick, whose steam-carriage was exhibited in London in 1805. The development of the high-pressure engine was largely due to Trevithick’s numerous experiments and inventions. The first railway locomotive was tried, it is said, on the Merthyr tramroad in 1804, but the experiment was not successful, and to the venerable ‘Puffing Billy,’ patented in 1813 by William Henson, and now to be seen in the museum of the Patent Office, must be ascribed the honour of being the progenitor of the enormous stud of iron horses now existing in all quarters of the world. In previous experimental lines rack rails and toothed wheels had been provided under the mistaken notion that the adhesion of a smooth wheel to a smooth rail would not be sufficient. ‘Puffing Billy,’ after many trials and alterations, commenced regular working at the Wylam Colliery, near Newcastle-upon-Tyne, in 1813, and was kept in constant use until 1872, when it was purchased by the government.

A standing difficulty with the earlier forms of engine was the want of adequate and uniform steam-power, various devices being employed to secure the requisite draught to the furnace. The problem was first solved by George Stephenson. In 1815, after many previous experiments made while acting as colliery engineer, it occurred to him that the waste steam might be utilised as a blast to stimulate combustion, and from this idea, with the subsequent invention of the multitubular boiler (by Booth), securing enormously increased heating surface, the present form of locomotive was evolved. Other improvements made by Stephenson comprised the direct communication between the cylinders and the wheels, and joint adhesion of all the wheels by the use of horizontal connecting-rods. An engine constructed by him was the first to run on the Stockton and Darlington line, opened for public traffic on 27th September 1825. The engine weighed about 8 tons, and could make a speed of nearly 16 miles an hour. The Stockton and Darlington line was constructed for mineral traffic; and it was not until the opening of the Liverpool and Manchester Railway that the vast possibilities of the new form of transport were proved beyond cavil. The directors of that company, with a view to settle the method of traction on the line then approaching completion, offered a £500 prize for the best locomotive engine. Stephenson’s ‘Rocket,’ comprising the improvements above mentioned, was the only one that complied with the conditions laid down, and at the competition which took place at Rainhill in October 1829 its superiority was at once manifest. It drew a coach with thirty passengers along the prescribed course at the rate of 30 miles an hour. The ‘Rocket’ went into regular service on the opening of the railway in the following year. It weighed, with its supply of water, only 4½ tons, and long after it had been superseded by heavier engines, on one occasion ran 4 miles in 4½ minutes. All the many changes which have since been effected in the appearance and size of the locomotive have been more matters of detail than of principle. The 75-ton express passenger-engine, which runs at a speed of 6 miles per minute for miles together, does not differ materially in construction from George Stephenson’s pioneer engines.

A modern development, however, of importance...
for economy of fuel is the adaptation to the locomotive of the 'compounding' principle which has effected such a revolution in steam navigation. By this invention (see Steam-engine) the steam after doing duty in one cylinder or pair of cylinders is made available through its expansive power in another and larger cylinder. Engines formed on this plan are used extensively on the London and

North-Western Railway, the North-Eastern, and the Great Eastern. A saving of from 10 to 15 per cent. in fuel is claimed by advocates of compound locomotives, the objection being a complication of parts.

Considerable diversity has hitherto existed in the type of locomotive on various lines; but the policy now adopted by nearly all the leading companies of manufacturing their own rolling-stock, and the obvious advantage of having interchangeable parts, has led of late to the gradual adoption of a more uniform style of construction for the different kinds of service required. As a general rule inside cylinders are in use on the through lines of the United Kingdom, it being contended by many authorities that for high speeds the placing of the weightier parts of the machine close to the centre of gravity minimises oscillation. It is held further that the moving part of the machinery is better protected by being placed within the wheels. On the other hand, the objections to be urged are the increased cost and complication of the driving-axle and the comparative inaccessibility of the valves and pistons for purposes of repair. Outside cylinders have been adopted on the London and South-Western Railway and on other lines, and, supported by the bogie-truck, this form of engine approximates closely to the type in use on American railroads. The bogie-truck consists of a separate frame carried by two or more sets of wheels and attached to the engine or carriage by a central pivot; by this contrivance the wheels adapt themselves more readily to inequalities or to sharp curves. The boiler on English locomotives is invariably carried on a stiff plate frame, while in the comparatively cheaper form in use in the United States the running portion of the machinery is attached directly to the boiler by means of a bar frame, which in Britain is thought to throw undue strain upon the structure.

But that it may, the types of passenger express engines in England and in the United States are undoubtedly approximating more and more closely (see fig. 4). The large single-driving wheel at one time generally used on express locomotives is now more rare, except in the case of some of the new compound engines, but for high speeds it possesses some advantages. For goods-engines the six-coupled wheel, inside cylinder type, is in most general use, while the forms of tank-engines for local and suburban lines and for shunting purposes vary with the different companies and the different services to be performed. Of acces-
series to working perhaps the most important added in recent years is the injector, a contrivance for picking up water in transit from troughs placed between the rails. It is the invention of Mr Ramsbottom of the London and North-Western Railway, and is in use on some lines where long distances are run without stopping.

In the matter of fuel some very successful experiments have been made on the Great Eastern Railway in the use of oil refuse in conjunction with coal, and liquid fuel is now employed on several of the company’s locomotives and stationary engines (see Fuel). The use of liquid fuel by itself in locomotive work is open to course to some objections, such as the starting of the fired and the sudden reduction of temperature when the fuel is shut off, but these do not apply where the two

planted ordinary forms of railway construction may be mentioned the atmospheric railway described at Pneumatic Despatch. Later developments in the form of electrical power (see Electric Railways) promise in the future more formidable rivalry.

The overhead railways of New York are supported on iron columns, and traverse the principal streets, affording accommodation to an enormous number of passengers. Liverpool has also adopted an overhead railway for communication along the line of docks. The project for the carriage of ships and their cargoes by railway was brought to a practical test by the Chignecto Ship Railway (1889–92), across the narrows neck connecting Nova Scotia with the mainland. Lines have also been surveyed across the Central American isthmus. The rack system of railways, which was the earliest form of iron road, has been since adopted with advantage for the working of lines having steep grades. The Mont Cenis (1863) and Rigi Railway (1871) in Switzerland are among the best-known instances of this form of construction. The Zermatt Railway, 22 miles in length, opened in 1891, is the best example of the ‘combined’ working. The engine (metre gauge) has four cylinders, the outer pair of which are connected with wheels running on ordinary rails. The inner pair operate a central toothed wheel which runs on a single rack laid on such portions of the line as are of steep gradient. The two sets of cylinders can be worked separately or together as required.

A similar line has been constructed ascending Pike’s Peak in Colorado to a height of 14,134 feet. The highest points at which the locomotive are Galera, a village in Perí, 15,635 feet, and those touched by a line from Galera rising 215 feet higher. The railway crossing the Andes in South America, from Buenos Ayres to Valparaiso, in to be worked for some 17 miles, and on part of the state railways in Bosnia and Herzegovina it is employed.

The Lartigue system of light railways of which several short lines have been constructed—one in Ireland and others in France—comprises only a single rail. The carriages or receptacles for goods are balanced on either side, pannier fashion, on a pyramidal structure of wood or iron, 3 or 4 feet in height, which carries the rail (fig. 8). A ‘bicycle’ railway has been proposed and an experimental line constructed in the United States, the engine and carriages being retained on the single rail by an overhead support held between small horizontal

wheels. In the French ‘gliding railway’ (1888) a thin film of water is kept between the rails and the sledge which supports the carriage.

Carriages.—The builders of the earliest railways did not intend them for passenger so much as for goods traffic. On the Stockton and Darlington

Fig. 6.—Elevated Railway, Sixth Avenue, New York.

Fig. 7.—Train on the Manitor and Pike’s Peak Railway.

fuels are interchangeable. The consumption and cost of coal alone per mile passenger express train may be taken at 84 lb. of fuel and 3½d. To do the same work 10½ lb. of liquid fuel and 15 lb. of coal are used, say 2½ lb., at a cost of 2½d. Of various contrivances designed to supersede or sup

pleent ordinary forms of railway construction may be mentioned the atmospheric railway descripted at Pneumatic Despatch. Later developments in the form of electrical power (see Electric Railways) promise in the future more formidable rivalry.

The two sets of cylinders can be worked separately or together as required.

A similar line has been constructed ascending Pike’s Peak in Colorado to a height of 14,134 feet. The highest points at which the locomotive are Galera, a village in Perí, 15,635 feet, and those touched by a line from Galera rising 215 feet higher. The railway crossing the Andes in South America, from Buenos Ayres to Valparaiso, in to be worked for some 17 miles, and on part of the state railways in Bosnia and Herzegovina it is employed.

The Lartigue system of light railways of which several short lines have been constructed—one in Ireland and others in France—comprises only a single rail. The carriages or receptacles for goods are balanced on either side, pannier fashion, on a pyramidal structure of wood or iron, 3 or 4 feet in height, which carries the rail (fig. 8). A ‘bicycle’ railway has been proposed and an experimental line constructed in the United States, the engine and carriages being retained on the single rail by an overhead support held between small horizontal

wheels. In the French ‘gliding railway’ (1888) a thin film of water is kept between the rails and the sledge which supports the carriage.

Carriages.—The builders of the earliest railways did not intend them for passenger so much as for goods traffic. On the Stockton and Darlington

fuels are interchangeable. The consumption and cost of coal alone per mile passenger express train may be taken at 84 lb. of fuel and 3½d. To do the same work 10½ lb. of liquid fuel and 15 lb. of coal are used, say 2½ lb., at a cost of 2½d. Of various contrivances designed to supersede or sup
line. Ordinary coaches placed on suitable wheels were used for the early passenger business, which was encouraged, and until comparatively recent years the coach was the model for railway-carriage builders. Third-class passengers were accommodated in open wagons, with or without seats. So late as 1845 many of these vehicles had no windows, and were variously painted and fitted by venetian blinds. On several of the lines no lamps were supplied in third-class carriages even for the night journeys. The first-class passengers booked their tickets as in coaching days, and their luggage was packed on the roof of the carriage in which they were allocated. As the passenger traffic increased the public became more exacting in its demands, and gradually more attention was given to the comfort of passengers, and the tendency of modern management is to add to the luxuriousness of the carriages, especially in long-distance trains. On account of the gradual decrease of second-class passengers, many of the principal companies abolished that class; but, owing to the companies who still retain it lowering the rates nearly to the level of third-class, the numbers have considerably increased again in 1886-97. Composite carriages for first- and third-class passengers are usually supplied in long-distance journeys and every comfort for both classes. Drawing-room, luncheon, and dining cars are also provided for day expresses; and sleeping-cars for night trains are fitted with all the luxury of a first-class hotel. There were in 1887 of locomotives in England 16,600, in Scotland 7,877—total 19,479; of carriages: England 51,284, Scotland 7,163, Ireland 295—total, 61,411; of wagons: England 493,428, Scotland 136,017, Ireland 18,030—total, 647,475.

The cost of the passenger express locomotive may be put at from £2500 to £3000; the more powerful engines, if made by locomotive builders, would cost from £4000 to £5000, but, like most of the carriages and wagons, they are usually built by the companies themselves. A goods-engine such as that illustrated in Fig. 5 costs about £250 and a tank-engine (without tender) £1500 to £2000. The cost of a Pullman carriage is from £2000 to £3000; of an ordinary first-class carriage, £350 to £700; second, £430 to £900; third, £380 to £450; of a coal wagon carrying eight tons, £60 to £70; of a goods wagon carrying ten tons, £72 to £80;

**Brakes.**—The supply of brake-power has been the subject of many ingenious patents, and is dealt with in a separate article in this work. The use of continuous brakes of some approved form on all passenger-trains in the United Kingdom was made compulsory by the Railway Regulations Act of 1889. See the article **Brakes**.

**Railway Construction.**—The cost of constructing railways is dependent on many conditions, such as cost of labour, the nature of the district traversed, and value of the land required. In England the last-named item has been a very serious one, and heavy parliamentary expenses have also added largely to the cost per mile, which, including equipment, averages £44,710 for the United Kingdom. The most expensive railway system in the world is the London, Midland, and Scottish lines, including the 'Tun- Circle' line of London. A circular railway of this description was recommended by a parliamentary committee in 1894. The scheme has been carried out by two companies, the Metropolitan and the Metropolitan District, which have since extended their respective systems into the suburbs. This circle, including the purchase of land, which was the heaviest item, has cost from £600,000 to nearly £1,000,000 per mile. The Metropolitan line from Bishop's Road to Farrington Street was opened on 10th January 1863, but the circle, owing to financial and other difficulties, was not completed until October 1884. Another very costly section of railway is that of the South-Eastern between Charing Cross and Cannon Street, London, which includes two large stations with hotels and two bridges over the Thames in its length of two miles. The cost of this short piece of line has been over £1,000,000 per mile. In other countries the land acquired has been of much less value, and in many cases has been given by the government. Moreover, the traffic has not been so heavy, and consequently lighter works have sufficed than those which the Board of Trade require in Great Britain. The average cost of railways in the United States are thus under £12,000 per mile, and in Western Australia the railways have been built and equipped at about £4000 per mile. In flat tracts, such as the prairies, where the traffic is light, the rails can be laid with but little prepared roadway; but this is an exceptionally favourable condition, engineers in most cases having to span rivers (see **BRIDGES**), pierce hills or mountains (see **TUNNELS**), cut through elevations, and carry the line over low-lying ground on embankments. In an ordinary clay soil the cost of cutting and embankment may be taken at from 1s. to 1s. 3d. per yard, with about 2d. extra for trimming slopes, &c. In the case of chalk, hard rock, or sand the cost would naturally be much higher; and the length of cartage is also another important item. The cost of ballasting the rails is usually, up to the bed of gravel, burned clay, or other suitable material is laid, and in this are imbedded the 'sleepers,' to which the rails are fixed. A good navvy will dig and throw out into a barrow in a day of ten hours in common ground from 8 to 10 cubic yards, or 5 to 7 cubic yards in areas of ground surrounded by rails. The 'steam navvy' is now largely employed in railway work, and does in one day the work of from seventy to eighty men (see **EXCAVATOR**).

In laying out a line it is of great importance that heavy gradients and sharp curves should be avoided, as the former add to the cost of working and the latter interfere with speed. Some of the sharpest railway curves in the United Kingdom are on the Harrow gauge Paddington line, where there are curves as sharp as the sweep of Oxford Circus—of but 116 feet radius—for short lengths. This line runs to a point 700 feet above Portmadoc in less than 12 miles, giving an average gradient of one in 82, and a maximum gradient of one in 80. On the Sleaford and Bourne gauge line in Lincolnshire, where radius of the line, on the other hand, is practically level, the gradients averaging about one in 400. The advantage of an easy gradient will be seen from the following calculation: If an engine and tender, weighing together 56 tons, is capable of drawing a maximum load of, say, 40 loaded wagons, weighing 560 tons, at 25 miles per hour on the level, it will
RAILWAYS

only take the following loads over the gradients named below, and the speed would also be considerably reduced.

Before the Board of Trade will sanction the opening of a line it has to be satisfied as to the strength of the bridges, that a minimum distance of 6 feet has been left between the lines, and as to other conditions.

The form of 'permanent way' has altered considerably since the laying of the first railways. The wooden rails on the Stockton and Darlington weighed 28 lb. to the yard. The cheapening of steel which followed the invention of the Bessemer process has led to the use of that material for rails throughout the world, and the size of the rails has been successively increased until between 80 and 85 lb. per yard is the usual weight. In British railway practice the rails are supported on cast-iron chairs held by wooden wedges, and the chairs are spiked on to transverse wooden sleepers. On American and colonial lines chairs are dispensed with, and the rails are spiked directly on to the sleepers. The points are made with 'fish-plates' bolted on each side of the rails, and the bolt-holes are made oblong or elliptical to permit of the expansion and contraction of road under changing temperatures. Blocks of stone were sometimes used in the early history of railways to support the metals, but the rigidity obtained was found to be very destructive of rolling-stock, and wooden sleepers lying on gravel ballast are now almost universally employed. Iron sleepers have been found serviceable in some countries where wood is liable to the attacks of insects.

In 1830, in order to bind the agricultural and other interests in districts too poor to make or support a railway on the usual terms, the Light Railway Act was passed in 1836 to empower the construction of lines of cheaper construction and simpler working than the ordinary. To avoid the heavy parliamentary expenses, the bill gives power to a Light Railway Commission to make inquiry, and if it is satisfied, to issue orders (subject to the approval of the Board of Trade) for the construction of such railway. County, Burgh, and District Councils are also empowered to initiate such a railway, or otherwise to give the necessary capital, and the Treasury may also advance a line sum at 3½ per cent. not exceeding one-fourth of the whole capital. Several acts have been passed for the construction of light railways in Ireland as a means of relieving distress. Under the act of 1890 government voted £130,000 for this purpose.

Signals.—At a very early stage of railway working a system of signals was found to be necessary. In 1830, when the Liverpool and Manchester line was opened, a flag by day and lamp by night were adopted. A semaphore at the gateway, and in 1837 the managers of the Grand Junction Railway erected poles about 12 feet in height, with discs and lamps turned through a quarter circle by the pointsman working a lever at the base. About 1842 a semaphore signal, somewhat resembling the present form, was introduced by the Manchester, Liverpool, and Bury line. Up to 1846 there were no 'distant' signals, but in that year this extra precaution was adopted. The successful concentration and interlocking of the levers working both points and signals was effected in 1846 near Loggiators' Arns Junction, and in 1856 the first interlocking points were fixed at Willesden Junction. Since that date the interlocking and concentration of signal and point levers has made rapid progress, and of the total signals and points in the United Kingdom over 91 per cent. are thus protected. The signals now in use may be divided into two classes, as 'home' and 'distant.' The signals to 'home' are called 'advanced starting,' and 'distant,' the last named used on goods sidings. By the interlocking of points and signals, if the signalman has for instance moved a lever that opens a pair of points to enable a train to come out of a siding on to the main line, the 'home' and 'distant' signals must be at 'danger' to stop any train from approaching on the main line, and it is impossible for him to lower them.

In the working of a railway the telegraph plays a very important part. By its means trains are opened up, and the Stockton and Darlington signals are superseeded. The signalman has for instance moved a lever that opens a pair of points to enable a train to come out of a siding on to the main line, and it is impossible for him to lower them.

In 1833, however, the absolute block telegraph system was introduced. Under the absolute block telegraph system there may be more than one train in each section. Taking A and B as the stations at each end of the section, the working of the absolute block system is thus arranged: the signalman at station A gives to station B what is called the 'Be Ready' signal, which indicates the nature of the approaching train. The man at station B, if the previous train has passed his cabin, and he knows that the section between A and B is clear, repeats this signal to the next box. The train is then despatched from A, and when it approaches B, giving the warning 'Train on Line,' which the man at B acknowledges, and at once gives the 'Be Ready' signal to C, and so on. As soon as the train has passed B, the man in that box telegraphs 'Line clear' to A, who acknowledges the message. Of the double lines in the United Kingdom over 94 per cent. are worked on the absolute block system. On most single lines the 'train-staff and ticket' system is adopted. In this case, suppose there are three trains at the terminus of a line or section to proceed to the other end, the first and second trains are divided, while the third is given the only key for the box in which the tickets are placed. No train is allowed to enter the opposite end of a section until the train staff arrives, so that it is impossible for two trains to meet. The proper distance between trains running in the same direction is maintained by fixed signals, and the block telegraph is the same as on double lines. If necessary, the line is divided into sections with crossing places, each section being worked as a separate line. By the 'train-tablet' system, a circular metal disc is electrically controlled from the box, and is a combination practically a 'train-staff' and block-telegraph system combined. Mechanical details of signalling have on occasions to be superseded by manual work. In case of fog a man, generally one of the platelayers, is stationed at the foot of each distant signal to give the warning 'distant,' and to 'danger' places on the rails two detonating signals, which are exploded by the engine as it passes over them. If the engine-driver hears no explosion he knows the line is clear.
ordinary vehicles of the country. On all the lines built by George Stephenson, and most of the other leading engineers in the United Kingdom, this 4 feet 8½ inches gauge was adopted; but in 1838 Brunel, in his desire to secure Knight the attention speed and capacity of the then constructed rail- ways, determined upon a 7-feet gauge for the Great Western Railway. This brought about the now historic battle of the broad and narrow gauges. The Eastern and the Great Western (the Great Eastern), opened for traffic in 1843, had a 5 feet 6 inches gauge, the Caledonian 5 feet 6 inches, and in Ireland there were 5 feet 2 inches and 6-feet gauges. So long as lines of different gauges serving separate districts did not come into contact the inconvenience of breaks of gauge were not felt, but when the broad and narrow gauges met at Gloucester in 1845, and at other points later on, the evil effects were soon felt. Goods and passengers had to be transferred from the one set of carriages to the other, and no through services were possible until at a later period the Great Western laid a third rail to accommodate the narrow-gauge trains. So serious became the difficulties which arose through the breaks of gauge that in 1845 a commission was appointed; it reported in favour of the narrow gauge, and in August 1846 an act was passed ensuring that every passenger coming into the United Kingdom should be able to construct any railway for the conveyance of passengers on any gauge other than 4 feet 8½ inches for Great Britain and 5 feet 3 inches for Ireland. It was, however, provided that railways constructed before the passing of the act on any other gauge should be allowed to maintain their independence. The Great Western, therefore, continued to maintain its broad gauge, and as late as 1867 there were 1450 miles of line on this system, having junctions at twenty-six points with the narrow gauge. In due course, however, the Great Western realised the disadvantages of their isolation; the narrow gauge has been gradually adopted on the system, and the date fixed for the final disappearance of the broad gauge was the 20th May 1892. Parliamentary sanction has, however, been given to various exceptionally narrow gauge lines. In most European countries the gauge adopted has been about the same as the British standard, with the exception of Spain and Russia, where the gauge is somewhat wider.

Accidents.—The number of persons killed on the railways of the United Kingdom in 1890 was 1076, and injured 4721. Of those killed 118, and of the injured 1261, were passengers; but of the fatal accidents only 18, and of the injuries 496 were due to causes beyond the control of the passengers—viz. accidents to trains—the others arising from various causes, especially want of caution on the part of individuals themselves. Taking the number of passenger journeys, exclusive of those of season-ticket holders, at 817,744,046, the proportion of passengers returned as killed by accidents beyond their own control was 0.00135, and of injured one in 1,468,677. In the case of rail- way servants 12 were killed and 147 injured by train accidents, and 487 killed and 2975 injured by other accidents. The number of persons employed on the railways of the United Kingdom is estimated at 1,46,429, of whom 1,433 were killed and one in 111 injured by train and other accidents. These are very high proportions, but it is only fair to the managers to say that every precaution is taken to secure the safety of employees. Too often, however, voluntary combinations and mechanical appliances for their protection neglected by the men themselves. The proportion of deaths and injuries has moreover steadily declined of late years. It has been suggested that many accidents were due to men working overtime, railway companies have now to make periodical returns as to the hours of labour on their systems.

Speed.—Mr Worsdell, the locomotive engineer of the North-Eastern Railway, with a powerful 860 horse-power engine and a 3.75-feet gauge, attained on one occasion a speed of 86 miles an hour. On the Philadelphia and Reading Railroad in the United States in August 1891 a distance of about 3 miles was run at a rate of 90 miles an hour. Mr Stroudley, engineer of the Brighton line, said that a light engine could easily attain 100 miles an hour. The actual running time of trains is of course considerably below such limits. The fastest speed in ordinary service and the largest proportion of high-speed trains are to be found on the railways of Great Britain—the careful finish of the road, the fencing of the track, and the comparative absence of level crossings giving an undoubted advantage in this respect over all foreign systems. The best regular running-time as yet made on railways was in the ‘race to the North,’ between the East and West Coast routes, commenced in 1888. The London and North-Western in May of that year announced their intention of reducing their time between Euston and Edinburgh from 10 to 9 hours. The East Coast companies accepted the challenge, reducing their time from 9 to 8 hours. It was found that both routes was reduced to 8 hours. The distances to be covered were by the East Coast 393 miles, and by the West Coast 400; the gradients on the former being more favourable. The ‘race to the north’ was resumed between the rival railways in 1895, when on 22nd August the west route did the journey from London to Aberdeen, 540 miles, in 8 hours 40 minutes, an average of 63.3 miles per hour, including stops. The expense and risk of these high-pressure speeds led to the resignation of Mr Stroudley, who had been chief engineer of the Great Western and Great Northern railways. The fastest train now performs the journey from London (King’s Cross) to Edinburgh in 7 hours 45 minutes, to Perth in 9 hours 25 minutes, and to Aberdeen in 11 hours 20 minutes, including stops. On the New York Central in 1891 a special run was made from New York to Buffalo, a distance of 457 miles, in 440 minutes, including three stops aggregating 15 minutes. The following may be taken as the best express services now regularly running in different parts of the world in miles per hour, including and excluding stops respectively:

On the Canadian Pacific line a special train to convey the Japanese mail in 1891 performed the distance from Vancouver to Brockville, opposite the New York frontier, in 77 hours, at a speed of 30 miles an hour for the whole 2800 miles. On the Grand Trunk line the best service is 36.8 miles including stops, and 38.2 excluding stops. The best service in India is from Bombay to Calcutta, about 25 miles an hour. The distance from Mel-
bourne to Sydney is run at 33 miles an hour including stops, and 37 miles excluding stops.

Fares and Rates.—The standard English passenger fare was 7s. 6d. for a 100 mile first class, 1s. 6d. per mile second class, and 7d. per mile third class. The experience over a series of years has shown a constant increase in the volume of third-class travel, which in 1890 formed 75% of the whole passenger business in the United Kingdom. A Midland Company decided on the abolition of the second class, and in 1890 the Manchester, Sheffield, and Lincolnshire Company and the Caledonian Company partly adopted the same policy. The Midland Company, however, by running Pullman drawing-room and sleeping cars at an extra fare, practically re-established the three classes. In the United States the average fare may be taken at 1s. 6d. per mile, extra charge being made for drawing-room and sleeping cars.

The following official statistics as to the comparative fares per kilometre in the different countries of Europe were published by the French government:

With regard to goods, the charges on British railways are higher on the whole, but the speed of the goods-trains and the character of the service is superior.

With long hauls in some countries of course lower charges may be charged. The grain rates in America have been reduced to about 3¢ per ton per mile, and on Indian railways, with cheap labour and fuel, a standard of 4¢ per ton per mile has been reached.

The Midland Company, authorising the construction of the Stockton and Darlington Railway, the first used for passenger traffic, received the Royal assent on 19th April 1821. The first rail was laid on 23rd May 1822, and on 27th September 1825 the railway was opened with great ceremony. Four hundred and fifty passengers were conveyed in the first train. The train arrived at Darlington, a distance of 82 miles, in 65 minutes. When fifty years later the jubilee of the railway system was celebrated there were 10,449 miles of railway working in the United Kingdom, representing a capital cost of £300,993,000, and producing from traffic a revenue of £56,898,000, of which £24,893,000 was received from passenger fares and £32,005,000 from the conveyance of goods and minerals.

At the close of 1897 there were 21,433 miles of railway open for traffic. The authorised capital for the construction of railways was £1,089,763,095, of which English railways had £396,411,043, Scottish railways £133,857,595, and Irish railways £39,406,457. The total receipts of these railways were £233,757,054, of which £79,739,776 were to England, £105,138,357 in Scotland, and £33,531,291 in Ireland. Of the total capital stock of the railways in the United Kingdom, £103,061,275 is guaranteed, £27,321,045 debentures, £209,743,440 preferential, £425,501,582 ordinary stocks and shares, and £12,507,733 loans. The gross revenue of all the railways is derived from—passengers, £40,518,064; goods, £47,557,172; mails and parcels conveyed by passenger trains, £6,482,164; and miscellaneous items. The number of passengers carried was 1,093,420,251, of whom 935,129,879 were third-class. The total working expenditure was £30,993,950, and the profit on the gross receipts; the net receipts were £40,953,250, giving a percentage of 30% in the total capital. Of the working expenditure, £13,712,718 was for locomotive power; £4,371,121 for repairs and replacements of carriages, etc.; £8,018,880 for maintenance of permanent way, etc.; £1,185,569 for interest on money borrowed; £4,871,668 for payment to the railway companies paid £116,329 as compensation for personal injuries sustained in 1897, and £315,088 as compensation for damage and loss to goods traffic.

The railway system of the United Kingdom has not been developed according to any plan previously marked out, nor does it owe any of the changes which it now holds to support or assistance given to it by the state. It is the outcome of private enterprise carried on in very many instances under great difficulties, in spite of much national and local prejudice, and at an expenditure of capital greatly in excess of what could have been repaid under more favourable conditions. In 1830 the Duke of Wellington, then at the head of the government, was asked to appoint some engineers to lay out four or more main lines which would form the great highways for the locomotive. The duke’s reply was that he did not like railways; and Mr Goulburn, the Chancellor of the Exchequer, decided to take no action in the matter, on the ground that interference with vested interests would create an amount of opposition which the government could not withstand. Private enterprise was then supplied the railway development which the national government refused to give. The Liverpool and Manchester Railway was opened for traffic in 1830, and in 1838 there was a completed line between London and Birmingham. During the interval of the opening of these two lines—now absorbed in the London and North Western system—fifty-six acts of parliament were passed authorising the construction of 1890 miles at a total estimated cost of 45 millions.

The Railway Mania.—A later period marked with greatly increased activity of the private promoters. Parliament had required as a condition precedent of considering any new railway bills that a deposit of ten per cent. of the estimated cost should be lodged with the accountant-general by the promoters, and paid over in cash in the first five years. On the 30th of November in 1845, the latest date at which the Board of Trade would receive plans of new railways, there had been lodged 12,863 bills, with plans and sections for new railways, representing a capital of 250 millions, and required a deposit of 25 millions. The amount required for payment of the deposit exceeded by more than 20 millions the whole amount of gold and coin in the Bank of England and notes in circulation. The publication of these figures created alarm, and a panic ensued, the stocks of existing railways were greatly depreciated, and the premiums on the shares of the newly-promoted companies, which had been created by a wild spirit of speculation, disappeared, and widespread ruin and commercial disaster ensued. The result was that, of the 12,863 companies which were promoted, 1214 only survived the ordeal of parliament.

Railway Administration.—Up to 1891 there had been passed over 4000 separate acts of parliament authorising the construction of new or dealing with the railways, of which the cost may be estimated at £300,000,000. In order to compensate to some extent for the lack of original design and system in connection with the railways, the companies have resorted to numerous plans for amalgamation, fusion, purchase, or working agreements between themselves. There are at present 516 railway companies in the United Kingdom. Of the railways owned by these companies 200 are worked or leased by other companies. The
Great Western, for instance, has thirty-six railways of which it is the lessee, and has joint-ownership of four others. The movement of the traffic over the separate systems of railways is provided for under the Clearing-house Association (see Clearing-house); and in 1888 an act was passed giving to the Board of Trade authority to call for returns, and deal with the schedule of rates and charges for conveyance of passengers and goods.

The earliest railways were authorised on the supposition that they would, like canals, be highways for the use of carriers. A scale of maximum tolls was prescribed in each act, and the canal classification of goods adopted. Later on the railway companies prepared a new classification. Each railway act also contained a clause authorising the railway company to charge a reasonable sum in addition to the maximum tolls, in order to cover carriers' services, risks, and profit; and from about the year 1845 each railway act prescribed a scale of maximum charges for conveying goods. To these maximum rates most of the companies were allowed to add a terminal charge for the services of loading, unloading, covering, collection, and delivery, &c. Although the companies had thus power to charge certain rates, the maximums were seldom exceeded. The charges thus developed were not such as the traders were dissatisfied, and demanded frequent inquiries into the working of railways. Three such inquiries were held between 1858 and 1884, but the companies were on the whole acquitted of the charges preferred against them. As the result of the inquiry of 1872 the Railway Commission was appointed to specially deal with disputes between traders and the railways. In 1883 the government made an attempt to deal with the whole subject of railway rates, but it was not until 1888 that any considerable part of the inquiry was passed. The whole of 1889 and the whole of 1890 were occupied with inquiries before the Board of Trade and a joint committee of both Houses of Parliament, as to the rates and classifications of the railways, and the result has been acts which came into force on 1st August 1892, amending the charges and classifications of nine of the leading lines.

**Zone System.**—In 1889 a new departure was inaugurated on the Hungarian state railways by the introduction of the Zone system for passengers, under which each station, taken as a point of departure, is considered as the centre of one of a series of zones, which increase in a regular ratio, and in which the fares are arranged on a simple plan. This was followed by the introduction on the Austrian railway system of the Kreuzer tariff, which is a combination of the Zone and Kilometer systems; and in 1891 the Zone system was also applied in Hungary to the goods traffic.

**Results of Railway Working.**—At the time when the Liverpool and Manchester Railway was completed, ten miles an hour travelled by the fastest stage and mail coaches was about the limit of speed attainable. At that time the population of the United Kingdom was about 25 millions; in 1891 it was nearly 38 millions. At the opening of the London and Birmingham Railway there were 3928 stage-coaches, 54 four-horse and 49 pair-horse mail coaches, each being licensed to carry fifteen passengers, would represent 16,500,000 individual journeys in the course of the year, and it may be safely assumed that not more than 10 millions of such journeys were made. The number of coaches on the railways was officially stated at 82 millions of letters. In 1890 the number of passengers carried on the railways was 817 millions. On the basis of work done by stage-coaches in 1837, we should require over a quarter of a million of these vehicles to move the passengers now conveyed over the 20,000 miles of railway. On 30th November 1830 the first of Her Majesty's mails from Liverpool was conveyed by the mail-coach to the railway. The increased facilities thus afforded converted a uniform penny post from a theory into a reality when that system came into operation on 5th December 1839. In 1890 the Post-office celebrated the jubilee of the penny postage, and in that year carried nearly 306 millions of letters, and 1,400 millions of post-cards, 413,000 millions of newspapers, 199,000 millions of letters. To have conveyed this would have required more than thirty times the number of coaches which carried the mails half a century since. The news in those days was carried at an average speed of 81 miles per hour. The railways carry the mails at an average speed of over 40 miles per hour.

The total traffic in coal on the railways of the United Kingdom amounted to over 126 millions of tons in 1890. Of the total meat supply of London the railway companies convey about 64 per cent.; whilst of milk four companies alone import about 22 millions of gallons each year. The supply of vegetables, fruits, and flowers for London and other large towns is also mainly dependent on the railways. The fish trade of the country also depends largely on the railways. The statistics of recent years—in 1890, 383,000 tons of this valuable item of food supplies were conveyed by rail from the ports to inland markets.

**State Ownership of Railways.**—It may be assumed in general that railway construction has been less harnessed by state interference in the British Islands and in the United States and Canada than in any other parts of the world, and it is precisely in these countries that railways have attained their highest development. In other parts of Europe the railways, as a rule, are either the property of governments or companies which owe their existence to the initiative and encouragement of governments. Buildings of railways in France was undertaken in a much more methodical manner than in Great Britain. The country is partitioned out among six great companies, and competition has thus been entirely avoided. The government owns a third of the capital invested, and will ultimately about the middle of the 20th century become the absolute proprietor of the various systems. The state has the right to fix fares and charges, and to determine the amount of new mileage to be constructed from time to time. So far as technical skill is concerned, the railways of the country are well managed, but the accommodation provided is far inferior to that in Great Britain or the United States; passenger-trains are comparatively few and crowded, and the freight service is very slow. The main lines are very remunerative in their operations, but the local roads are mostly worked at a loss. In Germany the roads are owned and managed by the government, and political and military considerations are paramount in the working of the system. The lines have been cheaply constructed, the cost being less than half per mile that in Great Britain. The tendency in most other European countries is towards state ownership or control of railways. The Russian government since 1880 has been actively engaged in buying up private railways and leasing new ones, and at the present time some 40 per cent. of the system is owned by the state. In Belgium the whole of the lines have been so purchased by the government. In Austria only one line is a state railway.
American continent by undue legislative restrictions. State ownership has never been seriously discussed; land has been cheap or free for occupation; the distances to be traversed are great, and it is small wonder, therefore, that the iron road has become a mixed blessing, an ordinary highway. Before the date of the celebrated locomotive trial which evolved the 'Rocket,' an engine was run in America called the 'Stourbridge Lion,' a machine made in England, and imported by the Delaware and Hudson Canal Railroad Company. The first railroad in the United States was, however, begun in 1828 by the Baltimore and Ohio Company, a section of 15 miles from Baltimore to Ellicott's Mills being opened in May 1830. Horse- traction was first used on this line. American engines are now found competing with English-built machines in many parts of the world, including the British-Australian colonies.

It is, however, in the matter of carriage construction that the American railroad engineer has marked out an independent path and obtained the most striking results. For many years European railways had been fitted with the old stage-coach. The longer distances travelled on the American continent, and the republican spirit which objected to the division of classes, led to the adoption across the Atlantic of the long railroad car, with a central passage between the seats. The growing cost of horsepower and some increased attention to such details as springs, couplings, and brakes, and in the provision of such accessories for comfort and safety American railroad practice has long been in advance of that in any other part of the world. Republican simplicity of status, the demand for improved accommodation, gave rise to drawing-room, sleeping, and dining-room cars, and the stock turned out for these purposes by the Pullman and Wagner companies challenges comparison with the provision made for the travel of royalty in the Old World. The 'Vestibule' trains running on most of the trunk-lines for long distances—say between New York and Chicago—represent the highest ideal yet obtained of luxurious travelling. Railway stock of this character is mostly owned by independent companies, whose officials collect the extra money accommodation.

In the United States, nearly one-half the total mileage was constructed between 1880 (93,526 miles) and 1892 (184,428 miles), while previous to 1850 the greater portion of the railroads made were in the states bordering on the Atlantic, and were for the most part isolated lines employed for local traffic. A great development to this form of enterprise was given by the discovery of gold in California, and lines were rapidly pushed towards the centre of the continent. The great civil war at the commencement of the next decade emphasised the necessity of connecting the interior with the improved accommodation to cement the Union, and government assistance was freely given both in lands and money to the two companies, the Union Pacific and Central Pacific, which, building respectively from the east and the west, met near Salt Lake City in May 1869, the total length from the Missouri River to San Francisco being 1700 miles. Since that date five transcontinental lines have been completed, including the Canadian Pacific Railway on British territory. The rate of general railroad construction has varied considerably, but the total length was between 1880 and 1890. In 1882 11,500 miles were built, and in 1887 no less than 12,878. A large extent of this mileage was built in advance of the necessities of the districts traversed, and in other cases existing lines were paralleled, to the heavy loss of the interests concerned. These periods of over-construction and resulting competition, combined with a necessary reduction of mileage rates as the centre of agricultural production moved westward across the continent, caused at times much depression in railroad securities. The system of finance under which the companies borrow money on mortgages with floating interests (not of British railway debentures) has also caused heavy loss to investors in American railways, many of which have been reorganised, with the accompanying 'assessment' or 'wiping out' of junior securities. The average mileage constructed 1887-97 was 3,533.

To meet the effects of over-construction a system of 'pooling' receipts was adopted by the various trunk-lines. Under this plan the receipts from any given description of traffic were made into a common purse, and divided among the companies concerned in an agreed ratio. The state railroad commissions were powerless to deal with traffic originating or passing out of their respective territories; but in 1888 the Interstate Commerce Commission was appointed with federal authority to deal with questions affecting traffic. Under the new rules, the half miles of mileage, the long and short haul clause, establishing uniform mileage rates, was, contrary to the result, expected to produce disastrous results to railway revenues. The outstanding railway capital in the United States is stated to have been necessary for 568—by 64% of the company's outstanding capital, which was more than half, or $3,504,424,255 consisted of capital stock, while the funded debt amounted to $5,276,385,519. The cost per mile of completed road was $50,020. The gross earnings were $1,122,088,773, equal to 10:35 per cent. on the investment, and the net earnings $830,953, 2:47 per cent. on the outstanding capital; other sources of income amounted to $125,009,010, and the total income was $494,635,019. The interest on indebtedness was 4:99 per cent., and the average dividends on stocks 1:22 per cent. Passengers to the number of 504,106,525 were carried, with an average distance of 24:73 miles, while 788,385,448 tons of freight were carried an average distance of 124:15 miles. The average receipts per passenger mile were 2:03 cents, and per ton of goods per mile 0:80 cents, the latter a lower average than in most other countries, the distances hauled being unusually great.

Colonial and Foreign Railways.—Canadian railways follow closely in their characteristics the construction and methods of working of the lines across the boundary. The return of 1880 gives a total of about 14,000 miles completed, of which the greater proportion of the mileage being divided between two companies, the Grand Trunk and the Canadian Pacific. The nominal capital, including advances made and aid granted by the Dominion government, was $780,447,000, or $561,174 per mile. The earnings were returned at $458,444,000, and the net profits at $13,330,000. Passengers were carried to the number of 12,821,000, and 20,787,000 tons of freight.

In Mexico for many years the line from Vera Cruz to the capital, constructed in 1859 at a heavy cost by British capital, was the only railway in existence; but routes connecting with the systems of the United States were subsequently constructed under American auspices. Of railways in other Central American states the Panama line constructed by American capital, as the first link in the isthmian canal, was the first impor-

The interchange of the Atlantic and Pacific are under construction, and a great scheme, traversing the Isthmus from north to south, was discussed and steps taken for the necessary surveys at a meeting of representatives of the various republics held in 1890 at Washington. The project
vies in magnitude with the Trans-Siberian railway scheme in the Old World. The Argentine Confederation represents the chief railway development in the southern half of the continent.

In the early days of railway enterprise in India, the agencies of private companies guaranteed by the state were exclusively used. In 1867, all the great trunk-lines of the country were made under this system. The government gave the land for the lines free of charge, and guaranteed interest generally at five per cent, on the share capital and a dividend of five per cent. In ninety-nine years. Any surplus earnings after the guaranteed rates were paid were divided equally between the government and the companies. Moreover, the government retained the right of buying the undertakings at specified dates on payment of the value of the stock calculated at its market price on the average of the three preceding years. In this way the East Indian Railway was acquired in 1880, the Eastern Bengal in 1884, the Sind, Punjab, and Delhi in 1885–86, the Oudh and Rohilkund at the end of 1888, and the South Indian in 1890. In 1870 a new state of railway development began. The direct agency of the state was inaugurated; and in 1880–81 the system of encouraging private enterprise by state assistance was again adopted. Both agencies are now employed. In some instances— notably the Bengal and North-Western lines—these were constructed with the object of direct pecuniary assistance; in others a subsidy or limited guarantee has been granted. The agency of private companies has also been employed by the government both in the construction and working of state lines. In all cases the government has the power of over-riding the railways at specified periods on stated terms. In 1884 a select committee reported in favour of a more rapid extension of railways than had been taking place, and recommended the broad gauge— i.e. 5 feet 6 inches—except in tracts where the 3 ft 6 inches gauge was already in successful operation, and for local lines where the traffic could only be light. The first railway opened in India was that of the Great Indian Peninsula Company from Bombay to Tannah, traffic being commenced on 4th May 1853, and the close of 1865, 16,996 miles in working. Of this total 6077 miles were state lines worked by companies, 4680 miles state lines worked by the state, 2388 miles were worked by guaranteed companies, 381 by assisted companies, 520 miles were owned by native states and 124 private lines were owned by native states and worked by state railway agency, 547 were owned and worked by native states, and 582 miles were in Portuguese and French territory.

The first railway in Australasia was projected in 1850 in New South Wales, but was completed by the government. With a few small exceptions the railways of the Australasian colonies are owned and worked by the governments. The dates of opening of the first lines and latest mileage returns of each colony are: Victoria, 31st December 1835; New South Wales (29th May 1835), 2182 miles; Queensland (31st July 1865), 2113 miles; South Australia (10th April 1856), 1810 miles; Western Australia (21st January 1864), 569 miles; New Zealand (1st December 1855), 1965 miles; Tasmania (10th April 1872), 364 miles. In Australia, in 1870 there were but 948 miles of railway, but in 1890 there were about 12,000 miles. The distribution of this total is shown above. It is unfortunate that in Australia different gauges have been adopted, so that the systems join in inconvenient and expensive goods and passenger traffic.

The Victorian lines are built on the 5 feet 3 inches gauge, which is also the national standard in South Australia, but this colony has also 700 miles on the 3 feet 6 inches gauge. In New South Wales a 4 feet 8½ inches gauge is the standard, but there is also a 5 feet 3 inches line. In Queensland, Western Australia, Tasmania, and New Zealand all the railways are on a 3 feet 6 inches gauge. The capital cost per mile of the Australasian lines has been: Victoria, £13,612; New South Wales, £12,532; Tasmanian, £8436; New Zealand, £7582; Queensland, £6766; South Australia, £6444; and Western Australia, £4374 per mile. In Cape Colony the first railway was opened on 6th June 1860 and when the government took over the railways in 1873 there were only 63½ miles; in 1890 there were 1890 miles. In China the first short railway at Woosung was torn up after a few months' working, but the line to the Kaping coaleries was not disturbed. Some 100 miles of the Ten-tsin line has since been constructed, and plans are under discussion for the construction of a trunk route. See the articles on the several countries.

Railway Mileage.—The dates of the opening of the first railways, and the mileage in 1801, of the principal countries are as under:

Rain. Whatever lowers the temperature of the air below the point of saturation, or the dew-point, leaves the air as a rain. Various causes may conspire to bring about this change of temperature, but by far the most important of these originate in winds and other movements of the atmosphere. The more prominent principles of the connection of the winds to the rainfall are these: the rapid ascent of the air, but also to great extent of ocean before reaching land the rainfall is large; (2) when the winds, on arriving at the land, advance into higher latitudes or into colder regions the rainfall is largely increased, for the simple reason that the air is now more rapidly brought below the point of saturation; (3) if the winds, even though they have traversed a great extent of ocean, yet on arriving at the land at once advance into lower latitudes or into warmer regions, the rainfall is small; (5) if a range of mountains lie across the onward course of the winds, the rainfall is largely increased on the side facing the mountains, but reduced on the other side of the range: the reason being that, as the air on the windward side of the ridge is suddenly raised to a greater height in crossing the ridge, the temperature is still more reduced by further ascent, and a more copious precipitation is produced. On the lee side, as the air descends to lower levels, it gradually gets drier, and hence the rainfall of necessity diminishes with every stage of the descent to lower levels.

Attention may be here drawn to the diminished vertical extent of land over land and over the sea, as has been fully shown by the observations of the Challenger expedition. From these it has been proved that an envelope of stiller air, or air of less velocity as compared with that of the ocean, broods over the land, and by its presence forces the wind blowing across the land to a greater height, thus augmenting the rainfall. This dragging effect of the land on the wind, and the important consequences resulting from it, explain how it is that during north-easterly storms of rain the shores of the Firth of Forth, Moray Firth, and the east coast of the island, which look like islands, receive a much heavier rainfall than other parts of Scotland in those circumstances. On the Ayrshire coast the annual rainfall at Ayr is 38 inches, but at Girvan it rises to 51 inches. Both stations are close to the coast, the only difference being that the hills to the eastward approach much nearer the coast at Girvan.

For short periods the heaviest rainfall occurs with thunderstorms, and with tornadoes, water-spouts, and other forms of the whirlwind, for the reason that not only is their rapid ascent due to the presence of the winds, but also to the great rarefaction produced by the extreme velocity of the gyration of the air round the axis of the whirlwind. One of the heaviest rainfalls yet recorded in the British Islands was 2-24 inches in 40 minutes at Lednarthe, Forfarshire, during a severe thunderstorm on 8 August 1887. At Camberwell, 3-12 inches fell in 2 hours 17 minutes on 1st August 1846. Of heavy falls during one day the following may be mentioned: Den Nevis Observatory, 7-29 inches, 30 October 1890; Seathwaite, 6-78 inches, 30 August 1854; Tornoe Island, 6-6 inches, 7th September 1870; Newbigging, Wales, 5-33 inches, 14th July 1875; and Cambrinus, Argyllshire, 5-60 inches, 24th January 1868.

In the United States, where severe thunderstorms and tornadoes occur more frequently than elsewhere, the daily rainfalls repeatedly exceed these amounts. Thus, the rainfall of 24th July 1884 at Mount Darby, Texas, was 12-94 inches in 24 hours; 10-70 inches, June 1887; Key West, 7-80 inches, September 1889; Charlotte, 7-61 inches, March 1889; Shreveport, 7-4 inches, January 1885; and a day’s rainfall of from 5 to 7 inches is generally recorded in the United States. These amounts are greatly exceeded in lower latitudes. Thus, on the Kluco Hills, India, 30 inches on each of five successive days have been recorded; at Bombay, 24 inches in one night; and at Gibraltar, 33 inches in 26 hours.

As regards the ocean little is yet known from observation. This, however, is clear, that in the equatorial belt of calms between the regions swept by the two trades the rainfall of the ocean reaches the maximum; and the parts of the Atlantic and Pacific which are longest within the belt of calms as it shifts northward and southward with season have the heaviest ocean rainfall. But, though the cloud-screen is unquestionably dense and the rainfall frequent and heavy, the observations of the Challenger and the Novara show that the statements made as for the climate are exaggerated. Over the open sea in the regions of the trades the rainfall is everywhere small, owing to the circumstance that these winds are an immediate outfall from anti-cycloonic regions, their dryness being further increased since their course is directed in regions that become constantly warmer.

The trades, however, deposit a larger rainfall over islands and other land-surfaces which they traverse; the amounts being proportional to the height of the land, but more particularly to the degree in which the high land ranges lie across the paths of the winds. Thus, at Ascension, which is within the south-east trades the whole year round, the annual rainfall is 8-85 inches; and at St Helena on the coast 5-36 inches, but on the high land in the interior of the island it rises to 24 inches. In the western division of the Pacific, for some distance on each side of the equator, the rainfall is very slight, and extensive guano deposits are formed on Malden and other islands scattered over that region. In Maritius, on the western shore of the island, the annual rainfall is about 2,000 inches; but on the north-east, it is 146 inches, the latter place being in the neighbourhood of extensive forest-land mountains.

The heaviest rainfalls of the globe are brought by the winds which have traversed the greatest extent of ocean within the tropics. These conditions are most completely fulfilled from June to September by the winds which, beginning their course from about 30° S. lat., blow home on southern Asia as the south-west monsoon, which accordingly distributes a heavier rainfall over a larger portion of the earth’s surface than occurs anywhere else in any season. On these summer winds the rainfall of India chiefly depends, and the ‘lie’ of the mountain-systems with respect to the winds intensifies the effects. The following in inches are the annual amounts at different points in the island of Surat southward: Surat, 41; Bombay, 74; Mulk, Lahore, 80; Honawar, 139; Calicut and Cochin, 115. In the west of Ceylon the rainfall is also large, being at Colombo 88, at Galle 90, at Ratnapura, inland among the hills, 150; but in the east of the island, before it reaches the sea, it is reduced to much of its moisture; it is considerably less, being at Mannar 91, at Jaffain 49, and at Trincomalee 62. The rainfall is also very large in Burma, being at Akyab 194, Sandoway 214, Diamond Island 119,
RAIN

Rangoon 99, Tavoy 197, Mergui 162, and Port Blair 117. In the north-east angle of the Bay of Bengal, and thence north to Bluntan, where the summer monsoon curves to a westerly course up the valley of the Ganges, the rainfall is great, rising at Cherra-punjii, in the Khosi Hills district, to 472 inches—or nearly 40 feet—being the largest known rainfall anywhere on the globe. Owing to this diversion in the course of the monsoon, the valley of the Ganges enjoys a generous rainfall. One of the most remarkable falls on record is small over the plains of the Punjab, at Multan 6'79, and at Kurachee 7'25, increasing over the higher parts of the province, at Lahore 21, Umballa 36, Sinoa 70, and Dharmasala 122.

The key to the distribution of the rainfall over the East Indian Archipelago and Australia is the distribution of pressure from south-eastern Asia to Australia, with the resulting prevailing winds. During the winter months pressure diminishes rapidly from Asia southwards, and northerly winds prevail. Now, as these winds have travelled in the great breadth of ocean, they arrive in a highly saturated state and deposit a heavy rainfall over these islands and the north of Australia. The degree to which these rains penetrate into Aus-

tralia depends entirely on the strength of the winds, and also on the position of the anticyclone forming the summer months pressure increases from Asia southwards, and southerly winds set in from Australia to Asia, distributing in their course a very large rainfall over the islands of the Eastern Archi-

pelago, rising at every island in the month. The small rainfall in such islands as Timor, which are more immediately sheltered, as it were, by Australia during these southerly winds, impresses on the region well-marked dry and wet annual seasons. These marked differences are due to the fact that these islands of the East Indian Archipelago really depend on the geographical distribution of land and sea in this part of the globe, and must there-

fore be regarded as permanent differences, and as having played no inconspicuous part in the unique distribution of animal and vegetable life which is so characteristic of the East Indian Archipelago. The summer of the southern hemisphere the winds blow from the sea inland, and in the winter from the land seaward, it follows that generally the summer is the rainiest season. In the interior, along the Murray River and the Murray River, the rainfall is very small. As in Oregon in the interior of the United States.

As regards the rainfall of the two extreme

months, January and July, the following show in inches the amounts for various places: Vera Cruz, 5'10 and 35'0; Pera, 0'65 and 3'26; Manaoas, 7'33 and 1'82; Buenos Ayres, 2'37 and 1'70; Corrientes, 5'24 and 2'97; and in Africa, Alexandria, 1'43 and 0'20; Algiers, 4'43 and 0'04; Senegal, 0'28 and 3'00; Sierra Leone, 0'69 and 24'20; Cape town, 0'28 and 3'83; Durban, 5'00 and 1'70; and Zanzi-

bar, 2'92 and 2'33. The explanation of these and similar differences in terms of the changes of the wind. The South African colonies present the

strongest aspects of climate, so far as the rain-

fall is concerned, being divided into two totally distinct classes, the climates of the Natal coast and of the inland regions where the rains occur during the summer months, and the climates of the other regions where the rains fall chiefly during the winter months. The driest region of Africa is doubtless the Sahara, and the wettest the region from the Victoria Nyanza northwards, including the gathering-grounds of the Nile.

See METEOROLOGY. Also BLOOM, RAIN, and, for showers of frogs and fishes, SHOWERS. For maps of annual rainfall of the globe, see Lewin in Silliman's Amer. Jour. Sci., Murray in Jour. Roy. Scot. Geo. Soc., and Huxley in Climatological Atlas. For particular coun-

tries, Synms, and Buchanan for the British Islands; Raulin for France and Algiers; Blanshard and Elliot for India; the Dutch for East India Islands; Tod, Russell, Hector Ellery, and the British Embassy for China; the Service for the United States; Carinael for Dominion of Canada; the Meteorological Services of the different European countries, &c.

Rainbow. The rainbow is the best known of all optical meteorological phenomena, consisting of a coloured arch formed opposite the sun on falling raindrops, and visible whenever the necessary conditions of a passing shower on one side and a clear and not too high sun on the west of Norway it is 72 inches at Bergen, 46 inches at the Lofoden Isles, and 10 inches at the North Cape; over large portions of Sweden it is 21 inches, and in Russia and Siberia it varies from 20 to 2 inches. Spain presents great advances in the rainfall. In the north-west to 13 inches at Saragossa. In the plains of France and Germany it varies from 20 to 35 inches, rising, however, on approaching the Alps to more than 100 inches. In western Europe the rains are greater generally the rain falls in winter, but in the interior of the United States, and the summer climates of the extreme south of Europe and in the north of Africa, situated at comparatively low levels, are practically rainless, owing to the northerly winds that set in with considerable force at this time of the year towards the heated plains of the Sahara.

The summer winds in the south-east of the United States are southerly and, as they have previously traversed a considerable extent of ocean, they arrive well but not super-saturated, and pour down a monthly rainfall of 6 inches or more from Louisiana to Chesapeake Bay. The comparative equableness of the rainfall over the eastern states is the result of no mountain-ridges lying athwart their path and of the winds passing into higher latitudes and therefore cooler regions. Again, the summer rainfall in the United States and Canada is either nothing or very small; whereas on the east side winds are southerly, and the rainfall consequently equals, or even exceeds, that of the finest agricultural region on the Continent of Great Britain.

Rain, or wet weather, is often regarded as the finest of all blessings, and even by the ancient Greeks, as they have been by many since their time, as a keynote in the domestic life of the household. To the ancient poetical mind it had the same charm and beauty as the rainbow. The ancient Greeks attributed to them the power of giving rain, and the rainbow was regarded as the token of the gift; and therefore it is not strange that when the ancients expressed the wish that the god of rain would send rain, they said, 'May the rainbow appear.'
RAINBOW

other occur. Two bows are frequently seen, each exhibiting the full spectrum of colours from red to violet; but in the inner or primary bow the red is the outer edge and violet the inner, while in the outer or secondary bow the order is reversed, the red being inside and the violet on the exterior. The colours are always arranged in a definite order, that of the solar spectrum—viz. red, orange, yellow, green, blue, indigo, and violet, but shade imperceptibly into each other. The cause of this breaking up of the sunlight into its constituent colours is explained in most physical and meteorological text-books (see Light, by Professor Tait, chap. x., or Meteorology, by E. Loomis, par. 410), but may be briefly summarised as follows:

For the primary bow (fig. 1), let PQR represent the section of a raindrop, and SP a ray of light falling on it. The ray enters the drop at P, meets the surface again at R, is reflected to Q, where it leaves the drop in the direction EQ. The ray is refracted or bent on entering the drop at P and again on emerging at Q—the amount of this refraction depending on the acuteness of the angle at which the ray meets the surface. Now it may be shown that there is a particular point P, such that any ray from S striking the surface below P emerges again above Q, and any ray above P also emerges above Q—the former owing to the more acute angle of the reflection, and the latter to the greater refraction on entering and leaving the drop. The course of two such rays is shown by the dotted lines in fig. 1. Q is thus a turning-point in the emerging rays, and near it a very large number of rays pass out, and an observer at E sees a bright image of S in the direction EQ. This statement applies to any one colour of sunlight; but, as the refrangibility increases from red to violet, the latter is bent more at P and Q, and the line EQ lies at a flatter angle. The observer, therefore, sees the violet rays reflected on drops at a less altitude than those that reflect the red, the other colours being intermediate. The raindrop being spherical, this reflection takes place in all directions, the fixed condition being the radius of the bow, that is the angle between the line from the observer to the bow and that passing from the sun to the observer, or, in other words, the observer's shadow. For red light this angle is 42° 59', and for violet 40° 13'. If the sun were a luminous point each colour would be sharply defined, but at the disc of the sun subtends an angle of about 30°; each colour is broadened to this amount, and they overlap.

Exactly similar reasoning explains the secondary bow (fig. 2). The light that forms it has been twice reflected, at R and at R', the point Q lies above P, and rays entering either above or below P all emerge below Q. A glance at the diagram will show that the greater bending of the more refrangible rays makes the line EQ more nearly vertical, and therefore the violet rays form the outer edge and the red the inner of the secondary bow. The radius of the red is 50° 5', and of the violet 54° 0'. The space between the bows gets no reflected light, but that inside the primary and outside the secondary is faintly illuminated by rays such as are indicated by the dotted lines in fig. 2 and their equivalents in fig. 2, which are not shown. These rays 'interfere' (see INTERFERENCE) with each other, and cause alternations of colour which appear as spurious bows inside the primary and outside the secondary. They can only be seen with strong sunlight and small drops of rain.

The radius of the primary bow being roughly 40°, it is evident that it cannot be seen when the sun is at a greater elevation than this, as the highest part of the bow would lie below the horizon. Hence in the latitude of Edinburgh rainbows cannot be seen for several hours both before noon and after the middle of the afternoon, the sun's altitude being then only sufficient for the formation of the primary bow, and the rainbows, all dependent on the fact that they can only be seen with strong sunlight and small drops of rain. Intersecting rainbows have frequently been seen.

When the sun is reflected from a surface of still water a bow is formed by the reflected image as well as by the sun itself. Lunar rainbows often occur, but the feebleness of the moon's light usually prevents any colours being observed. There are many popular weather-prognostications connected with rainbows, all dependent on the fact that they imply local passing showers. 'A rainbow in the morning is the shepherd's warning; a rainbow at night is the shepherd's delight,' is easily understood when we remember that the rainbow is formed opposite the sun, and that weather-changes in the British Islands generally pass from west to east.

Rainey's Corpuscles. See GREGARINA.

Rain-gauge. Rain-gauges measure the quantity of rain which falls, and are of various constructions. One of the best is that known as Symons' rain-gauge, consisting of a funnel-shaped receiving vessel, and a glass measure of much smaller diameter so as to allow as nice graduation as may be desired. In the fig. a is the funnel-shaped receiving vessel (shown in section in the fig.), 5 inches in diameter, with an upright, sharp-edged and strong rim, in order that it may retain its circularity; b, the vessel which receives the rain collected; and c, the graduated glass measure which measures the amount in tenths and hundredths of an inch. If desired it may be graduated to still greater nicety. Another excellent gauge is one which is a modification of Glaislier's gauge, brought into use by the Meteorological Office. The diameter of this gauge is 8 inches, and there is added to it a vertical cylinder on the top of the
RAJMAHAL

RAIJER

receiving funnel, to retain the snow as it falls and prevent its being blown out of the gauge, as is likely to happen when the funnel is shallow. Beckley's is perhaps the best continuously recording rain-gauge, and is now very generally superseding Oster's so long in use.

Since different amounts are collected at different heights above the ground it is indispensable, if uniformity and comparability is to be attained, that the rims of rain-gauge be cut at one uniform height above the ground. The height now generally adopted is 12 inches. The points it is necessary to secure at the height adopted are:

1. The prevention of in-splashing, which occurs when the funnel is very shallow; and
2. The protection of the gauge as much as possible from strong winds, which so seriously interfere with the amount collected, by placing it near the ground as can be done consistent with the prevention of in-splashing. These conditions are best fulfilled by using the gauges named, and placing their rims 12 inches above the ground. It has been proved from carefully conducted experiments that rain-gauges with diameters varying from 3 inches upwards collect amounts, when in positions exactly similar, within about 3 per cent. of each other. Accordingly, gauges with diameters exceeding 8 inches insure no greater accuracy than smaller ones, being only really required in the case of continuously recording gauges to hold the self-regulating apparatus.

On the other hand, gauges of from 3 to 5 inches diameter, such as Fleming's and Jagga's, give good trustworthy results.

Special care should be taken that the gauge and its glass measure be kept clean; that it be firmly fixed and the rim kept in a horizontal position and that it be made of a material which will stand exposure to the weather well. It should be placed in a situation as open as can be secured for it, particularly towards the directions from which the rain chiefly comes; and in each case it should be as distant from any neighbouring house, tree, or other object at least as far as the height of the object itself.

Rainier, Mount, or Tacoma, one of the highest peaks of the Cascade Range (q. v.), was in eruption during part of 1804.

Rainy Lake, forming a portion of the boundary line between Ontario and the United States, lies west, and 100 miles distant from the nearest point, of Lake Superior, and is about 50 miles long. It discharges by Rainy River into Lake of the Woods. There were gold finds on the Canadian side in 1896-97.

Raipur, a town in the Central Provinces of India, standing on a plateau (950 feet), 180 miles E. of Nagpur, has numerous tanks and groves, an old fort (1640), and a trade in grain, lac, cotton, &c. Pop. 23,759.

RAISED BEACHES. See BEACHES (RAISED), UPHEAVAL.

Raisins are dried grapes, used for cooking, for dessert, and in the manufacture of wines. They are produced in largest quantities in the southeastern provinces of Spain—Malaga, Alicante, and Valencia—and in Asia Minor—the islands of Cos and Samos—and the adjacent districts on the mainland; smaller quantities are grown in Southern Italy, the islands of the Greek Archipelago, and Crete. Currants (q. v.) are a small and peculiar variety produced in Greece, in the Morea, and the Ionian Islands. The grapes intended for raisins are dried either on the vines, after the stalks of the bunches have been partly cut through, or spread out on the ground; it is only in case of continued bad weather or persistent want of sunshine that they are dried by artificial heat. The better qualities are left on the stalks and dried in bunches; these are exported for use as a dessert. All less estimable qualities are intended for cooking purposes, and, to a less extent, for the preparation of artificial wines or the improvement of wines of inferior quality. Raisins are rich in sugar, and it is this property that makes them serviceable to the manufacturers of wines. They are used for table use and sometimes dipped in water upon the surface of which swins a layer of olive-oil, or in a strong potash lye. The object is to make the skin soft and give it a glossy lustre. The raisins grown in Spain are large and bine, and are known in the market as 'Malaga raisins' and as 'lexias,' the former for dessert, the latter for cooking. The raisins of Asia Minor are shipped principally at Smyrna (q. v.), and embrace the Eleme and similar varieties, which are long and light brown in colour, and sultanas, small light-brown grapes, with a thin and downy skin, and no seeds or kernels. British imports in all annually from 493,600 cwt. (1886) to 633,100 cwt. (1887), valued at £813,900 (1886) to £1,022,400. From Spain Britain imports every year raisins to the average value (ten years ending 1889) of £506,370, and from Asia Minor to the value of £399,300 (1889). Of late years raisins have been successfully dried in California; but in 1890 the United States still imported raisins to the amount of 36,914,380 lbs., of the value of $1,997,103.

Rajah, or more correctly RAJ (from the Sanskrit rajan, 'king,' cognate with the Lat. reg-, reger), originally a title which belonged to princes of Hindu race who, either as independent sovereigns, or as feudatories of the reigning monarch, governed districts in India. Now, however, the title has a much wider extension; it is used of independent sovereigns of subject or protected princes, of petty chiefs, of great landowners, and of some persons of eminence who are neither rulers nor landowners.

Rajamahendri, formerly often spelt Rajak-mandry, a town of India, in the presidency of Madras, stands on the left bank of the Godavari, 30 miles from its mouth. It has a museum, a provincial school, two gaols, and some Christian churches. From 1753 to 1758 it was held by the French. Pop. 24,565.

Rajmahal, a decayed town of India, stands on a steep eminence on the right bank of the Ganges, 170 miles N.W. of Calcutta, on the chief town of the Bengal and Bahar provinces, but is now deserted and ruined, being only noteworthy for the remains of its palaces, formerly belonging to Shah Shuja and Kusum Ali, and as a station in an important trade-route. It is mentioned in the records of the lands of Bengal as having been lessened in consequence of the Ganges often shifting its bed at this point. In the beginning of the 19th century it had 25,000 inhabitants, and now only about 4000.
RAJON

Rajon, Paul Adolphe, an etcher, was born at Dijon in 1842, and trained in Paris, partly at the School of Fine Arts. About 1865 he turned to etching, and gained immediate success with his first plate, 'Rembrandt at Work,' after Meissonier. Standing in the front rank of French etchers, he won several medals at the Salon exhibitions, and produced numerous beautiful etched portraits and plates for books. In 1872 he visited England, and published in London in 1873 a portrait of J. S. Mill after Watts, as well as in subsequent years many other plates. His greatest achievements were 'The English Poets,' a picture by Alma Tadema, the portrait of Durand-Ruel, and that of Tennyson, Jonchim, and Mrs Anderson Rose by Watts. He died at Auvers-sur-Oise on 8th June 1888. See Twelve Etchings by P. A. Rajon, with Memoir by F. G. Stephens (1889).

Rajputana, an administrative territory of India, embracing twenty native states and the British district. (2711 sq. m.; pop. 460,722) of Ajmer-Morwar. It lies between Sind (on the W.), the Punjab (on the N.), the North-western Provinces (on the E.), and several native states of Central India (on the S.). Its total area is 132,461 sq. m., and its population is 5,398,000. The most important of the native states are Jaipur, Jodhpur (or Marwar), and Udaipur (or Mewar); next follow Uluwar (Alwar), Bharatpur, Kota, and Bikaner. This region is crossed by the Aravalli Mountains, and consists in great part of sandy, barren plains, though there are of course numerous fertile valleys and other tracts. It gets its name from the ruling race or predominant Aryan tribes, called Rajputs. They are a proud aristocracy, own the soil, and have furnished ruling dynasties to very many of the native states of India. Yet in 1851 they showed only 494 persons. At the time of the Mohammedan invasions in the 11th century the Rajputs ruled over half-a-dozen strong states—Kanauj, Ajmire, Anhilwar, Udaipur, and Jaipur. From the end of the 16th to the middle of the 18th century these states acknowledged the supremacy of the Mogul emperor of Delhi. Then they were made to recognise the Mahrattas as their masters: since the Mahrattas were crushed by the British the Rajput states are independent allies.

Rajshahi. See RAMCHAR BANGLA.

Rakoczy March, a simple but grand military air by an unknown composer, dating from the end of the 18th century (or see RANCO). It is said to have been the favourite march of Francis Rakoczy II. of Transylvania. The Hungarians adopted it as their national march, and in 1848 and 1849 it is alleged to have had the same inspiriting effect on the revolutionary troops of Hungary as the 'Marseillaise' had on the French. The air is generally known in Germany and elsewhere out of Hungary as the Rakoczy march is one by Berlioz in his Damnation de Faust; Liszt also wrote an orchestral version of the original.

Rakshas, See DEMONOLOGY.

RALEIGH

Raleigh, the capital of North Carolina, is near the Neuse River, 157 miles by rail SSW, of Richmond, Virginia. The town is situated on an elevated site, with a central Union Square, from which four principal streets radiate, each 90 feet wide. In the square stands the capital, a large domed building of granite, which cost over $500,000. It contains state institutions for the blind, deaf and dumb, and insane, and has iron-foundries, machine and car shops, and manufactories of clothing, carriages, and farming implements. Pop. (1890) 9205; (1900) 13,643.

Raleigh, Sir Walter, the typical gallant and hero of England's heroic age, was born of an ancient but decayed family at the manor-house of Hayes, near Budleigh in East Devonshire, in 1552. He was the second son of his father's third wife, who herself had been married before, and had borne her husband the famous Humphrey and Adrian Gilbert. He entered Oriel College, Oxford, in 1566, but left without a degree, most probably in 1569, to volunteer into the Huguenot cause in France. He was knighted at Tours in 1568, and on his return to England, was made secretary of state, and then ambassador to France. In 1570 he married Dorothy Walsingham, a daughter of Thomas Walsingham, Lord Treasurer of England. Almost immediately after his return he became prime favourite of the queen, whose heart was still susceptible despite the weight of almost fifty years. Fuller's well-known story of how he first caught her eye by flinging his cloak over the mire is more likely completely apocryphal, but well befits the romantic temper of the times and the manner of fantastic devotion with which the Virgin Queen loved to be adored, as it is said by the fine gentlewoman of her court. Raleigh was well equipped to serve the court: his looks and deportment, his skill in horsemanship, his wit, his readiness to save the queen's foibles, his great knowledge of the world, his wit, his sense of beauty; his tall and handsome figure, dark hair, high colour, lofty forehead, resolute and manly bearing, alert expression, and spirited wit combined to form an imposing personality, and all the advantage that nature had given him he heightened by a gorgeous splendour in dress and in jewels. But he was proud, haughty, and impatient, and everywhere, save in his native Devonshire, the broad accent of which he preserved all his life, he made himself a multitude of jealous and envious enemies. He was more confident in his Irish affairs, but never to the last took a public place in the queen's counsels, perhaps because his royal mistress, with all her fondness, distrusted his ambition, and divined that he lacked that sagacity of the statesman which she recognised in the less splendid Burghley and Walsingham. The playful name of 'Water' by which she called him seems itself to imply a recognition of that instability of character which was his constant foible and, in the fullness of time, the occasion of his ruin. But meantime she heaped favours hitherto upon him: in April 1581 he received the 1st month the 'farm of wines,' a license duty of twenty shillings a year from every vintner in the kingdom, which at one time yielded £2000 a year; and in March 1584 a grant of license to export woolen broadcloths, which Burghley estimated had yielded him in a year a sum as much as £1000. After the close of 1584 he was knighted: in July 1585 he was appointed Lord Warden of the Stannaries, in September Lieutenant of Cornwall, in November Vice-admiral of Devonshire and Cornwall; and in the same year he was elected to parliament as one of the two representatives for Devonshire. In 1587 he succeeded Sir Christopher Hatton as Captain of the Queen's Guard. During the summer of 1584 he leased of the queen the statelier mansion of Durham House, spent much money on its repair, and kept it as his town-house from that time down
to 1603. It was not till about the beginning of 1592 that he came into possession, on a ninety-nine-years' lease, of the splendid park and castle of鹘bourn, where he spent his last years.

In 1583 Raleigh risked £2000 in Sir Humphrey Gilbert's last ill-fated expedition, and on the news of his half-brother's loss took up a fresh charter of discovery and colonisation. In April 1584 he sent out a party of Spaniards and wolfs to explore the coast north of Florida. They made a pros- perous voyage, and formally possessed a district of which Elizabeth was pleased to give the name Virginia. Next year Raleigh fitted out a stronger expedition under Ralph Lane and Sir Walter Raleigh, which the Queen allowed him to live a year under Lane's command on the island of Roanoke. Returned to England in Drake's fleet completely dispirited with their hardships. Soon after they set sail, Sir Richard Grenville arrived with three ships, and left on the island fifteen men well furnished with stores. One of the hundred colonists—the first citizens of America—Thomas Harriot, in his account of the colony and the causes of its failure, speaks of the herb, 'called by the inhabitants Yppoco,' which was destined to live more than half the life of the colonists, half the world. Raleigh himself took to the new luxury, and would enjoy it in pipes of silver, the queen sitting by him while he smoked. In May 1587 he sent out three ships, under Captain Charles White, with 150 colonists, seventeen of whom were women and several were pregnant. He offered to take ten stripes or one year's imprisonment for any who deserted. But Raleigh was to have his vengeance: one year later 42,000 Spaniards landed and killed him, and many misfortune after misfortune overtook themselves. "While returned to England for supplies, and at length, after many delays and difficulties, reached Virginia in August 1590 to find the settlement mined and the colonists dispersed, never to return. This was the direct attempt of Raleigh himself at the colonisation of Virginia. The undertaking, says Hakluyt, 'required a prince's purse to have it thoroughly followed out'—it is supposed that Raleigh himself had spent forty thousand pounds upon it."

Already in May 1587 the appearance of the handsome young Earl of Essex at court had endangered Raleigh's paramount place in the favour of the queen. Hatton and Leicester long ere now had shown their jealousy of him, but this impious and scandalous boor openly defied him, and at length drove him from the court to Ireland. He had already received in the spring of 1587 a grant of 42,000 acres in Munster, and with char-acteristic vigour he at once set about repeopling this tract with English settlers. He was in Ireland when the Invincible Armada appeared in English waters, but he hastened to the south of England to superintend the coast defence, and he was present with the fleet a trusted counsellor throughout that glorious week of toil and triumph. His vessels scoured the seas in privatreching enterprises, which gratified at once his inborn hate of Spain and helped to provide the means for his vast expense and his Virginian ventures. His overzealous seamen sometimes transgressed the forbidden limit of piracy, but the Treasury winked at such accidents of war, and Bacon lamented only the lack of the plunder. Raleigh sailed with Drake on his Portugal expedition of 1589, but by the autumn of that year was again in Ireland, where he quickly became a warm friend of Spenser, with the endless fame of whose great poem his name is imperishably linked. The point had set itself on his estate at Kilmanagh three years before, and here the 'Shepherd of the Ocean' [Raleigh] visited him, and read him his poem of The Ocean's Love to Cynthia [Elizabeth], which Mr Gosse thinks must have contained at least 10,000 lines, the extant 120 stanzas being a fragment. In Colin Clancy's Come Home Again we read how Raleigh carried the poet into the presence of the queen, who took delight to hear his poem, and commanded it to be published.

In this English garden of Spain Raleigh planted tobacco, as well as the first potatoes that grew on Irish soil. He quickly recovered all his influence at court, and busied himself with further schemes for reprisals on the Spaniards. Early in February he busied himself to prepare a new expedition to seize the Spanish treasure-ships, but again his doting mistress forbade him to sail with the fleet, which he had reluctantly procured to entrust to Frobisher and Sir John Borough. Hardly had he returned before he seems to have discovered his intrigue with Bessy Throckmorton, one of her own maids-of-honour—an infidelity to her own supremacy which her jealous temper could not brook. In July 1592 Raleigh was committed to the Tower, and it was not till six years before he had any interview with his mistress' presence. He bore his imprisonment with characteristic impatience, and vexed the air with exaggerated complaints of his loss expressed in the fantastic fashion of the time. Meantime Borough had captured the Madre de Dios, a huge Spanish galleon and the richest for Spain ever captured. It was shown to the queen in September. So great was the excitement and such the rapacity of the vultures that gathered to the spoil that none but Raleigh could control the tumult. He was sent down to Dartmouth with a keeper, and Sir Robert Cecil describes with astonishment how Raleigh and his sailors and their countrymen. 'But his heart is broken,' he writes his father, 'for he is extremely pensive longer than he is busied, in which he can toll terribly.' Raleigh now married Bessy Throck- morton, and for the next two years lived with her in quiet happiness, building and gardening at Sherborne. About 1593 his imagination seems first to have been fired by the descriptions of Guiana, with its vast city of Manoa and its El Dorado, and in 1594 he sent out Captain Whiddon to Trinidad, which island he visited and described. In 1595 he himself sailed with five ships, explored the coasts of Trinidad, sailed up the Orinoco, and up his imagination set aglow for life by the tropical splendours of vegetation that he saw, and still more by the auriferous quartz and glittering stones he found, and marvellous stories of stores of gold beyond brought to him by the native Indians. Six months after his return he sent Captain Lawrence Keymis to make further explorations, and later Captain Berry, but he himself failed to raise any great public interest in England in his splendid dream of a new world and untold wealth from the mines of Guiana. Early in 1596 he published The Discovery of the large, rich, and beautiful Empire of Guiana (Hakluyt Society, edited by Sir R. Schom- burgk, 1848), a splendid piece of vigorous prose. In June 1596 the queen visited him at Hatfield; at his request she gave him £2000 and in October Howard and Essex to Cadiz, and it was his advice that governed the whole plan of action in that splendid triumph which a second time deferred the naval strength of Spain. His faults over fell from him in the year of his release, and again in Spain he showed such tact and temper as in the skilful persuasions by which he forced the Lord Admiral and Essex to agree to his plans. But he was mortified to the heart, as he lay in his ship suffering from a wound in the leg, when their lack of energy allowed the Spaniards, two days later, to burn the whole fleet of treasure-laden
RALEIGH

earracks before his eyes. His spirited Relation of Cadiz Action remains the best history of the exploit. Despite his heroic conduct, it was almost the midsummer of 1597 before Raleigh was again admitted to court and allowed to take up his place as Captain of the Guard. Cecil showed himself friendly, and, as usual, the belief in his support was in his desire for a more active opposition to Spain, Raleigh at once set himself to prepare and volunteer ships for the projected expedition, which at length, in July 1597, was permitted by the queen to set sail from Plymouth. A desperate storm compelled abandonment of the project, and, without reducing his repudiation of it, Raleigh met Essex off the island of Flores. They agreed to attack together the Isle of Fayal, and Essex sailed off first, but Raleigh reached the harbour before him, and, after waiting three days, on the fourth landed his men and carried the town by storm. Next morning the squadron of Essex made the harbour, to find all the laurels of the 'Island Voyage' already reap'd. Essex's mortification was great, and was made greater by his cold reception at home. His surlily temper grew upon him, and soon his helpless failure in dealing with Tyron's rebellion and his ignominious arrest in the streets of London brought him to the block. His hatred of Raleigh had become so desperate that he charged him, together with Cecil and Cobham, with a plot to murder him in his house—an absurd accusation, which Sir Christopher Blount, as the king's attorney-general, was commissioned to put out to colour other matters. In 1600 Raleigh succeeded Sir Anthony Paulet as governor of Jersey, and in his three years' rule did much to foster its trade and relieve its fiscal burdens. About this time also he was active in parliament, advocating freedom of trade, and of church-goings, and forgetting the repeal of the more vexatious monopolies. His Irish estates he sold in 1602 to Richard Boyle.

In the dark intrigues about the succession that followed the closing years of Elizabeth's reign Raleigh took little part, while the crafty Cecil and the faithless Lord Henry Howard got the king's ear, and for their own advantage poisoned his mind against Raleigh and Cobham. The king had long been an admirer of Essex, and no doubt knew from the beginning that Raleigh was indifferent to his courtiers. The oaparly, timid love of peace, and the whole personality of the Duke of Buckingham, far as he was his overweening conceit of his own judgment in affairs of state, were all naturally repugnant to the bold, self-reliant hero who had so long been a trusted confidant of the great-hearted queen. He met James on his southward progress at Buxley in Lincolnshire, and was greeted with a withered pun worthy of its source—'On my soul, man, I have heard but nucky of thee.' Ere long he was stripped of, or forced into resigning, all his offices, the captaincy of the Guard, the warshipness of the Stanwixes, the wine-license monopoly, the governorship of Jersey. At this time he went to the heart, and as he was at no time guarded in his tongue it is possible enough he may have in his haste spoken, or at least listened to, words expressing a preference for Arabella Stuart to the rule of the queen. Such was the only witness against him, was the miserable Lord Cobham, and he made and unmade his eight several charges with such facility as to make them of no value at all. Neither in the 'Main' nor the 'Rye' Plot was there any really adequate evidence of Raleigh's complicity, and the referee, Lord Salisbury, to allow him to be hanged for what he accises is of itself almost enough to justify belief in his innocence. 'But one thing,' says Kingsley, 'comes brightly out of the infinite confusion and mystery of this dark Cobham plot, and that is Raleigh's innocence.' Raleigh was arrested on the 17th July, and in his first despair tried to kill himself. The trial began at Winchester on November 17th, the prosecution conducted by the attorney-general, Sir Edward Coke, who disapproved his role by a brutality almost beyond belief. Raleigh's defence was splendid, and for the first time in his life he made his way into the hearts of the people, but he was cast aside after his bearing and the burning eloquence of his words. Coke could call him 'a monster,' 'a viper,' 'the rankest traitor in all England,' 'dannable atheist,' and 'a spider of hell,' and Chief-justice Popham could jeer at him as an atheist as well as traitor; but he was too great to be any further condemned. In the hero of Cadiz and of Fayal had 'a Spanish heart,' and all his unpopularity fell from him from that hour. Dudley Carleton, who heard the trial, wrote that when it began he would have gone a hundred miles to see Raleigh hanged, but ere it was closed he would have gone a thousand to save his life. Yet he was condemned to death, and only on the scaffold was his sentence commuted to perpetual imprisonment. Sherborne he had conveyed to trustees for his wife and eldest son, but an invalidity in the deed of conveyance was soon found, and the unhappy Earl of Essex was condemned. And when the king was met with the words, 'I mean has the land, I mean has it for Carr.' In January 1609 it was given to the favourite, a payment of £8000 being made as compensation. Within the Tower Raleigh employed himself with study and with chemical experiments, and was treated on the whole in a manner which has never been surpassed. When Henry came often to him, he greatly admired the noble captive: 'No man but my father would keep such a bird in a cage,' said he. But he died in November 1612, and the promise he had wrung from his father to release Raleigh the next Christmas was only remembered to forget it, with the history of Raleigh's imprisonment was his History of the World, the first and only volume of which, extending to over 1300folio pages, although coming down but to the second Roman war with Macedonia (170 B.C.), was published in 1614. It is written throughout in admirable English; but the preface is the most interesting portion, for the subject itself is dainty, though lightened by glimpses of autobiographical and occasional flashes of fire-screeching satire wrapped in ambiguous phrase. Its sale was suppressed in January 1615 as 'too saucy in censure of the present state of the empire.' To the reader writing to his son Richard, in 1650, says, 'Recreate yourself with Sir Walter Raleigh's History; it is a body of history, and will add much more to your understanding than fragments of story. The book was written for the young prince, and his death took from the author all heart to complete his work. Other writings of Raleigh's captivity were The Prerogative of Parliament (written 1615, published in 1628), which must have gored the king still further; The Cabinet Council, published by John Milton in 1628; A Discourse of War, one of his most personal, in 1624; Writing; and Observations on Trade and Commerce, an appeal for free trade, suppressed like the rest.

On January 30, 1616, Raleigh was released from the Tower through the influence of Sir Ralph Winwood and Willinges, expressly the crown's preparations for an expedition to search of a gold-mine which he maintained existed there. He engaged not to molest the dominions of the king of Spain, but he had been brought up on the old Elizabethan theory of no peace beyond the sea, and rested his faith on nothing short of gaining to gain and nothing to lose by a desperate venture, and that the gold he would bring home would gild over any formal breach of his promise. It seems difficult to understand how James can have expected that such an expedition could be made without a collision with Spain, and we find that he
RALEIGH 571

was careful to give himself the cowardly safeguard of allowing Raleigh to go with his old sentence still hanging over his head, as well as communicating his route to Guzman, the Spanish ambassador. And so in April 1618, the fleet was manned, some forty gentlemen excepted, by 'the very seem of the world, drunkards, blasphemers.' Storms, desertion, disease, and death followed them from the first, and ere they reached the mouth of the river Raleigh was himself stricken down by sickness, and compelled to stay behind with the ships, and entrust the command of the party who went to seek the mine to Keymis. He did not give his men distinct orders to avoid fighting with the Spaniards, and when they found in their way a new Spanish town, San Thome, they attacked it and burned it down but never reached the mine. In the fight young Walter Raleigh was struck down, as he shouted the words, 'Come on, my men! This is the only mine you will ever find.' Keymis lost control of his men, and came sadly back to his admirals, where no day passes without a knife cut into his heart. The men now refused to return with Raleigh to the mine, whereupon he asked them if they would follow him in an attack on the Mexican fleet, telling them in his desperation that he had his possession of the mine from France. At length, on the 21st of June 1618, he arrived at Plymouth with his ship, the Destiny, alone and utterly east down. His kinsman Sir Lewis [Julius] Stukely was sent to bring him up to London; at Salisbury on the way he feigned illness 'to forward his touch of Apology for the Voyage to Guiana. Surrounded by a ring of spies, chiefest among whom was Stukely, he again intrigued for an escape to France, but was betrayed at every step. James dared not allow him to appear before the council of state, but had formally examined before a commission of six, among them Coke, Archbishop Abbot, and Bacon, besides resorting to the infancy of sending a spy to gain his confidence and discover his secrets. In his perplexity Raleigh damaged his cause by confiding in friends and enemies, and his judges seem to have convinced themselves that he had never had any intention to find the mine at all, as appears from the Declaration of the Demeanour and Carriage of Sir Walter Raleigh, a feeble statement, though drawn up by the master-hand of Bacon. He was condemned to die the next morning (29th October 1618) on the old sentence, and neither the entreaties of the queen nor his own moving eloquence could save his life. 'You will come to-morrow morning,' he said to an old friend he met on his way back to prison; 'I do not know what to say for my life. To the part, I am sure of one.' One of his kinsmen warning him that his enemies would take exception at his high spirits, 'It is my last mirth in this world,' said he; 'I do not grudge it to me. When I come to the sad parting, you shall see me grave enough. His high courage never left him to the last. He wrote some verses the night before, and, says Dean Tousson, 'he ate his breakfast heartily, and took tobacco, and made no more of his death than if he had been to take a journey.' Of the cup of sack brought to the cell, says his secretary, 'If a man might stay by it.' The speech he made on the scaffold was masterly in its persuasive eloquence—"as he stood there in the cold morning air," says Mr Gosse, 'he falled James and Philip at one thrust, and conquered the esteem of all pesterly He asked to see the axe, and touched the edge with the words, 'This gives me no fear. It is a sharp and fair medicine to cure me of all my diseases.' To some one who objected that he ought not to lay his hands on the death which fate was weariing for him, while James even then was drawing into ever closer relations with Spain, and beginning his negotiations for the Spanish marriage. Before sailing Raleigh asked leave of the officers, in vain, to make an attack on Genoa, an ally of Spain. His vessel was manned, some forty gentlemen excepted, by 'the very seem of the world, drunkards, blasphemers.' Storms, desertion, disease, and death followed them from the first, and ere they reached the mouth of the river Raleigh was himself stricken down by sickness, and compelled to stay behind with the ships, and entrust the command of the party who went to seek the mine to Keymis. He did not give his men distinct orders to avoid fighting with the Spaniards, and when they found in their way a new Spanish town, San Thome, they attacked it and burned it down but never reached the mine. In the fight young Walter Raleigh was struck down, as he shouted the words, 'Come on, my men! This is the only mine you will ever find.' Keymis lost control of his men, and came sadly back to his admirals, where no day passes without a knife cut into his heart. The men now refused to return with Raleigh to the mine, whereupon he asked them if they would follow him in an attack on the Mexican fleet, telling them in his desperation that he had his possession of the mine from France. At length, on the 21st of June 1618, he arrived at Plymouth with his ship, the Destiny, alone and utterly east down. His kinsman Sir Lewis [Julius] Stukely was sent to bring him up to London; at Salisbury on the way he feigned illness 'to forward his touch of Apology for the Voyage to Guiana. Surrounded by a ring of spies, chiefest among whom was Stukely, he again intrigued for an escape to France, but was betrayed at every step. James dared not allow him to appear before the council of state, but had formally examined before a commission of six, among them Coke, Archbishop Abbot, and Bacon, besides resorting to the infancy of sending a spy to gain his confidence and discover his secrets. In his perplexity Raleigh damaged his cause by confiding in friends and enemies, and his judges seem to have convinced themselves that he had never had any intention to find the mine at all, as appears from the Declaration of the Demeanour and Carriage of Sir Walter Raleigh, a feeble statement, though drawn up by the master-hand of Bacon. He was condemned to die the next morning (29th October 1618) on the old sentence, and neither the entreaties of the queen nor his own moving eloquence could save his life. Rambois, the ninth month in the Mohammedan year. In it Mohammed received his first revelation, the veil of his piety was enkindled, and he is enjoined to keep a strict fast throughout its entire course from the dawn—when a white thread can be distinguished from a black thread—to sunset. Eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments, even swallowing one's spit, are strictly prohibited during that period.

Even when obliged to take medicine the Moslem must make some kind of amends for it, such as spending a certain sum of money upon the poor. During the night, however, the most necessary wants may be satisfied—a permission which, practically, is interpreted by a profuse indulgence in all sorts of enjoyments. The fast of Ramadam, now much less observed than in former times, is sometimes a very severe affliction upon the orthodox, particularly when the month—the year being lunar—happens to fall in the long and hot days of May or June. Skilful doctors, therefore, at the time of war are temporarily released from this duty, but they have to fast an equal number of days at a subsequent period when this impediment is removed. Nurses, pregnant women, and those to whom it might prove really injurious are expressly excepted.

The principal passages treating of the fast of Ramadam are found in the second Surah of the Koran, called 'The Cow.'

Rámâyana is the name of one of the two great epic poems of ancient India (for the other, see the article Mahābhārata). Its subject-matter is the history of Rāma (q.v.), and its reputed author is Valmiki, who is said to have taught his poem personally to Kings of Rajput land that the story of this latter account is open to doubt, it seems certain that Valmiki was a real personage, and, moreover, that the Ramayana was the work of one single poet—not, like the Mahābhārata, the creation of various epochs and different minds.

As a poetical composition the Ramayana is therefore far superior to the Mahābhārata; and it may be called the best great poem of ancient India. Whereas the character of the Mahābhārata is cyclopedic, its main subject-matter overgrown by episodes of the most diversified nature, the Ramayana has been the object in the history of Indian Ram. Its episodes are rare, and restricted to the early portion of the work, and its poetical diction betrays throughout the same finish and the same poetical genius. Whether we apply as a test the aspect of the religious life, or the geographical and other knowledge displayed in the two works, the Rāmāyana appears the older. Since it is the chief source whence our information of the Rāma incarnation of Vishnu is derived, its contents may be gathered from the article Vishnu. The Rāmāyana contains professedly 24,000 epic verses, or Slokas, in seven books—some 1,000 verses of six-syllable measure. The text which has come down to us exhibits, in different sets of manuscripts, such considerable discrepancies that there are practically two recensions. The one is more concise in its description, has a clinging tendency than the other to that kind of descriptive enlargement of facts and sentiments which characterises the later poetry of India; it often also exhibits grammatical forms and peculiarities of an archaic stamp, where the other studiously avoids that which must have appeared an affectation in the light of a grammatical difficulty. There can be little doubt that the former is the older and more genuine text.

A complete edition of the older text, with two commentaries, was published at Madras in 1850, at Calcutta in 1860, and at Bombay in 1861. Of the later version Gorresio edited the first six books without a commentary, but with the translation, and addition (a translation of the two last books) of R. T. H. Griffin, appeared in 1870-75 in five large volumes. See Williams, Indian Epic Poetry (1863); and Weber, Uber das Rāmāyana (1870).

Rambouillet. CATHERINE DE VIVONNE, MARQUISE DE, one of the most illustrious and illustrious women of the 17th century, was born at Rome in 1588. Her father was Jean de Vivonne, afterwards Marquis de Rambouillet, whose mother, Julia Savelli, belonged to an old Italian family. Through her mother was connected with the Flor- centine banking house of Strozzi. At twelve Catherine was married to Charles d'Angennes, son of the Marquis de Rambouillet, who succeeded to the family estates and title on the death of his father in 1611. From the very beginning she disliked alike the morals and manners of the French court, and she early determined to gather round herself a select circle of friends. At once virtuous, spiritu- telle, sympathetic, and appreciative, she gathered together a circle of literary friends, and through long series of years all the talent and wit of France, and in her salon met for the first time on an equal footing the aristocracies of rank and of spirit. For fifty years she received the wits, critics, scholars, and poets of Paris: Malherbe, Racan, Nozze, Racine, La Fontaine, Fourier, Strozzi, Scarron, Saint-Evremond, Renesmera, La Rochefoucauld. But half of the glory of the Hôtel belonged to the brilliant women who frequented it, among them Madeleine de Scudéry, the beautiful Duchesse de Chevreuse, the Marquise de Sable, who inspired the Marquise de La Rochefoucauld, Madeleine de la Vergne, afterwards Madame de La Fayette, the inimitable Madame de Sévigné; but conspicuous beyond all by her splendid beauty and faultless grace, the idol of both sexes, shone the sister of the great Condé, and the heroine of the Fronde—the Duchesse de Longueville. As the centre of this group reigned the Marquise de Rambouillet—"la grande Mar- quise," the divine Arthénice—and her beautiful daughter Julie (the Parthénie de Clélie), after fourteen years of singing, wife of the Duke of Mont- cassin, who inherited the Rambouillet, La Rochefoucauld, and of Julia, a collection of love-verses, illustrated with exquisite paintings on vellum.

The frequenter of the Hôtel were celebrated for the elegance of their manners and the refinement of their language; but the latter, on the lips of initiators, degenerated into extravagant affectation and palatable pedantry—a mark for the comic satire of Mollière in Les Précieuses Ridicules and Les Femmes Savantes. It must be remembered that the title Précieuse originally meant 'distinguished' in its best sense, and that the ladies of the coterie were generally divided into two classes: the younger Madame de Rambouillet's good taste in everything was conspicuous, and she led the fashion also in the decoration of houses. Her famous 'Chambre bleue,' furnished with blue velvet relieved by gold and silver, with large windows from floor to ceiling, and her alcove with its 'esquille—at first adopted merely to save her from the heat of the fire, which she could not bear—were imitated in many a great house in France. Her importance declined under Louis XIV., who distrusted clever women, but she survived to the month of November 1693.

See the History of Tallemand des Réaux and the Dictionnaire des Précieuses of Sounzie; Riederer's Mémoire pour servir à l'Histoire de la Société polié en France pendant le Dix-septième Siècle (1854); Victor Housin's Jésuites et Jésuites, de la Bourgogne de l'Ouest, &c.; Livre des Précieuses et Précieuses (1859); Brunet-édro's Nouvelles Études Critiques (24 ed. 1886).
RAMESAU. JEAN PHILIPPE, a French musician, was born at Dijon, 25th September 1863. At eighteen he went to Milan, but soon returned to France, to Paris, Lille, and Clermont in Auvergne. Here he acted as organist to the cathedral, and wrote his Traité de l'Harmonie (1723). Removing to England in 1763, he published several works, among which were Génération Harmonique (1737), and Nouvelles Réflexions (1752). In 1733, at the mature age of fifty, he produced his first opera, Hippolyte et Aricie, the libretto of which was written by the Abbé Pellegrin. It created a great sensation, and remained on the stage for many years. Rameau's best opera was Castor et Pollux, produced at the Académie Royale de Musique in 1737. Between 1733 and 1750 he composed twenty-one operas and ballets, as well as numerous harpsichord pieces. Louis XV. created for him the office of composer of chamber music, granted him letters of nobility, and named him a Chevalier de St. Michel. Rameau died 12th September 1764. See A. Pougín's essay (Paris, 1876)—Rameau's nephew, well known as giving the original stage production of Diderot's, which Goethe thought worth of translation into German, had actual existence, being Louis Sébastien Mercier (1740-1814), author of the famous Tableau de Paris.

Ramée, De La. See Ramus, and Ouida.

Rameses, the name of several Egyptian monarchs, of whom two, the first and the second, were specially famous (see EGYPT, Vol. IV. p. 240). It is usual to identify the warrior king Rameses II. with the Pharaoh of the oppression, and Rameses III. with the Pharaoh of the Exodus, though there is some difficulty in the identification. The capital of Rameses II. was founded at Deir-el-Bahari in 1881, that of Rameses III. at Boulak in 1886. The story of Rhampsinus (q.v.) seems to refer to Rameses III. For the treasures called Rameses, see Pittom.

Ramic. See Beemneria.

Ramilholes, a village of Brabant, Belgium, 14 miles by rail N. of Namur, is memorable as the place where, on May 23, 1792, the French forces under Marshal Villeroi and the Elector of Bavaria were defeated by Marlborough, with the loss of almost all their cannon and baggage, and thirteen thousand killed and wounded. This victory compelled the French to give up the whole of the Spanish Netherlands.

Rammohun Roy. Râjî Ram Mohàn Râî, founder of the Brahmo Somaj (q.v.), was born at Râdnânga in Bengal, in May 1772, his ancestors being Brahmans of high birth. He studied Persian, Arabic, and Sanskrit, and soon began to doubt the foundations of the ancestral faith. He spent some time studying Buddhism in Tibet, and gave offence there by his frank criticisms. He incurred the enmity of his family for his religious views, and lived at Benares till 1803. For some years he was resident in Calcutta. In 1811 he succeeded to affluence on the death of his brother. He published various works in Persian, Arabic, and Sanskrit, the object of the whole being the uprooting of idolatry. His influence was powerful in securing the abolition of sati. He also issued in English an abridgment of the Ramayana. He digested the Vedas, the ancient sacred books of the Hindu. In 1820 he published The Precepts of Jesus, the Guide to Peace and Happiness, accepting the morality preached by Christ, but rejecting belief in His deity or in the miracles, and wrote other manuals for the use of the Hindu, and a Christian Trinitarianism. In 1828 he began the association which grew into the Brahmo Somaj, and in 1831 visited England, where he was received with all but universal friendliness and respect. He took a lively interest in the Reform agitation, and gave valuable evidence before the Board of Control on the condition of India, but opposed himself, and died at Bristol, 27th September 1833.

See Miss Carpenter's Last Days of Rammohun Roy (1883). The full Bengali memoir (1881); and his English works have been edited by Jyogendra Chunder Ghose (2 vols. 1888).

Ramnagar, two towns of India: (1) a town of the North-Western Provinces, stands on the right bank of the Ganges, 2 miles above Benares. It contains a palace and residence of the Rajah of Benares, which rises from the banks of the sacred stream by a number of fine ghâts or flights of stairs. There is a fort, and whips and wicker-work chairs are manufactured. Pop. 11,830. (2) A town of the Punjab, on the Chenab River, 28 miles NW. of Gujranwala. It was a place of great importance in the 18th century, being then known as Kasulnagar, but was stormed by the Sikhs under Ranjit Singh in 1795, and its name changed to Ramnagar. It is now a place of only 6580 inhabitants, who make leather vessels. A large fair is held here every April.

Rampart forms the substratum of every permanent fortification; see FORTIFICATION.

Ramphastis. See Toucan.

Rampion (Campanula rapunculus; see Campanula), a perennial plant, a native of Europe, rare in England, with a stem about two feet high, and a panicle of very pretty pale-blue bell-shaped flowers. The radical leaves are ovate lanceolate and waved. The root is white and spindle-shaped, and was formerly much used for the table, under the name of Rampion or Ramps. The plant is now little cultivated in Britain, but is still commonly grown in France for the sake of its roots, which are used either boiled or as a salad, and of its young leaves, which are also used as a salad.

Rampur, the capital of a native state of India, in the North-Western Provinces, stands on the river Kosila, 110 miles E. by N. of Delhi. It manufactures damask, pottery, sword-blades, and jewellery. Pop. (1891) 75,530. —The state, entirely surrounded by British territory, has an area of 899 (another authority gives 945) sq. m., and a pop. of 541,914.

Rampur Bâneul, chief town of the Rajshahi district (area, 2561 sq. m.) of Bengal, stands on the north bank of the Ganges, is a centre of silk and indigo trade, and has an English Presbyterian mission; pop. 21,407.

Ramsay, Allan, Scottish poet, was born in the parish of Crawford, Lanarkshire, October 15, 1856. His father was a manager of the Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. At fourteen he was put apprentice to a wigmaker in Edinburgh, and followed that calling till his thirtieth year, by which time he had become known as a poet, having issued several short humorous satires and realistic descriptions, which were printed as broadsides, and sold in his shop or on the street for a penny each. He had also written (1716-18) two
did a very great service for the Scottish Episcopal Church by his work in connection with the Church Society, of which he was the first secretary and really the founder, and out of which grew the later Representative Church Council. But it is for the sake of the Church of this country—or rather of one of them—that his fame is secure.

Among his works, besides sermons, &c., are Memoirs of Sir J. E. Smith and Dr Chalmers, Diversities of Christian Character (1858), Faults in Christian Believers (1859), &c. In 1857 he prefixed (1861), &c. and 1869), and a number of others. But the book with which his name will always be identified is the Reminiscences of Scottish Life and Character, which had its origin in two series of famous letters (‘‘Changing Ideas and Habits’’) delivered in Edinburgh in 1856–57, and which remained in manuscript until 1921. A second series (pp. xxxvii., 221 pages) appeared in 1861. See the Memoir, by James Innes, prefixed to the 224 ed. (1874).

Ramsbottom, a manufacturing town of Lancashire, on the Irwell, 4 miles N. of Bury. The first Sir Robert Peel established calico-printing here, and it now manufactures of cottons, calicoes, ropes, machines, &c. Pop. (1861) 4194; (1851) 16,142; (1891) 16,720.

Ramsden, Jesse, a mathematical instrument-maker, was born at Salterhebble, near Halifax in Yorkshire, in 1735, and began life as a cloth-worker. About 1755 he moved to London, and shortly afterwards began to work as an engraver. His skill recommended him to the mathematical instrument-makers, the daughter of one of whom, Dollond, he married. Being of an inventive turn, he spent his best efforts in effecting improvements in the sextant, theodolite, equatorial, barometer, mercurial, and quadrant, and the like. He so improved the sextant that its range of error was diminished from 5 minutes to 30 seconds. He made the theodolite for the ordnance survey of England. He devised the mire, and made the first for Palermo and Dublin. He spent several years over an instrument for graduating mathematical instruments (see graduation), and published an account of it as Description of an Engine for Dividing Mathematical Instruments (1777). For this the Commissioners of Longitude awarded him £250. He was elected a Fellow of the Royal Society in 1766; he was president of it in 1785. He died at Brighton on 5th November 1800. Descriptions of some of his improved instruments will be found in Phil. Trans. (1779 and 1783). See Life by Lalande in Journal des Savans (1788).

Ramsey, (1) a seaport and watering-place in the north of the Isle of Man, 14 miles N.E. of Douglas, and by rail (1879) 18 N.E. of Peel. It stands on a spacious bay, with a good sandy beach and a background of wooded hills (1842 feet), and from the beauty of its surroundings and the salubrity of its climate has risen into a favourite resort of tourists and pleasure-seekers. It has two promenades, a mile and a half long, and steam-boat communication with Liverpool, Fleetwood, Glasgow, Greenock, Whitehaven, and Douglas. Pop. (1851) 2701; (1871) 3861; (1881) 4023; (1891) 4803.—(2) A market-town of Huntingtonshire, 12 miles N.E. of Huntington, it has a market and a fair. For the curacy of St Benedict’s abbey (1333). Pop. of parish (1851) 4645; (1891) 4684.

Ramsgate, a watering-place and seaport of Kent, in the south-east of the Isle of Thanet, 72 miles E. by S. of London, 4 S.E. of Margate, and 15 N.E. of Canterbury. From a small fishing village it began to increase in importance during the 18th century through successful trade with Russia and the East country, and through the
RAMUS

French grammar, rhetoric, morals, and theology all engaged his pen, and he seldom handled a subject to which he did not add some degree of elucidation. His followers were a widespread, and no less powerful body of thinkers and teachers; France, England, the Low Countries, Germany, Switzerland, Denmark, and even Spain had their Ramist.

Rana. See Frogs.

Rancé, Armand de (1626-1700), the founder of the Trappists (q.v.).

Ranching, the business of cattle-breeding as pursued on a large scale in the unsettled districts of the United States from the Mississippi to the Pacific coasts, and from the Bad Lands of the Upper Missouri to the Gulf of Mexico. The name is derived from the Spanish rancho, extending over 'mess' or 'mess-room,' but used in Mexico also for a herdsmen's hut, and finally for a grazing-farm, as distinguished from a hacienda, a plantation or cultivated farm. The speciality of ranching is that the territory is raised and kept in a half-wild condition, with little or no fencing or irrigation, and no artificial feeding. The life of the 'cowboys' and ranchmen, if no longer so wild and adventurous as it once was, is still sufficiently free, open, and exciting to have great charms for enterprising youths amongst whom rancheros are to be found not merely hereditary cattle-breeder and rough frontiersmen, but accomplished university-educated, in whom their scanty leisure cherishes their Old-World tastes for literature and music. To these are added not a few men whose past history would hardly bear looking into in helping to provide the materials of a strangely mixed society.

Large fortunes were made in the wild old days, but the gradual settlement of the ranching country has seriously embarrassed the business of the ranchman. The old cattle kings of the south had often ranges, under Spanish land-grants, extending over several hundred square miles, and would brand many thousand calves each year. Herds would be 'on the trail' for from two to four months, the cattle from Texas crossing Red River, and passing through Indian territory and southern Kansas to the railroad; but the gradual settlement of the country and the extension of railroads render these long trails impracticable and needless. The great events of the ranchman's year are the 'round-up,' when stock is taken, the cattle are branded, and such full-grown cattle gathered in herds—some still by the direct instigation of one of his most persistent enemies. Their annual branding, as a method of thinking, is vigorous, and his exposure of its puerile and useless subtleties is thorough. His system of logic, by which his name is marked by its logical definitions, its natural divisions, and its simplification of the rules of the syllogism; but it really adds little to logical science. What strikes one most, however, in Ramus is his universal intellectual activity.

Randall, James Ryder, the author of 'Maryland, my Maryland,' was born in Baltimore, 1st
January 1839, taught for a while in a Louisiana college, and then turned to journalism. Shut out from the army by a delicate constitution, he still gave powerful aid to the southern cause by his lyrics. These include, besides the one called for by the passage of the first Massachusetts troops through the streets of Baltimore, and the consequent bloodshed, 'Stonewall Jackson,' 'There's Life in the Old Land Yet,' and others. Since 1866 he has edited a paper in Augusta, Georgia.

Randazzo, a town of Sicily, at the northern foot of Mount Etna, with some old Norman churches. Pop. 9908.

Randers, a town in Jutland, on the Randers-Flord, 20 miles from its mouth in the Cattegat. Pop. (1870) 11,354; (1890) 16,617.

Randolph, Edmund Jennings, an American statesman, was born at Williamsburg, Virginia, 10th August 1733, studied at William and Mary College, and was admitted to the bar. In 1760 he helped to frame the constitution of Virginia, and became a prominent attorney and legislator. In 1766-68 he was governor of Virginia, and in 1787 he was a member of the convention which framed the constitution of the United States. He was working hard on a codification of the state-laws of Virginia when, in 1789, he was appointed by Washington as attorney at law of the United States. In 1794 he was made secretary of state, but after the president's signing of the Jay Treaty (1795) with England he resigned in order to be free to vindicate his own conduct. Meanwhile he was practically ruined by the responsibility which had been inerced, as part of the duties of his office, for certain funds provided for a foreign service; and, though he returned to the bar, he had to assign his lands and slaves. He died 13th September 1813. See Moncreif D. Conway, Omitted Chapters of History, disclosed in the Life and Papers of Edmund Randolph (1888).

Randolph, John, 'of Roanoke,' was born at Cawson, in Virginia, June 2, 1773. He was a second cousin of Edmund Randolph, and boasted the Indian princess Pocahontas among his ancestors. In 1799 he was elected to congress, where he became distinguished for his eloquence, wit, sarcasm, caution, and eccentricity. For thirty years he was more talked and written about than any American politician. Tall and meagre, peculiar in dress and manners, he was described as a strange mixture of the aristocrat and the Jacobin. He was the Democratic leader of the House of Representatives, but quarrelled with Jefferson, and opposed the war of 1812; he opposed also the Missouri Compromise, and stigmatised its northern supporters as 'Doughfaces'; and he sided against Jackson on the nullification question. From 1825 to 1827 he sat in the senate, and in 1830 he was appointed by the president to the diplomatic service. By his will he emancipated his numerous slaves, and provided for their settlement in a free colony. He died in Philadelphia, June 24, 1833. See Lives by Garland (2 vols. 1850) and Henry Adams ('American Statesmen series', 1882).

Randolph, Sir Thomas, a trusted agent of Queen Elizabeth I. He was born in 1532, lived abroad for safety's sake during Mary's reign, and after Elizabeth's accession was frequently employed in diplomatic missions to France, to Russia, and especially to Scotland. He was first sent thither in 1558, and at many a critical juncture for more than thirty years he preserved his master's interests. Among seven or more cases on the English courts, the Anglo-Cathedral (whose foundation-stone was laid by Lord Dufferin in 1886) and the other European churches, the native pagodas, a luna tic aylenium, the chief goal of Lower 1581 had to flee from Scotland for his life. He died in 1590.

Randolph, Thomas, poet and dramatist, belonged to a good Sussex family, but was born at his maternal grandfather's house in Northamptonshire in 1612. As a youth he studied at the minster and Trinity College, Cambridge, and was admitted to a fellowship. He early began to write, and gained the friendship of Sir Aston Cokain, Shirley, and Ben Jonson, who adopted him among his poetic sone. He seems to have lived a boisterous life, and two episodes of his own tell how he lost a finger in a brawl. He died before his powers had reached their maturity, in March 1635. He left a number of bright, fanciful, and occasionally too glowing poems, and six plays: Aristippus, or the Jovial Philosopher; The Conceived Peddler; The Jealous Lovers; The Muse's Looking-glass; Anytans, or the Impossible Dowry; and Hey for Honesty. His works were edited by W. Carew Hazlitt in 1875.

Ranelagh, this building was erected in 1742 on the site of the gardens of a villa of the last Earl of Ranelagh at Chelsea. Its rotunda was 150 feet in diameter, with an orchestra in the centre and a fountain. The chief amusement, promenading, as it was called, round and round the area below, and taking refreshments in the boxes, the orchestra performing meanwhile, is thus described by Smollett: ' One half of the company are following one another's tails in an eternal circle, like Don Quixote and Sancho Palmas, etc.; and the other half are drinking hot water, under the denomination of tea, till nine or ten o'clock at night to keep themselves awake.' But Johnson thought ' the coup d'oeil was the finest he had ever seen; ' and Walpole, whose letters contain many allusions to Ranelagh, writes, 29th June 1744: ' Every night I go to Ranelagh, which has totally beat Vauxhall. Nobody goes anywhere else; everybody goes there.' The last appearance of Ranelagh was when the installation ball of the Knights of the Bath was given there in 1802. It was closed on 9th September 1803, and built upon next year. Its site is now part of the Chelsea Hospital garden.

Ranelagh, North and South, two suburbs of Dublin, lying south of the city.

Range. See Cannon, Gunney.

Rangoon, the capital of Lower Burma, stands on the Hlinau or Rangoon River, about 20 miles from its entrance into the Gulf of Martaban. The existing city is almost entirely of modern construction, built since the British took possession of the place in 1852. The town extends along the left bank of the Hlinau, the docks being opposite to it at the suburb of Da-la, on the other side of the river. Behind the town is the large military cantonment, grouped round the fortified hill (166 feet) on which stands the Shway-Dugon pagoda, ' the most venerated precinct of Rangoon worship ' in all the Indo-Chinese countries. It is built of brick, is massively gabled, and tapers up to a cone 321 feet above the ground (see illustration under Burma). According to the tradition, it was erected in the 6th century B.C. to serve as a refuge to eight hairs from the head of Gautama Buddha. The street is regulated, but not entirely; the river is carefully embanked; there are five markets and an excellent water-supply; the thoroughfares are systematically lighted and traversed by tramway cars; and there has been an elective municipality since 1853. Forts and batteries protect the town. There are numerous official and semi-official offices, the Anglican cathedral (whose foundation-stone was laid by Lord Dufferin in 1886) and the other European churches, the native pagodas, a lunatic asylum, the chief goal of Lower
Burma, the Phayre Museum in the horticultural gardens, St. John's College, the high school, a hospital, &c. Along the river-side are numerous rice-husking-mills and sawmills. Pop. (1852) 25,000; (1872) 89,897; (1881) 134,176; (1891) 181,210. A little less than one-half are Burmese, and the rest are Chinese. The principal port in all Burma is about 86 per cent. of the total trade of that country passing in and out at this port. Its trade has grown at a wonderfully rapid rate since the British took possession of Lower Burma. In 1852 the port was entered by not more than 30 small vessels, and even in 1858 the total imports and exports together had only risen to £2,131,000. By 1878 the statistics of the port stood at 593,000 tonnage of vessels entering; value of imports £3,777,700, and of exports £4,414,300. Since 1890 the port is entered by about 1000 vessels annually of some 1,000,000 tons burden; the total imports (excluding coasting trade) are valued at about £5,000,000 a year, and the total exports at £9,000,000. The chief exports are rice, teak, indiarubber, raw cotton, and other articles mentioned in the beginning of the sixteenth century. The importation of Burmese with British India, Rangoon ranks as fourth of the commercial cities of the Indian Empire. A town has existed on the site of Rangoon since the 6th century n.c. It was always called Dagon down to the capture of the place by the Burmese sovereign Alompra towards the end of the 13th century. That prince rebuilt the place and called it Rangoon. It was taken by the British in 1825, and held until 1827; they captured it again in 1832, and have kept possession of it ever since.

Rangpur, a town of Bengal, on the Ghaghat, an arm of the Brahmaputra, and 110 miles SE. of Darjiling. It is the capital of a district in a great well-watered region, well-tilled plain of sandy loam. Pop. 14,500.

Ranjit Singh, the founder of the Sikh kingdom in the Punjab of India, was born at Gujmirwa on 21 November 1780, the son of a Sikh chief. His father died when he was twelve and his mother when he was seventeen years old. He at once began to study the code of the Sikh law, and at the age of thirty after the shah of Afghanistan had given him the province of Lahore he directed all his energies to the founding of a kingdom which should unite all the Sikh provinces under his own personal rule (see Sikh History). He died on 27th June 1839, and was procured from an Afghan prince, as the price of his assistance in war, the famous Koh-i-nur diamond (see DIAMONDS). See Sir L. Grillon, Ranjit Singh (Oxford, 1892).

Rank in the military forces of the British empire is not confined to the commissioned classes; the various grades of non-commissioned officers, and even the titles gunner, driver, sapper, or private are officially styled ranks. Lance or acting rank is a temporary advancement. Thus, a private or sapper is first made a lance-corporal, and a gunner or driver an acting-bombardier, before being permanently promoted. Until so promoted they rank only as private soldiers. Similarly a lance-sergeant is a corporal acting as sergeant, and holds only the lower rank.

Officers of the army and royal marines may hold either regimental or army rank or both. Up to 1857 there were two headquarters for the army. Afterwards a captain may be promoted in his regiment to the successive ranks of major and lieutenant-colonel, or while remaining a captain in his regiment he may become a major or lieutenant-colonel in the army by brevet (q.v.). The rank of captain is carried by the brevet or on receiving an appointment, such as assistant-adjutant-general, which carries that rank.

The several grades of General (q.v.) are also army ranks only. Local rank is sometimes conferred on an officer to enable him to exercise command over others senior to him in a certain locality (South Africa, Egypt, &c.). Temporary rank is often similarly granted, and some appointments carry temporary rank, more particularly the senior quarter-master-general in India becomes a temporary major-general while so employed, and reverts to the lower rank at the end of his five years' term of office unless promoted in the meantime. Honorary rank is held by officers of the ordnance-store and by the ordnance officers, regimental surgeons (q.v.) and riding masters. Officers of the militia, yeomanry, and volunteers also, after a certain number of years' service, receive a step of honorary rank. Substantive rank includes all rank other than army, brevet, honorary, local, and temporary rank, held by officers unless they are on the unemployed half-pay list. Half-pay rank as lieutenant-colonel (£200 a year) may be taken by an officer after seven years' service as major. Relative rank is held by army chaplains and veterinary surgeons. It is indicated by the position of the colonel on the shoulder-strap, and by attaching to the military rank with which it corresponds, and regulates rates of lodging-money, number of servants and horses, rates of fuel and light (or allowances in their stead), detention and prize-money. It does not entitle the holder to commands from the Queen, or to appointment out of guards, and, of course, it does confer any right to command. The corresponding ranks in the army and navy are shown in the following table, where the asterisks denote 'according to date of commission,' and the dagger 'junior of the rank.'
1889, perhaps the most finished of his books, certainly one of his great masterpieces of historical writing. Then he turned his attention to central and northern Europe, and wrote in quick succession Deutsche Geschichte der Zeit der Reformation (1839–47); Zweift Bucher preussischer Geschichte (1847–48; new ed. 1871–74); Französische Geschichte (1852–61); Englische Geschichte (1859–67; 4th ed. 9 vols. 1877–79), the last two treating chiefly of the same two centuries as the books on south Europe; and Zur deutschen Geschichte Wertung der Geschichte des 16. Jahrhunderts, (1881–88), a historic political work. It was an immense task, and required a masterly hand to produce it. The book is a classic of modern German historiography.

In 1868, Rankine became a professor of engineering at the University of Edinburgh, and in 1874, he was appointed professor of civil engineering at the University of Glasgow. He died on 24th December 1872. Rankine's work in engineering was significant. He made contributions to the fields of structural engineering, heat transfer, and fluid flow. He is best known for his work on the strength of materials, which led to the development of the Rankine's formula for stresses in realistic structures. His work on the steam engine was also groundbreaking, and he was one of the first to apply the principles of thermodynamics to the design of steam engines. His contributions to this field were instrumental in the development of the steam engine as a practical and efficient power source.

Another side of his nature was seen in his capital humorous and patriotic songs, collected as Songs and Fudges (1874).

Annach, a bleak, desolate moorland of north-west Pittshire, with a mean elevation of 1000 feet above sea-level, and measuring 28 miles by 15. Its surface is mostly a broad, silent, featureless tract of bog, heath, and moss, girdled by dark, distant mountains. In its western part is Loch Lydnoch (54 miles by 3; 924 feet above sea-level), which was said flat and dismal scenery. Stretching eastward from the moor is Loch Rannoch (92 miles by 8 mile; 608 feet), which is overhung by Schiehallion, contains a crannog with a later fortress, and sends off the Tummel 29 miles eastward and south-eastward to the Tay. Loch Tummel (62 miles by 3, 290 feet) is an expansion of this river, on which are also the Falls of Tummel, 20 feet high.

Ransom—corrupted from the Latin redemption— is the price paid by a prisoner-of-war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when a city or a prince received as hostage, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit, he would make him his slave, or sell him for a price. It would be natural to accepting compensation from the prisoner himself, and setting him at liberty. In feudal warfare the ransoms formed a large portion of a soldier's gains; those for persons of low degree belonging to the individual captors, but those for princes or great nobles to the king. Ransoms were sometimes of large amount, more than the immediate family of the captive could pay. His retainers were then required by feudal usage to contribute; as in the case of redeeming King Richard I. for £100,000, when twenty shillings was assessed on every knight's fee, and the clergy subscribed liberally. David Bruce of Scotland was ransomed for 100,000 marks, and King John of France for £500,000, payable in instalments. After the battles of St Quentin and Grave, in the war between France and Philip of Spain, the King of France was ransomed by the Prince of Orange, Counts Egmont and Horn, and a few other superior commanders were estimated at 2 million crowns; the Duc de Longueville paid Count Horn 80,000 crowns as his ransoms. In modern warfare, where the fighting is performed by professionals, the pecuniary conditions of the ransoms have resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side.

Ranters. See Methodists.

Ranunculaceae, a natural order of exogenous plants, mostly herbaceous, rarely shrubs, and generally natives of cold, damp climates. Some are found within the tropics, but almost exclusively in very elevated situations. The number of known species far exceeds 1000. They occur in all quarters of the globe, but most abundantly in Europe. The leaves are generally much divided, and have dilated shining stalks. The calyx is of 3–6 deciduous hypogynous sepals; the corolla of 3–5 hypogynous petals, in very remarkable forms, as in larkspur, aconite, and colchicum; rarely absent, in which case the sepals are gaily coloured. The stamens are usually numerous; the carpels are numerous, one-celled, sometimes united into a single many-celled pistil; the ovary is superior, and the seed consists of dry achenia, or is berry-like or follicular. Acridity is the prevailing character of the order,
and the leaves of some species readily produce blisters; but this property disappears when they are dried or heated. Many are narcotic and poisonous; some are used in medicine, as aconite and hellebore. The seeds of *Nigella sativa* were formerly used instead of pepper. The fruit of the May Apple or Wild Lemon (*Podophyllum peltatum*) of North America may be eaten, but is very acid. Many of the order produce flowers of great beauty, as some species of Ranunculus (q.v.), Anemone (q.v.), Larkspur (q.v.), Peony (q.v.), Columbine (q.v.), Clematis (q.v.), &c.

**Ranunculus**, a genus of plants of the natural order Ranunculaceae; having five sepalae; five petals, with a nectariferous pore at the base of each petal, often covered with a scale; many stamenae situated on a receptacle, and ovaries accumulated into a head. The species are numerous, herbaceous plants, mostly perennial. Some of them adorn meadows with their yellow flowers, familiarly known as Buttercups; others, known by the sides of ditches, &c., is an active and powerful emetic, producing almost immediate vomiting, and capable of being used with great advantage in cases of poisoning. Yet the leaves of *R. ranunculoides* are sometimes called Pilewort and Lesser Celandine, a very common British species, adorning hedge-banks with bright yellow flowers in spring—are capable of being used as a pot-herb. Pastures in which *R. acris*, *R. repens*, &c. are very abundant are injured by them, and they ought to be diligently grubbed out; they are particularly supposed to give an unpleasant taste to milk and butter; but it is thought not improbable that a moderate mixture of these plants with the other herbage is even advantageous, and that they may act as a condiment. Their acridity is lost in drying, and they are not injurious to hay. The small tubers of Pilewort, or Lesser Celandine, are used for the cure of haemorrhoids; but their acridity also disappears when they are boiled, and they are then a pleasant article of food. *R. aquatilis*, a British species, very abundant in streams in many parts of Britain, is eaten with relish by cattle, the acridity so general in the other species being wanting in it.

**Ran des Vaches** (in German, *Kuhreigen*), a name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on the Alphorn or Kuhhorn (q.v.). The associations of pastoral life recalled by these airs to the Swiss in foreign countries have been said to produce an almost irresistible longing for home, or nostalgia.

**Rap** (contracted from *rappace*, 'an Irish plunderer'), familiar in the phrase 'not a rap,' was a counterfeit Irish coin of the time of George I., which passed for a halfpenny, though not really worth a fourth of that value. There was also a small Swiss coin called *rappen*, worth a centime.

**Rapallo**, a winter health-resort of Northern Italy, 17 miles by rail ESE. of Genoa, with a castle and the pilgrimage church of the Madonna (1537) on the Monte Allegro. Off here the Venetian fleet defeated the Genoese in 1491. Pop. 7625.

**Rape**, or **Coleseed** (*Brassica napus*; see *Brassica*), an annual plant much cultivated on account both of its herbage and of its oil-producing seeds. It is a native of Europe and perhaps of England; but it is hard to say where it is truly indigenous and where naturalised. It is so nearly allied to *Brassica rapa* (Turnip), *B. campestris* (Swedish Turnip, Colza, &c.), *B. oleracea* (Kale, Cabbage, &c.), and *B. prae co* (Summer Rape) that botanical distinction is difficult, particularly as to some of the cultivated varieties. The root of rape is slender, or, when cultivated sometimes becomes carrot-shaped (see *Nayew*), but it never becomes turnip-shaped. The cultivation of rape is very general in many parts of the continent of Europe, from which it seems to have been introduced into England at least as early as the 16th century; and in the 17th

---

**Rape** *Brassica napus*; a, whole.
RAPE

century, if not sooner, large quantities of oil were made from its seeds, chiefly in the fenny and other alluvial districts of the east of England, where also it has long been most extensively employed for feeding sheep. On the Continent it is not unusual to sow rape in order to green-manuring, ploughing it in, and it is also extensively cultivated in the chalk and chalk districts of the south of England. When cultivated for green-manuring rape is usually sown broadcast, but when intended to produce seed it is generally sown in drills, and receives manure and culture the same as the turnip. In rich soils rapeseeds are found useful in preventing weeds, for four feet, so that the sheep turned in are hidden beneath the leaves, and seem to eat their way into the field. They eat the stalks even more greedily than the leaves. A too exclusive feeding on rape is, however, apt to produce diseases, which a small dressing of salt, a handful of hay, is often found useful in preventing. When the seed is ripe rape is cut with the sickle; and, after a short time allowed for drying, the seed is threshed out, when the floral is often burned, a wasteful practice, as its decay affords more abundant and useful manure, and also it helps to prevent, if not, the mass of seeds from which oil has been obtained by crushing, is used for feeding oxen and sheep, but is very inferior to linseed-cake and some other kinds of oil-cake. Ground into dust, it is a very valuable manure. Rape-oil is extensively used for machinery and for lamps; but the oil and cake so-called are not exclusively obtained from this plant, nor are the names Colza-oil and Rape-oil used to discriminate the produce of different plants, although in some parts of Europe the name Colza is given to varieties of Brassica napus and B. oleracea, which are cultivated in the same way as rape. B. pretiosa is also cultivated in some places, being sown in spring and reaped in autumn. The seeds of other cruciferous plants are also crushed indiscriminately with these, and the oil and cake sold by the same names (see Oils, OIL-CAKE).—The name of the plant, rape, is through the French from the Dutch *koolzaad*, *kale-seed*.

*Rape* is having carnal knowledge of a woman without her conscious consent, and such consent must not be extorted by violence or threats of violence. The Criminal Law Amendment Act, 1885, provides that a man is guilty of rape if he persuades a woman’s husband he succeeds in having connection with her. Previously the point was doubtful. A husband cannot under any circumstances commit rape on his own wife, her consent at marriage being irrevocable; but Mr Justice Stephen in *R. v. McLean* (1879) said: The attempt to have unlawful carnal knowledge of a girl under fourteen is at all events attempted in the case of a girl between thirteen and sixteen (save when the accused reasonably believes her to be over sixteen), or in the case of any female idiot, under circumstances which do not amount to rape, are misdemeanours, punishable by two years’ imprisonment with hard labour. The mere presence suffices to constitute the crime. As regards evidence in cases of this sort, the most important question will usually be, How far is the supposed injured person to be believed? That depends on many things, of which the chief are (1) her character for truth as a matter of course, since every· girl might be compelled to submit to outrage, yet in fact if the chief witness is shown to be untruthful the charge almost invariably breaks down; (2) the time within which and the person to whom she made the first complaint; (3) any marks found on her dress or person; and (4) any marks of violence on her dress or person; (5) any marks of violence on her dress or person; (6) any marks of violence on her dress or person; (7) any marks of violence on her dress or person; (8) the scene of the alleged crime, and the probability of strenuous resistance attracting public notice; (9) whether the prisoner fled or not; (10) any marks of violence on her dress or person. (11) If one who after consenting resists too late, or who tries when by any accident the fact of connection becomes known to whitewash her character.

The law which protects women against the class of crime of which rape is the chief has been made much wider by the Criminal Law Amendment Act of 1885, which contains provisions against various kinds of procurement. As regards the abduction (1) of a woman on account of her fortune; (2) by force with intent to marry; (3) of an unmarried girl under the age of eighteen with intent to have carnal knowledge of her, it need only be remarked that the first two are felonies punishable by fourteen years’ penal servitude, and the third a misdemeanour punishable by two years’ imprisonment with hard labour.

In the United States the crime is everywhere treated as a felony, and punished with imprisonment for life or for a number of years; but the punishment is somewhat different in the different states of the Union. See also *Abduction*.

**Raphael Santi**, born at Urbino in 1483, died at Rome 1520, was the son and pupil of Giovanni Santi, a painter, whose death took place in 1494. Apprenticed to his father in 1495 at Perugia, he learned his profession from Perugino, and became such a clever imitator of his style that to this day the early pictures of the disciple are confounded with those of his teacher. Raphael, in fact, copied Perugino’s drawings (Academy of Venice), helped to work at Perugino’s pictures, and finished all the pieces from Perugino’s designs. Examples are the Resurrection of the Virgin and the Virgin and Child, with and without attendant saints, at Berlin. The presence of Raphael during these years at Perugia, Urbino, and Città di Castello may be traced in the existing collections and in private places. His first patrons were the Duke and princesses of Urbino, ecclesiastical corporations at Città di Castello, and ladies of the high families of Baglione and Oddi at Perugia. His earliest commissions were those of Città di Castello, where (1502-3) the most important of his early works, the Crucifixion in the Dudley collection, was painted. An Assumption of the Virgin, now at the Vatican, was executed shortly after for Maddalena degli Oddi. Distinct features in these pictures are a great independence as to form on Perugino and Pinturicchio, combined with a feeling for grace and pure colour essentially original. In a Marriage of the Virgin of 1504 (Milan gallery), these qualities are found in conjunction with exact repetitions of Perugino’s figures. It is probable that about 1504 Raphael began to discern the
advantage of greater independence. His predellas of the Vatican Coronation, and especially the Epiphany of that series, already display some acquaintance with the more advanced methods of the time, for some time longer the paramount influence of Perugino remained manifest, and Raphael showed Peruginesque influence in such pictures as the Connectable Madonna, now at St Petersburg, the Vision of the Knight in the National Gallery, the little St Michael and St Catherine, or the Assumption of the Louvre, and the Graces belonging to the Duc d'Annalle at Chantilly. The painting of the Graces is obviously connected with a journey which Raphael made to Sienna in 1505, when he gave assistance to his friend Dati, painting the frescoes for frescoes in the Piccolomini library. It was there that he copied the Graces, of which the sketch is preserved at the Venice Academy. At Sienna Raphael probably heard of the competition between Leonardo and Michelangelo, who were rivals in 1505 for the decoration of the town-hall of Florence, and there is good cause for thinking that he accompanied Perugino to that capital to be near the lists of this artistic tournament. But before starting he probably took commissions, which gave as a final result the Virgin, Child, and Saints, in full length, called D'Amico, now in the National Gallery, and the Virgin and Child with four saints, called the Madonna of Sant' Antonio, belonging to the Ripalda family, both of which were delivered at Perugia. The Madonna of Terranova, a group of half-lengths at the Berlin Museum, i.e., the one which Raphael was now on the path which Perugino had trod before him, had a painting-room at Florence and a painting-room at Perugia, but was not satisfied as his master had been with that finality which caused Perugino to remain stationary in the rut of an old style. He determined to acquire and assimilate some of the boldness of Michelangelo, and the principles which Leonardo had been teaching to the students of his academy at Milan. When, after a short absence at Florence, he resumed work on the Annsele and Sant' Antonio Madonna, he appears much as he could of the new spirit which was in him to those compositions, without being able to alter their archaic character. In the second of these pictures some heads, recast in a new mould, reveal the influence of the Vicenza, for it is certain of Raphael that, after witnessing the struggle of that master with Michelangelo, he came for a time to the conclusion that Leonardo was the better man so far as grace and expression were in question, though for action the spirit of Michelangelo might be preferable. The Terranuova Madonna shows the struggle in which Raphael was engaged. It has the brightness and sweetness of the Umbrian with the breadth of execution of the Florentine. But similar characteristics distinguish the five small predellas which once formed part of the Madonna; the predella for the Monti, in Lord Lansdowne's collection at Bowood, and part of the predella of the Annsele Madonna, display the influence of the works of Masaccio, Filippino, and Ghirlandajo. It is not historically proved that Raphael and Da Vinci worked together, and all the pictures which left Raphael's easel at Florence in 1505-6 recall Leonardo in expression, concentration of lines and light, tempered atmosphere, and subtle combinations of movement and light. Examples are Madonnas and Holy Families, of which the most conspicuous are that of the Gran Duca, the small Cowper, the Cardellino, and Casa Temp., at Florence, and the Virgin in Green at Vienna. But in portrait more than elsewhere the lessons of Da Vinc are visible, and the likeness of Maddalena Doni at Florence is inspired by the Mona Lisa of the Louvre. Of special interest to Englishmen was a campaign of Raphael's, in which he was sent by the Duke of Urbino to Henry VII. of England, in return for the garter given by that prince to Guidubaldo of Montefeltro. Attractions in other ways are the painter's own likeness at the Ullizi, in which we discern that the grace of his art was also displayed in Raphael's person, the Madonnas of Orleans, of the Palm, of St Petersburg, and Canigiani, in which Raphael finally appears as a pure Tuscan familiar with the arts of all his Florentine contemporaries. The Entombment to which Raphael now turned his attention is one of Assunta Baglioni and recalls in many ways the misfortunes which attended the worthless family of that name, which had so long governed Perugia. The sketches for the picture contain incidents that remind us of a massacre in which Atalanta lost her son. The picture in the Borghese palace is an embodiment of all the new principles which Raphael acquired at Florence, realizing the perfect drawing of Da Vinci and the sculptural shape of Michelangelo, allied to Peruginesque softness, and colour such as only Raphael could give. The result is perhaps a little less delightfulness, but the colouring is now at its height. The predella representing Hope, Faith, and Charity. As this fine work advanced to completion Raphael became very evidently attracted by the style of Fra Bartolommeo, and, under the influence of that master of monumental painting, he brought in part to perfection the Apostles and the Magdalen of the Eternal, in a fresco at San Severo of Perugia, whilst he composed and finished the Madonna del Baldecchinio at Florence. During the progress of these works Raphael got into a large practice at Florence, where he reigned supreme in the absence of Perugino, Leonardo, and Michelangelo. Some of the best work of his Florentine period was now produced—the small Holy Family with the Lamb at Madrid, much in the spirit of Da Vinci; the St Catherine of the Louvre; the Bridgewater and Colonna Madonnas; the Virgin and Sleeping Infant of Milan; the Raphael and the Madonna of the Bella Giardiniera, and the Esterhazy Madonna. From the days of Giotto and Masaccio to those of Raphael Rome had always attracted to its centre painters and sculptors of acknowledged skill in their cities. In this city of Michelangelo, Raphael became the great master of his age. The days of the Medici were waning, and the new Medici, the Farnese, felt the influence of the Vatican and the French court. But to Raphael's art the Farnese contribution was slight. Though not the only one, he was the best of the followers of the Anti-Secular faction the Farnese supported, and it was to Raphael that the Farnese turned when they needed a new artist for the decoration of their palace. In 1511, the Medici were exiled from Florence, and the Farnese occupied the palace. The Farnese were the last of the independent Medici, and Raphael was the last of the independent painters. Raphael's engagement to paint the 'Camera' of the Vatican is now fixed with certainty as 1509. In the ceiling of the chamber of the Signaturc the space is divided into fields, in which the Temptation, the Judgment of Solomon, the Creation of the Universe, and Mary and Abimelech are inserted side by side with medallions enclosing allegories of Theology, Philosophy, Justice, and Poetry. All these pictures exhibit an expanded style, in which the spirit of Perugino, quickened by the splendour of Leonardo and Fra Bartolommeo, becomes associated with the antique. Never before had the artist had such an opportunity of study as now. When at Rome he was enabled to visit the treasures of old sculpture and
RAPHAEL SANTI

genius at the Vatican, and the collections of the cardinals Rovere and Medici. On the walls of the
camera Raphael began the Disputa, in which he represented the Eternal, Christ, Mary, and the
apostles and angels presiding in heaven over the sages of the earth. It became legendary;
noteworthy in this madcap rendering of form, and
Published so that by a pictorial license the pontiff is present as the scenes are enacted. The death of Julius early in
1513 but slightly interrupted the labours of the painter, who gave a noble rendering of Leo X.
and his suite in the picture of the Defeat of Attila.
The Deliverance of Peter, which closed the decora-
tions, was an effective piece of composition, in which Raphael for once indulged in contrasts of
torch and moonlight and glare balanced by power-
ful glow. The constant employment of disciples
enabled Raphael, in the three years which elapsed
between the completion of the two chambers—i.e.
between 1511 and 1514—to finish the Madonna di
Pellegrino at the Palazzo Sangallo at Foligno, the
Galatea of the Farnesina, and the Sibyls of the
Pace, not to speak of the mosaics of the
Popolo ordered by Agostino Chigi. In many
of these works Raphael’s style is equal to that of
Michelangelo at the Sixtine, with the additional
charm of a more practical style. The audience
of the antique under contribution with great skill
and success, and his art was that of a master who
works without hesitation because ready for every
form of effort that can be required of him. In
a graver mood he also painted at this time the severe
Madonna of the Fish at Madrid, in a playfully
sweet mood the Madonna della Sedia at Florence;
whilst in portraits such as Altoviti at Munich, and
Inghirami at Florence, he rises to the perfect
rendering of features and expression which finds
its greatest triumph in the Leo X. of Florence.
Raphael, who had been greatly favoured by Julius,
became a personal favourite of Leo, who selected
him to succeed Bramante as architect of St Peter’s
in 1514, and afterwards made him inspector of
Roman ruins. But he was as impatient as his pre-
decessor to get the Vatican chambers finished, and
the successive succession of popes interfered with his
plans. He worked at the frescoes of the Camera dell’ Incendio, which all illustrate
scenes from the lives of Leonicin popes: the
Fire of Borgo, in which all the remants of Roman
buildings known to Raphael are introduced, the
Battle of Ostia against the Saracens, the Corro-
mination of Charles V, the Siege of Bologna,
but Raphael was now too busy to attend per-
sonally to wall-painting, and much of his attention
was taken up with the composition of the cartoons
which he executed, with help from assistants, for
the tapestries of the Sistine Chapel. It would be
impossible to describe these masterpieces or the
tapestries made from them in the space here at our
command. The cartoons may be seen at the
Kensington Museum, the tapestries at the Vatican.
They are masterpieces worthy of a pilgrimage; the
first completed in December 1516, the second
woven at Brussels in 1519. At this period of his
career Raphael was a welcome guest in the best
circles of Rome, painted the likenesses of the
pope’s relatives, Giuliano and Lorenzo de’ Medici,
and was asked in vain for pictures by the Duke of
Ferrara. His portraits of the Duke of Urbino,
Castiglione, and the Duke of Mantua are among the
most famous of Cardinal Bibiena’s rooms at the Vatican tell of
the company which he frequented. When Leo X.
succumbed to Francis I. after Marignano Raphael
followed the pontiff to Florence and Bologna, and
found there the new patrons for whom he executed
the Sixtina Madonna, the St Cecilia of Bologna,
and the Ezechiel of the Pitti. The labours subsequently completed were immense, including the Spasso at Madrid, the Holy Family and St Michael, which the pope sent to the king of France in 1518, and the likeness of the vice-queen of Aragon, followed by the celebrated portrait of the violin-player of the Sciarra collection at Rome. Wall-painting, with help from the assistants, was diligently carried on, and produced the cycle of the Psyche legend at the Farnesina, the gospelscenes of the Loggie of the Vatican, and the frescoes of the Hall of Costabili at Tivoli. The last work done in the master's painting-room was the Transfiguration, which was nearly finished when Raphael died of a pernicious fever caught in the excavations of Rome. He expired on the 8th of April 1520, after a week's illness.

Raphae, or EGGSOMUS, is a disease which was much more prevalent some centuries ago than it is at present. The name raphania was first given to it by Linnaeus, who thought the morbid symptoms were dependent upon the mixture of Raphanus raphanistrum, or jointed charlock, with the wheat used as food. It was suspected, as early as the 16th century, that the disease was due to the development of a fungus in the grain, and this fact is now established beyond doubt, although some writers hold (as Linnaeus did) that this morbid state is also produced by the presence of poisonous plants, especially Lathyrum temulentum, or darnel, among the grain. Deficiency of proper food probably contributes to cause the disease, for it rarely occurs when ergot is used medicinally. Although rye is the ordinary seat of the poisonous fungus, wheat, rice, and other grains are liable to be similarly affected, and to produce similar symptoms.

There are two forms of the disease—the spasmodic and the gangrenous. In both, symptoms of irritation of the digestive organs are the first to appear. In the spasmodic form tingling or itching of various parts of the body, with loss of sensation in the feet and hands, are the most constant symptoms. Violent contractions of the muscles may occur, giving rise to intense pain, and sometimes epileptic convulsions supervene. In the gangrenous form the extremities are painful, red or blue, and the skin distended; and after a varying time gangrene supervenes. With regard to treatment, the main thing is to replace the poisonous flour by easily digested, wholesome food. Whatever be the form of treatment adopted, the mortality in the gangrenous form is usually 90 per cent. The spasmodic form is much less destructive to life.

Raphia, the name of a group of palms (see Vol. VII. p. 722), the leaves, bark, and pitch of which found various applications. The best of one South American species, R. toedora or Jupati-palm, is largely used by gardeners everywhere for tying up plants, in fastening grafts, &c. And the midrib of the leaves of another species, found in Madagascar, &c., are supposed to be what was used for roc's quills, the feathers of the fabled Roc (q.v.).

Raphoe, a market-town of Donegal, 15 miles SSW. of Londonderry. Its former see was united to Derry in 1835. Pop. 980.

Rapidan, a river of Virginia, and tributary of the Rappahannock (q.v.).

Rapids. See Waterfalls, River, Niagara, Nile, Parana.

Rapiers, light, highly tempered, edgeless, thrusting weapon, finely pointed, and about 3 feet in length. It was for long the favourite weapon in duelling, and was worn by every gentleman. At present it is worn only on occasions of court ceremonial, and answers no other purpose than to recommend the wearer. Instructions for fencing (q.v.) are for fencing with the rapier or foil. See SWORD.

Rapin de Thoryas, Paul de, a French historian, was descended from a Protestant Savoyard family, which settled in France in the 16th century, and was born at Cauterets, in the Pyrenees, about 1627. He was educated at the Protestant college at Saumur, and passed as advocate in 1679, but had no liking for the profession; and when the revocation of the Edict of Nantes (1685) forced him to leave France he sought employment without success in England, and afterwards in the Low Countries, where he enlisted as a corps of volunteers at Utrecht, formed by his cousin, Daniel de Rapin. With his company he followed the Prince of Orange to England in 1688, was made ensign in the following year, and distinguished himself by his bravery at the siege of Fort L'Isleworth, and at the siege of Limerick, where he was shot through the shoulder by a musket-ball. In 1693 he was appointed tutor to the Earl of Portland's son, with whom he travelled in Holland, Germany, and Italy, after which he took up his residence at the Hague. He died in 1727 with his family in Wesel, where he devoted the remaining seventeen years of his life to the composition of his great work. The severity of his labours is believed to have shortened his days. He died May 16, 1725. Rapin's Histoire d'Angleterre was published at the Hague in 8 vols. the year before his death. It was undoubtedly, as Voltaire has said, the best work on English history that had until then appeared; full, minute, careful in the citation of authorities, clear, rapid, and accurate in narration, methodical in arrangement, and at the same time, comparatively impartial in spirit, and yet betraying on the part of the author an honourable reverence for law and liberty.

Rapin begins with the invasion of Britain by the Romans, and ends with the accession of William III. The work was continued to the death of William III. by David Imray (Hague, 2 vols. 1731). The best edition of the Histoire in its augmented form is by Lebrevo de Saint-Maur (Hague, 16 vols. 1749 et seq.). The original was translated into English by the REV. Nicholas Tindal (London, 15 vols. 1725-31), and subsequently by John Kelly (in 2 vols. fol.).

Rapp, George, founder of the Harmonists, also known as the sect of Economists, was born in Wurttemberg in 1727, and in 1756 he attempted to restore the church of New Testament days in Germany, emigrated with his followers to America in 1803 and settled in Butler county, Pennsylvania. There he established a settlement which he named Harmony. In 1815 the community removed to Indiana and in 1827 the tract of land on which it was sold in 1834 to Robert Owen, and Rapp and his followers returned to Pennsylvania, where, on a tract of 2400 acres forming Harmony township, in Beaver county, they built the village of Economy, on the right bank of the Ohio, 17 miles N.W. of Pittsburgh. There they engaged in manufactures and agriculture, and there Rapp died 7th August,
Rapp, Jean, Count, a French general, was born at Colmar, in the French department of Haut-Rhin, 27th April 1772. He was intended for the clergy, and, having commenced artillery, he married a woman who bore him a son, and would not leave him until he could enrol himself (1788) in the mounted ‘chevaux’ of the French army. Rapp distinguished himself by dashing gallantry in Germany and Egypt, and on the death of Desaix at Marengo he became aide-de-camp to Napoleon. His brilliant charge at Austerlitz upon the Russian imperial Guard was rewarded with the grade of general of division (1805). For his services at Loban he was named a Count of the Empire (1809). He opposed the Russian expedition, but accompanied the Emperor throughout the whole of it. His obstinate defence of Lissa (1810) a year after Napoleon’s victory at Austerlitz, and the cruel Russian army gained for him greater renown, and his chivalrous and considerate treatment of the unfortunate inhabitants during the siege was warmly appreciated by them. The Russians, contrary to the articles of capitulation, sent Rapp and his garrison prisoners to Russia, and he did not return to France till July 1814. On reaching Paris he was well received by Louis XVIII; but in 1815 he went over to his old master, and was appointed commander-in-chief of the army of the Illyrian peninsula. After Waterloo Rapp again submitted to Louis. He re-created a peer of France (1819), he held various offices about the court, and died at Paris, 8th November 1821. See his Memoirs (1823), and Spach’s Biographies Anecdotiques (1871).

Rappahannock, a river of Virginia, rises in the Blue Ridge of the Alleghany Mountains, receives the Rapidan (above this point it is sometimes called the North Fork), and flows about 125 miles south-east to Chesapeake Bay. It is tidal and navigable to Fredericksburg. The Rappahannock and the Rapidan were the scenes of some of the bloodiest battles of the war at Fredericksburg, Chancellorsville, and the Wilderness.

Rappe (Fr. râpé), a coarse kind of stuff. See TOBACCO.

Raperswy, on the north shore of the Lake of Zurich, has an old castle fitted up in 1869 by a Polish nobleman as a Polish National Museum; pop. 2900.

Raratonga. See COOK ISLANDS.

Ras (Heb. rosh), an Arabic word, signifying ‘head’, ‘promontory’, occurs in the names of many cape on the Arabian and North African coasts, and also in Sicily and Malta.

Rashes, affections of the skin, characterised by a red superficial efflorescence, diffused or in patches, disappearing under pressure, and usually ending in desquamation. To this division of cutaneous disorders belong Measles, Scarletina (or Scarlet Fever), erysipelis, erythema, roseola (or Infantile Rash) and Nettle Rash. It is a pity these rashes Measles, Scarletina, and erysipelis rather to be regarded as fevers or blood diseases than as cutaneous diseases in the true sense of the phrase.

Rashi (from the initials of Rabbi Shelomo Izaki, often erroneously called Jarchi), the greatest Jewish biblical exegete, was born about 1040, at Troyes, in France. Philosophy, medicine, astronomy, civil and ecclesiastical law, and exegesis were the chief branches of his learning; and to a rare proficiency in them he united a complete mastery over the whole range of Scripture. In the spirit of Rashi’s intellect further to perfect himself for his gigantic task he travelled for seven years, visiting the schools of Italy, Greece, Germany, Palestine, Egypt. His chief work is his Commentary on the whole of the Old Testament. Rashi’s style is extremely brief and concise, and often and passionately obscure and abstruse only to those who lack the necessary preliminary knowledge. According to the fashion of its day, it is replete with allegorical or rather poetical illustrations, gathered from the wide fields of the Midrash within and without the Talmud. This Commentary—entirely translated into Latin by Breithaupt, and partly also into German—was the first book ever printed in Hebrew (Reggio, 1474). Of his numerous other works may be mentioned his Commentary on the Babylonian Talmud; a Commentary to the Pirke Aboda; the Purades, an account of the origins of the Jewish Calendar; Legal Votes and Decisions; a Commentary on Midrash Rabbah; a Book of Medicine; and a Poem on the Unity of God. He died 13th July 1105; and such was his piety and his surpassing eminence that later generations wove a shining garland of legends around his head.

Rask, Rasmus Christian, philologist, was born at Brindekilde, near Odense, in the island of Funen, 22d November 1787, studied at Copenhagen, and in 1808 published his first work on the rules of the Icelandic language. During the years 1807-12 he occupied himself with drawing up grammatical systems of the Indo-European stock, Sanskrit, Slavonic, and Romance tongues, and in comparing them with those of India. He then visited Sweden, and in 1813 proceeded to Iceland, where he lived for three years. On his return to Copenhagen he was appointed sub-librarian to the university, and in 1818 published his splendid researches concerning the origin of the Icelandic language. After spending a year (1817) in Stockholm, where he published his admirable Anglo-Saxon grammar and the first critical edition of the Snorra Edda and the Eddie Saaemundar, he went to St. Petersburg, and there devoted himself to the study of all the oriental languages, principally Sanskrit, Persian, and Arabic, while at the same time he also acquired a competent knowledge of Russian and Finnish. Thus equipped, he proceeded to Astrakhan, and then commenced a journey through the country of the Turkmans and the Caucasins, Persia (adding meanwhile the Mongol and Manch exhibited to his already enormous linguistic acquisitions), and finally Ceylon, where he made himself acquainted with Singhalese and Pali, and wrote his Sinhalese Skryfinare (1822). In 1823 Rask returned to Copenhagen, laden with learning and rare manuscript treasures, of which the greatest part was presented to the university. In 1825 he was appointed professor of Literary History, in 1828 of Oriental Languages, and in 1831 of Icelandic. But his immense labours had exhausted his energies, and on 3rd, 14th January, 1831, at the early age of forty-five, a victim of hard work. Rask also wrote on Frisian grammar (1825), on ancient Egyptian chronology (1827), on Hebrew chronology (1828); grammars of several languages, and a great number of miscellaneous articles in the learned journals of the North, was the editor after his death, and published (3 vols. 1834-38). There are English editions of his Anglo-Saxon,
Danish, and Icelandic grammars. See the Lives by Petersen (1870) and Rönning (1887).

Raskolnik, the name of a variety of sects in the Russian Church. See Russia.

Raspail, François Vincent (1794-1878), a French chemist, doctor, and revolutionist, whose compulsion system (1845) was a forerunner of anti-soporifics. See a monograph on him by Saint-Martin (Paris, 1877).

Raspberry (Rubus Idaeus), the most valued of all the species of Rubus (q.v.). The characters of the leaves, flowers, and fruit of raspberry are well illustrated in the accompanying figure. The wild raspberry has scarlet fruit, and is found in thickets and woods throughout the whole of Europe and the north of Asia. It is common in Britain. The raspberry has long been in cultivation for its fruit. There are many cultivated varieties, with red, yellow, and white fruit, much exceeding the wild kind in size. The root is creeping, perennial; the stems only biennial, bearing fruit in the second year, woody, but with very large pith. Plantations of raspberries are most easily made by means of suckers. The raspberry loves a light rich soil, and is rather partial to a shady situation. The tall kinds are unsuitable in situations much exposed to winds, as the stems are easily broken. The rows are generally about 4 feet apart, the plants 3 to 4 feet apart in the rows. The young stems are thinned out to allow free access of air to those which are left. Stakes are often used to support the stems, or they are variously tied together. The fruit is used for dessert; for jams, jellies, &c.; for making or flavouring many kinds of sweetmeats; and, mixed with brandy, wine, or vinegar, for the preparation of Raspberry Syrup, Raspberry Vinegar, &c. Different preparations of it are used in medicine in cases of fever, inflammation, &c. Raspberry vinegar is a particularly grateful and cooling drink in fevers. Raspberries, fermented either alone or along with currants and cherries, yield a strong and very agreeable wine, from which a very powerful spirit can be made. Some of the other species of Rubus most resembling the raspberry produce also agreeable fruits. R. odoratus is a highly ornamental shrub, a native of Canada and the northern states of America, frequent in European and American gardens, but rarely produces fruit in Britain.

Raspe, J. E. See Munchausen.

Rassam, Hormuzd, Assyriologist, was born, the son of Chaldean Christian parents, at Mosul in Mesopotamia in 1826. He gained the friendship of Layard, and assisted him in his excavations at Nineveh in 1845-47 and 1849-51, and then succeeded him, until 1864, as British agent for conducting Assyrian explorations. His greatest success was the finding of the palace of Assur- bani-Pal (Sargon of Asshur), after holding in the following years political offices at Aden and Muscat, he was sent (1864) by the British government to Abyssinia, to demand the release of the Europeans kept in prison by King Theodore; but that potentate cast him into prison, and only released him with the rest of his captives after his army had been defeated by Sir R. Napier in 1868. From 1876 to 1882 Rassam was employed by the trustees of the British Museum in making explorations in Mesopotamia, and discovered Sepharvaim (Sippuwa) and Raschaspal. He wrote The British Mission to Theodore, King of Abyssinia (1869).

Rastatt, or RASTADT, a town and first-class fortress in Baden, stands on the Murz, 3 miles from its junction with the Rhine, and 15 miles SW. of Carlsruhe. Steel wares, beer, and tobacco are manufactured. From 1725 to 1771 the town was the residence of the Margraves of Baden-Baden. It is a fortification on an island in the Rhine, and of great strategic importance. It was captured by the French in 1794 and 1795, and held by the Austrians from 1803 to 1809. It was retaken by the French in 1813, and held by Austria in 1814. In 1840-48 by Austrian engineers to protect the northern entrance to the Black Forest. Rastatt is memorable for two congresses—the first in 1714, when a treaty of peace, which brought the war of the Spanish Succession to a close, was signed between the Emperor, Archduke Ferdinand, and Michael Eugene; and the second in 1797-99. On the breaking up of this latter congress without any definite result the three French plenipotentiaries set out for Strasburg; but they had scarcely got beyond the gates of Rastatt when they were attacked by Austrian horsemen, and two of the three slain, whilst the third was left for dead in a ditch. Their papers were carried off, but no further spoil was taken. It seems that the Archduke Charles gave orders to the horsemen to drive the French representatives out of Rastatt and take away their papers; the killing was the work of the officers, misunderstanding their orders. The town played a prominent part in 1849 as the stronghold of the revolutionists in Baden. Pop. (1890) 11,570.

Rat, a name applied to the larger species of the rodent genus Mus, but especially to the Brown Rat (M. musculus) and the Black Rat (M. rattus). Like the mice, which are included in the same genus, rats are agile and graceful animals, useful in burrowing, predominantly nocturnal. The bright eyes, large ears, naked muzzle, soft fur, and long scaly tail are familiar external characteristics. The brown or Norway rat measures about eight inches in length, not including the tail, which is usually shorter than the body. It is grayish-brown in colour, with flesh-coloured ears, feet, and tail. Black varieties sometimes occur. It is believed to have travelled gradually westwards, perhaps from China, and did not reach France or Britain till towards the middle of the last century. In 1727 it spread from Rouen to the Volga, and rapidly spread over Europe, dispossessing the black rat which had arrived some centuries before. According to some, the black rat was brought to Britain in 1732 in ships from the East Indies. As a common stowaway in ships, it has been distributed over the world, reaching America about 1775. The black rat is smaller and slimmer than the brown rat. The head and body measure six or seven inches in length; the tail is an inch or two longer. The head is more slender than in the brown rat, and the ears are rather larger. In most the colour is glossy black, but white and piebald varieties may occur. It is less fierce than the brown rat, and seems to be less distinctively a burrowing rodent, preferring the upper parts of houses to the cellars. Its original home seems to
have been in the East, perhaps in Persia, but it must have reached northern Europe by the 13th century at least, for its troublesome presence is noticed by Albertus Magnus.

These species of rat have similar habits, and the stronger, larger, and fiercer form sometimes tends to exterminate the other, this being one of the few instances which Darwin gives of his conclusion that the struggle for existence is keenest between closely allied species. As to the habits of rats, it is well known that they find their way everywhere; no door is shut to them; they gnaw and burrow through almost all obstacles. They run and leap, they climb and swim. They are fond of animal food, but will eat almost anything: corn, fodder, all kinds of human food, eggs, young birds, small mammals, all is their to their mull. In illustration of their voracity it is often related that in a slaughter-house near Paris thirty-five dead horses were picked to the bones in a single night. When pressed by hunger they display much boldness, and their skill in stealing even such unmanageable e.g. Nesokia, of which an East Indian species, the Bandicoot-rat (N. bandicota), may measure over a foot in length; Hapalopus, represented by little jerboa like animals in Australia; Echinosdrich, with one species in Celebes, a rat with a very long muzzle, and spines among the fur; Cricetomyx, represented by a formidable African species (C. gambianus) of large size and ferocious voracity. To some more remotely related rodents the term rat is often popularly applied—e.g. to the Water-vole (Arvicola amphibius; see VOLE), and to the American Musk-rat (Fiber zibethicus). See MOUSE, RODENTIA.

Similarly, the Black Rat (Mus rattus); Brown Rat (Mus decumanus).

goods as eggs is well known. Their senses, especially of smell and hearing, are acute, and their intelligence is well developed. The mothers are careful of their tender offspring, but the males display the reverse of parental affection. The albinos are delightful pets. Brewer cites several strange observations in regard to the so-called 'rat-kings,' which consist apparently of a number of diseased rats with entangled tails. It is said that over two dozen individuals have been found thus entangled. Rats are very prolific, breeding four or five times a year. Four to ten young are brought forth at a birth, after a very short gestation of about three weeks. Moreover, the young become sexually mature in about six months. All the conditions favour rapid increase, and plagues of rats by no means easy to cope with not frequently occur. Rats do much damage in various ways—by their burrows, by their voracious gnawing of all sorts of things, by their omnivorous appetite. They undermine walls, destroy woodwork, devour stores. When pressed with hunger they may attack large mammals, and even man himself sometimes falls a victim. They have been known to eat holes in fat pigs, to gnaw off the legs of birds, and even to destroy the soles of elephants' feet. Their destruction may in many cases be left to their natural enemies—birds of prey and carnivorous mammals—but it is often necessary to resort to the use of traps and poisons. One of the most effective ways of destroying them is to feed them with a mixture of meal and plaster of Paris. Their skin is sometimes used for making glove-leather; and their flesh, according to The Farmer's Friends and Foes, by Theodore Wood (1887), is, if similarly cooked, superior to rabbit.

There are several genera nearly related to Mus—

The Cape Ratel (Mellivora rotel).

Africa, and is said to feed much on bees and their honey, its thick fur protecting it against their stings; the other inhabits the north of India, prows about by night, is a voracious devourer of animal food, and often scratches up recently interred bodies from their graves. The Cape ratel is about the size of a badger, gray above, black below. It is easily tamed, and is amusingly active in confinement, continually running about its cage, and tumbling strange somersaults to attract the attention of spectators, from which it seems to derive great pleasure.
RATIONALISM

Rath, the Irish name for a prehistoric hill-fort. See HILL-FORTS.

Rathenow, a town of Prussia, on the right bank of the Havel (here crossed by a stone bridge), 48 miles by rail, and 29 by N. of Berlin. Optical glass, cut stones, woven wares, machin ery, bricks and tiles are made. Pop. (1885) 13,072; (1895) 18,418.

Rathkeale, a town of Ireland, on the river Deel, 19 miles SW. of Limerick by rail. Pop. 2549.

Rathlin, a crescent-shaped island off the coast of Antrim, 6½ miles N. of Ballycastle. Measuring 6½ by 1½ miles, and 3399 acres in area, it has fine cliffs, consists of columnar basalt and limestone, and offers notable points for sea-fishing. The volcanic soil in the valleys is fertile, but fishing is the leading industry, the kelp-manufacture being quite extinct. Rathlin is identified with the Rinia of Poltemy, Rinvia of Pliny, and Raghnin or Ragharin ("fortress of Ireland") of later writers. St. Columba established a church here in the 6th century; and Bruce in 1306 took refuge in a castle, now a ruin. Pop. (1841) 1039; (1891) 365.

Rathitor, a town of Prussian Silesia, stands on the left bank of the Oder, 44 miles SSE. of Oppeln. It is the chief town of the principality of Rathitor, which, a sovereign duchy from 1298 to 1532, has since 1713 been a part of the kingdom of Prussia. The town manufactures tobacco, shoes, paper, glass, sugar, furniture, &c., and has large ironworks. Pop. (1875) 17,269; (1890) 20,578.

Ratich, WOLFGANG (sometimes called RATKE or LATICHUS), educationist, was born at Holstein in 1571, based a new system of education on Bacon's philosophy, which he expounded to the German princes at Frankfort in 1612, and had an opportunity of putting into practice at Köthen in 1618, by favour of the prince of Anhalt. His principle was the realistic one of proceeding from things to names, and from the mother-tongue to the study of foreign ones. But he got into bad relations with the clergy and with his patron, and was actually imprisoned for eight months. A second chance given him at Magdeburg in 1620 ended also in failure, and after some years of indifferent wandering he died at Erfurt in 1635.

There are monographs on him by Krause (1872), Störl (1850), and H. Quens, Essays on Educational Reformers (1865; new ed. 1890).

Ratio. See PROPORTION, FLUXIONS.

Ration, in the British Army, is the allowance of provisions granted to each officer on service and in some colonies, and to each non-commissioned officer and soldier at all times unless on furlough or otherwise specially provided for. The ordinary ration is ½ lb. of meat, with 1 lb. of bread ("best seconds"), increased by ½ lb. of meat when in camp or abroad. Sometimes a grocery ration (tea or coffee, sugar, salt, &c.) is also issued, 1½ lb. being then deducted from the pay of the recipient. When men are not supplied with bread and meat rations an allowance of 6d. per diem is granted them. The bread ration may be increased during operations in the field, though not above 1½ lb. of bread or 1 lb. of biscuit, and the officer commanding may direct the issue in addition of wine, spirits, or any other article of subsistence equivalent thereto. The families of soldiers accompanying them abroad are allowed the following: the wife (married under regulations), half a ration; each legitimate child under fourteen, quarter ration. A ration of forage at home consists of 10 lb. of oats, 12 lb. of hay, 1 lb. of sweep (1 lb. of straw, 1 lb. of hay, and 2 lb. of oats is allowed in camp. Staff-officers and mounted officers of infantry provide their own forage except on active service, and are granted a pecuniary allowance of about 1s. 7d. (varying with the locality) per day to enable them to do so.

The full navy ration consists of the following articles: Daily—1½ lb. of ship-biscuit or 1 lb. of soft bread, ½ pint of spirit, 2 oz. sugar, 1 oz. chocolate, ½ oz. tea; 1 lb. fresh meat and ½ lb. of fresh vegetables, when these are procurable; otherwise, 1 lb. salt pork, or ½ pint split peas, or 1 lb. of sausages, with ½ pint of currants or raisins. On alternate salt-beef days—2 oz. preserved potatoes. Weekly—½ pint oatmeal, ½ oz. mustard, ½ oz. pepper, ½ pint vinegar. The sailor’s ration is issued free of any stoppage.

Rationalism, as a system of belief regulated by reason, might be expected to mean the opposite of irrationalism, but to cause belief into ignorance, and per impossimus, prejudice; and the growth of rationalism would then mean the progress of civilisation, the development of the intellectual and moral nature of men and nations. It is nearly in this sense that Lecky uses the word; attributing to its wholesome influence the decay of the belief in magic, witchcraft, and other hideous superstitions, and the substitution of a kindly tolerance in place of blind zeal for persecution.

But in ordinary English usage, general as well as theological, the connotation of the word is absence of religious belief. Lecky, therefore, used it as a term of reproach for those who, without utterly denying or attempting to overthrow the foundations of religion, make such concessions to the enemy as tend to subvert the faith; who admit the thin end of a wedge that pressed home will rend and destroy the fabric. They are relatively, mor passively, or blame worthily, on mere human reason instead of simply, frankly, and fully accepting the dicta of the divine word. An atheist would not be spoken of as a rationalist, nor would an irreligious, blaspheming freethinker. Rationalism is, in one or another of its features, nothing more than the main body of the orthodox; in especial those who think the 'law' view of inspiration, and minimise or explain away the miraculous details of the history of revelation and redemption. Rationalism is not so much a body of doctrine as a mood of mind, a tendency of thought shown in the attempt to apply to religious doctrine, the sacred story, and the sacred scriptures the same methods of research and proof as are used in mere human science and history, and the literatures of all times and peoples. This feature can be recognized, though with approval, by Lecky in his wider use of the word: 'Rationalism,' he says, 'leads men on all occasions to subordinate dogmatic theology to the dictates of reason and conscience. . . . It predisposes men in history to attribute all kinds of phenomena to natural rather than to miraculous causes; in theology to esteem succeeding religious systems the expression of the wants and aspirations of that religious sentiment which is implanted in man; and in ethics to regard as duties only those which conscience reveals to be such.' Rationalism, not being a system but a censor or drift of mind, has different aims at different times; just as 'liberalism' in politics was not the same thing before 1832 as it came to be after, or in 1832 what it was in 1867, 1885, or 1890. Opinions are held in serious and sober men by theological professors in 1891 without proving serious stumbling-blocks to the majority, which in 1860 would by all but a small minority have been regarded as distinctly rationalistic. Thus, till lately it was alarming rationalism to dispute the Mosaic authorship of Genesis, the Solomonic authorship of the Song of Songs, and the Davidic authorship of any of the Psalms; now the newer view is as many orthodox teachers. And in the last quarter of the 19th century scholars earnestly
support views which they themselves treated as highly dangerous twenty or thirty years earlier. Rationalism of this kind is a transition stage, but not necessarily a transition to unbelief.

The idea has been, and perhaps may be, traced in almost every age of the church’s history: no doubt the extreme representatives of the Petrine party in sub-apostolic times regarded Paul’s views as lax and rationalistic. If the Reformation was not rooted in rationalism (as to Catholics it seems to have been), many of the contentions of the reformers were such as all rationalists accept and sympathise with. Zwingli was a rationalist to Luther and the Lutherans; Socinus was of course a rationalist of an extreme type. The dry and language-neutralism, was the in the late 17th and 18th centuries fostered a rationalism as cold and un-spiritual. In the England of the 18th century, during the Deistic controversies, the Evangelicals of Germany thought, not altogether unjustly, that some of the most conspicuous opponents of the deists were not themselves free from the charge of rationalism; and the Evangelicals of Scotland regarded the ‘moderates’ of the 18th century, however orthodox in dogma, as thoroughly rationalistic in spirit. Rationalism is not so much opposed to orthodoxy as to mysticism, and what was called variously rationalism, enthusiasm, ‘lighting,’ and methodism. A soulless orthodoxy has not seldom been opposed by a fervent piety that by a not unnatural antithesis has tended to run into heretical extremes; while, on the other hand, actual rationalists have often been foremost amongst the champions of orthodoxy, and of revealed religion, against radical freethinking, deism, naturalism, and materialism.

In Germany the term rationalism is more definite in its reference than in England, but is not always used in quite the same sense. The two defective and mutually opposed schools of thought that Kant sought to supersede by his critical philosophy were, on the one hand, a shallow empiricism, and on the other a baseless and overweening metaphysical dogmatism or rationalism. Bacon also contrasted empirical philosophers with rationalists who spin theories out of their own bowels. Wolff presents the most conspicuous example of the philosophical rationalism which held that all is in heaven above and earth beneath could be ‘proved’ by pseudo-mathematical methods: and as God, responsibility, and immortality cannot be ‘proved,’ the whole of the doctrine of revealed religion. What in revelation could not be demonstrated according to this scheme was disallowed or explained away. Practical religion became in the Aufklärung a system of mere utilitarian morals.

It was paraphrased in a deeper view of man, history, and the universe; but his own explicit statements on positive religion were pronouncedly rationalistic: and the negative side of his philosophy was well calculated to lay the foundations of another school of theological rationalists (often called Deism), whose champions are Diderot, Voltaire (1759–1837), Breitknecht (1776–1844), and Wegscheider (1771–1849) may be taken as representatives.

De Wette (1780–1849) shows the transition to Schleiermacher, who (though in the English sense of the word he was an orthodox rationalist) converted the school of theologians and supernaturalists, founded a higher and truer religious philosophy, and heralded even the ‘piscopal theology’ of the mediation school.

But it was not in the sphere of speculation and dogma, but in that of biblical criticism, that German rationalism accomplished its main work, and that it left its deepest mark on the new theological development. In the early 18th century the ‘Germans in Greece’ were ready to seek, as English scholars thought: the Germans themselves admitted that in studying the Scriptures they failed to escape from dogmatic presuppositions, and that it was the English divines who approached the New Testament in a historical spirit, which in the Germany of that day caused misgivings. It is noteworthy that Semler (1725–91), ‘the father of rationalism,’ obtained the doctorate for a thesis written against Whistton, Bentley, andsemi-Rationalists, was that it was a laughing-stock. Strauss’s ‘mythical theory’ (excessively rationalist in the English sense of the term) was in its turn superseded by Baun (q.v.) and the new Tubingen school, whose epoch-making work marks the opening of the most recent period in scripture criticism. In the new criticism the rationalism of the older English point of view, the conviction that all truth is one, whether derived from the natural sciences, historical research, the dictates of conscience, or the records of divine revelation, and the willingness to accept what is apparently an unscientific spirit than the assumptions of a reckless sciolism: there is a false and a true rationalism; and it should be remembered that much that is now most surely believed by all has at one time or another been branded as rationalistic.

See the church histories; Tholuck, Vorlesungen über die Rationalismus und Geistesgeschichte des Aristotelismus (1865, unfinished), and earlier monographs by Staudlin and Rückert; H. J. Rose’s essay On the State of Religion in Protestant Germany (1825); and the Principles Inquiry into the Causes of the Rationalist Character of the Theology of Germany (1828–30); A. S. Farrar, Critical History of Free Thought (1862); R. W. Mackay, The Tubingen School and its Antecedents (1863); Locke, History of the Rationalists in Europe (1866); and the History of Rationalism (New York, 1866); Fisher, Faith and Rationalism (New York, 1879); Trollope’s Rational Theology (1872) and Movements of Religious Thought (1885); Draper, Intellectual Development of Europe (1877), and Conflict between Science and Religion (1874); Cairns, Unbelief in the Eighteenth Century (1881); Pfieler, The Development of Theology in Germany since Kant (1889).[1][2] The articles Rationalism, History, Reformation, Eirenism, Exegetics, and works there cited, with the articles on the chief rationalist critics and thinkers.

Ratisbon (Ger. REGensburg), a town of Bavaria, stands on the right bank of the Danube, 82 miles by rail NNE. of Munich. Formerly a town in the city of the empire and seat of the Diet, Ratisbon preserves its ancient marks, with narrow crooked streets, and high, many-corned, gabled houses. Among its churches the most
remarkable is the noble Gothic cathedral, begun in 1275, but not completed till 1534, and restored in the 19th century. The Church of St. James, formerly belonging to the Irish (Scoti) Benedictines, dates from the 12th century, and is built in the pure Byzantine style. The old town-hall was used for a century and a half (1645-1806) as the place of meeting for the imperial diet. At the Great Council, 1780, a motion was made by his son John of Austria. There are numerous interesting private dwellings, as the Thur and Taxis Palace, with library (40,000 vols.), picture-gallery, &c., the royal villa, and others. A stone bridge (1135-46), 1624 feet long, connects Ratibish with the island of Stadlin am Hof. The manufactures include porcelain and stoneware, brass and steel wares, leather, tobacco, lead-pencils, chemicals, &c.; and there is an active trade, especially in corn and salt. Pop. (1875) 31,487; (1890) 37,365. Originally a Celtic town, Radabanze (whence Ratibish), this place was made by the Romans a frontier fortress. Later it was the capital of the Duchies of Bavaria. Frederick II. declared it (1245) a free imperial city. During the 14th century it was the chief seat of the Indo- Levantine trade, and was one of the most populous cities of southern Germany. Here were signed the Ratisbon Interim (q.v.) in 1514 and the armistice between France and Austria in 1804. The city was stormed by Duke Bernard of Weimar in 1833, and by both the Austrians and the French in 1859 and led to Ratibish in 1881. See works by Weininger (7th ed. 1884) and Janner (3 vols. 1883-86).

Ratnagiri, a coast-town of India, 136 miles S. by E. of Bombay, with a port and sardine-fishery. Pop. 12,616. — The district has an area of 3922 sq. m. and a pop. (1891) of 1,105,926.

Rattan, a walking-stick made from the stem of a palm that is found in Sumatra. See PALM, p. 722.

Rattany. See RHATANY.

Rattazzi, Ubrano, an Italian statesman, was born at Alessandria, June 29, 1808. He studied law at Turin and practised as an advocate with great success at Casale. After the proclamation of the constitution in 1848 he was elected member of the Senate for Alessandria, and began his political career as a democrat. His eloquence and liberal principles raised him to the ministry; Gioberti made him minister of the Interior and later of Justice; but after the defeat of Novara he was obliged to retire along with the rest of the ministry. When Napoleon III. threatened the liberty of Piedmont, Cavour, Rattazzi, and their parties joined together to defeat his schemes, and in 1853 Rattazzi took the portfolio of Justice under Cavour, and presented the bill for the abolition of convents. Being accused of weakness in suppressing the Mazzinian movement in 1857, he retired from office early in the following year. In 1859, however, he was back again in office as minister of the Interior. The threatened secession of Savoy and Nice, which he opposed, led to his retirement in 1860. Having changed his views on this point, he was in March 1862entrusted with the formation of a new ministry, but had to resign at the end of the year in consequence of his opposition to Garibaldi; and once more prime-minister for six months in 1867, he lost the post for the same reason. He died at Frosinone, June 5, 1873. A want of sincerity was his chief drawback as a statesman.

His Speeches were edited by Scovazzi (8 vols. Rome, 1876-80). See A Life by Morelli (Padua, 1874), and Rattazzi et son Temps (Paris, 1881).

Rattlesnake (Crotalus), a genus of highly specialised venomous snakes, with a rattle of horny rings at the end of the tail. A long fang is borne on each maxilla, and is performed by a canal, down which the venomous secretion of a modified salivary gland flows when the rattle strikes. Behind each fang are several reserve fangs, which replace it after breakage — a not unfrequent result of the bite. There are about fifteen species, exclusively American. Of these the Banded Rattlesnake (C. horridus) is abundantly distributed from Maine to Arizona, C. molossus (Mexico and Arizona), C. lueher (California and other western regions), the Diamond Rattler — C. aduananteus (California and Mexico), the Horned Rattler — C. cerastes (California, Arizona, and Mexico).

Rattlesnakes are naturally sluggish and prefer defensive to offensive tactics, except when on the track of their natural prey — rabbits, rats, squirrels, and other small mammals. Not a few ideas about rattlesnakes must be dismissed as false: they do not fascinate or charm mammals or birds, though these may be overcome by an almost paralyzing fear; the rattling does not lure prey nor attract mates, but is rather a reflex expression of excitement, apparently warning off molesters on whom the snake is doubtless unwilling to expend energy in the exhausting act of striking; finally, the number of rings does not necessarily indicate the age of the animal, though new rings seem to be added at successive sloughings. Rattlesnakes are generally nocturnal. The young are brought forth alive. The poison is very deadly, rapidly paralysing the nerve-centres and affecting the respiratory and circulatory functions. When a man is bitten it is customary to ligature above the wound, to suck out the poison, to use stimulants freely, and to inject antidotes such as permanganate of potash. Often, however, the result of the bite is fatal (see SNAKES).

Rattray, a police brough of Perthshire, on the Erich, opposite Blairgowrie. Pop. 2227.

Rauch, Christian Daniel, sculptor, was born at Aroden, in Waldeck, 21st January 1777. In 1797 he became valet to Frederick-William III., king of Prussia, but, resolving to devote himself to art, was enabled by the generosity of a nobleman to study at Rome, where he enjoyed the friendship of Thorwaldsen, Canova, and Wilhelmine von Humboldt, the Prussian minister. In 1811 he was called by the king of Prussia to Berlin to execute the monumental statue of Queen Louisa now at Charlottenburg. Rauch was not, however, quite satisfied with this triumph of his art, but commenced a new statue of the queen, which he finished eleven years afterwards, a masterpiece of sculpture, now in the palace of Sans Souci. After this he lived principally at Berlin, but occasionally visited Rome, Carrara, and Munich. He laboured indefatigably
in his profession, and by 1824 had executed seventy busts in marble, of which twenty were of colossal size. His works include two colossal bronze statues of Field-marshal Blücher (1827), a horseman, by Johann Heinrich Wieber (1808-81) at Horn, near Hamburg, in connection with the German Home Mission (Internere Mission). It is partly a refuge for morally neglectable children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, &c., in promotion of the objects of the Home Mission. It was opened on November 1, 1831, by Wieber with twelve neglected children. By the addition of new houses the whole has, however, become very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinders' shop, and book-selling form part of the institution. The children live in families of twelve, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor manual labour. In connection with the Raueh Haus there has been founded in 1845 a kind of conventual institute for the education of young men as heads or superintendents of similar institutions. See works on the subject by Wieber (1835-39).

Rauh's Haus ("the Rough House," so called) is the name of a great institution founded and managed by Johann Heinrich Wieber (1808-81) at Horn, near Hamburg, in connection with the German Home Mission (Internere Mission). It is partly a refuge for morally neglectable children; partly a boarding-school for the moral and intellectual education of children of the higher classes; lastly, a training-school for those who wish to become teachers or officials in houses of correction, hospitals, &c., in promotion of the objects of the Home Mission. It was opened on November 1, 1831, by Wieber with twelve neglected children. By the addition of new houses the whole has, however, become very much enlarged, and has of late almost grown into a colony. A printing-office, a bookbinders' shop, and book-selling form part of the institution. The children live in families of twelve, each family being under the paternal superintendence of a young artisan, who employs the children according to their capabilities, partly in indoor, partly in outdoor manual labour. In connection with the Raueh Haus there has been founded in 1845 a kind of conventual institute for the education of young men as heads or superintendents of similar institutions. See works on the subject by Wieber (1835-39).

Rauh, Friedrich Ludwig Georg von, German historian, was born at Wörlitz, near Dessau, in the duchy of Anhalt, on 14th May 1781, studied law at Halle and Göttingen, and entered the Prussian state service in 1801. In 1811 he accepted the chair of History and Politics at Breslau; in 1819 he was called to fill the similar chair at Berlin. He was for some time secretary of the Berlin Academy. In 1848 he was sent to Paris as ambassador of the German parliament. He died on 14th June 1873. The first scientific historian to popularise history in German, Von Raueh was the author of "Geschichte der deutschen Staaten bis auf die Gegenwart" (24 vols. 1825-35), his best book, based on critical research, and agreeably written; "Geschichte Europas seit dem Ende des 15. Jahrhunderts" (8 vols. 1832-50); "Beiträge zur neueren Geschichte" (5 vols. 1836-39); and edited the useful "Historisches Taschenbuch" from 1830. In the years 1830-43 he made extensive journeys, going as far as the United States; the observations made during these trips were written in several books dealing with England (1830 and 1841), Italy (1840), the United States (1845), &c. See his Lebenserinnerungen und Briefe (2 vols. 1861).

Rauer, Karl Georg von, geologist and geographer, a brother of the preceding, was born April 9, 1783, at Wörlitz, studied at Göttingen and Halle, and at the Mining Academy at Freiberg, was appointed professor of Mineralogy at Breslau in 1811, was translated in 1819 to Halle, and finally, in 1827, was appointed professor of Mineralogy and Natural History at Erlangen, where he died June 2, 1865. His most ambitious book was "Geschichte der Pudagogik" (1843-51; 5th ed. 1878-80), a portion of which was issued separately as "Die Erziehung der Mädchen" (4th ed. 1886). His most popular books were: "Handbuch der Erdbeobachtung" (6th ed. 1866); "Palästina" (4th ed. 1860); and "Lehrbuch der allgemeinen Geographie" (1852; 3d ed. 1848). He also wrote books more immediately connected with his special study, as "Geognostische Fragmente" (1811), "Versuch eines ABC-Buchs der Kristallkunde" (1820-21), &c. See his Autobiographie (1825).—His son, Rudolf von Raueh (1815-76), from 1846 a professor at Erlangen, won a high reputation in the field of Teutonic philology.

Ravalliac, François (1578-1610), a bankrupt schoolmaster, who, after long imprisonment and a brief service in the Order of Fontaines, was moved by fanaticism to stab Henry IV. (q.v.) of France. He was torn asunder by horses. See Loiselier, "Ravalliac et ses Complices" (1873).

Ravelin. See Fortification.

Raven (Corvus cornix), a species of Crow (q.v.), now somewhat rare in Britain except in remote regions or on rocky islands. It is, however, widely distributed in Europe, northern Asia, and North America. The plumage is glossy black, with a purplish-blue lustre on some parts. The bill and legs are also black. In length the raven measures about two feet. The males are rather larger and more lustrous than the females. Very early in the year the bulky nest is built on a cliff or tree; the three to five eggs are blueish-green, with brownish spots. The raven's note tends to be harsh, but is refined at the pairing season, and the bird may be trained to parrot-like imitation with remarkable success. The flight is powerful, and the bird often soars high. On small mammals, such as rats, the raven is fond of feeding, and its attacks on game and even lambs have led to its extermination in many districts. In Scandinavia the raven was sacred to Odin, but in many countries it is a bird of ill omen. Instances are on record of ravens which lived for four-score years, and there is no doubt that its natural longevity is great. Three varieties or subspecies of the raven are recognised in North America. See Crow; and R. W. Schmudt, "The Mythology of the Raven" (1890).

Ravenna, a city of Italy, 43 miles E. of Bologna, once close to, but now some 5 miles from the Adriatic, with which it is connected by the Consini Canal, is enclosed by a wall 3 miles long, with five gates. It has been the seat of an archbishop since 438, and possesses a museum, a public library, a picture-gallery, municipal buildings (with a leaning tower), a theatre, &c. It has manufactures of silk, linen, paper, and glass, and a trade in wine and agricultural products. The streets are wide, and the squares are adorned with statues of the popes. The outward aspect of the
town and its buildings is dull and disappointing, but the interiors of the churches are exceedingly interesting. Pop. 12,100; of commune, 60,573.

Possibly a Thessalian settlement, afterwards held by the Umbrians, Ravenna passed to Rome as one of the cities of Cisalpine Gaul south of the Po. It first became famous under Augustus as the site of the famous Roman baths. The Classical flowering suburb—as its port, a site marked now only by a church, and separated from the sea by the pine forest celebrated by Dante, Boccaccio, Dryden, and Byron. Deserted by the sea, and strongly entrenched by canals and marshes, Ravenna became the refuge of the Emperor Honorius (402), and the capital of Italy for the next 350 years. Imperial until Romanus Augustulus dethroned the purple at the bidding of Odovacar (see ITALY), who ruled at Ravenna 476–493, it attained its greatest glory under Theodoric the Ostrogoth (493–526), and afterwards by the Franks, by whom it was gifted to the pope. It was the religious and early part of the 13th century, governed by its own dukes in the 14th, subject to Venice after 1440, it was won by Pope Julius II in 1509, and continued papal until it became national in 1860.

Ravenna, which on account of its numerous ancient churches, holds a unique position as 'the Pompeii of the 5th and 6th centuries'—that marked transitional period in early medieval history. There are at least six churches of the time of Galla Placidia (350–450), the sister of Honorius and nun. After the death of her husband, III Vizala, her brother, is her mausoleum, and there lie her brother, her second husband Constantius III, and her son, Theodoric, leaving, with rare religious toleration, the cathedral of St Urso (almost entirely rebuilt, 1754) and the other churches to the Catholics, erected for his Abu in whose mausoleum (La Martin) (now St Apollinare Nuovo, with its marvelous mosaic processions of martyrs added about 500, when it was 'reconciled') as a cathedral, a baptistery (now St Maria in Cosmedin), and St Teodor (now St Spirito). St Vitale (with contemporary portraits in mosaic of the emperor and Theodoric)—the model for Charlemagne's cathedral at Aix-la-Chapelle—and the magnificent basilica of St Apollinare in Classe belong to the age of Justinian. The round campaniles, perhaps of the 10th century, form another architectural feature peculiar to Ravenna.

Dante died at Ravenna, September 14, 1291, and is buried there. A column, 2 miles from the walls, commemorates the fall of Gaston de Foix at the head of the French army of Louis XII., after a bloody and useless victory over the papal and Spanish troops, April 11, 1512. Byron revisited at Ravenna from June 1819 to October 1821.

**Ravensburg.** A town of Württemberg, 11 miles by rail NE. of Friedrichshafen, on Lake Constance. Pop. (1890) 12,287.

**Raveseoff, Thomas** (1592–1640), musical composer and author of Metempsichta (1611), and of a collection of songs with four voices, The Whole Book of Psalms (1621) by which he is famous. Some of the tunes, such as St David's, Canterbury, Bangor, and many others, which have since become popular, are by Ravenesoff himself.

**Ravenspur.** See Humber.

**Ravignan, Gustave François Xavier Delacroix de,** a celebrated Jesuit preacher, was born at Bayonne, December 2, 1736, was professor at Montmoreau, and became famous in 1837 as preacher at Notre-Dame in Paris. He died 20th February 1858. He published an Apology of his order in 1844, and in 1854 a more lengthened work with the same view, Clement XIII. et Clement XIV. See memoirs by Ponjoulot (1858) and De Ponleroy (1860; Eng. trans. New York, 1873).

**Ravindra.** See Traveller's Tree.

**Rawal Pindi,** a town and important military station of the Punjab, lies between the rivers Indus and Jhelum, 160 miles by rail NW. of Lahore. It became the principal city of the Punjab in 1844, and since the last Afghan war, the town has increased at a rapid rate. Pop. (1868) 28,586; (1881) 59,980; (1891) 73,460. There are an arsenal (1883), a fort, a fine public park, several European churches, including the garrison church, in which Bishop Maxwell (1865–1885) was rector. Rawalpindi (1883), a fort, a fine public park, several European churches, including the garrison church, in which Bishop Maxwell (1865–1885) was rector. Rawalpindi has an area of 15,435 sq. m. and a pop. of 2,150,568.

**Rawitsch,** a town of Prussia, 64 miles by rail S. of Pozen. Pop. 12,919.

**Rawlinson, Sir Henry Creswicke,** Bart., orientalist and diplomatist, was born at Chaldon- ton in Oxonshire, 11th April 1810, and entered the East India Company's army in 1827. In 1833 he proceeded to Persia to assist in organising the Persian army. During the 1840's he was in India. In that country he began to study the cuneiform inscriptions, and made a translation of Darius' famous Medes and Persians inscription, which he published in the Journal of the Royal Asiatic Society. After he left Persia he held command of Kandahar during the troubles times of 1840–42 (see Afghanistan); he was appointed political agent at Bagdad in 1844, and consul-general there in 1851. He showed great bravery in the field, and remarkable skill and resource in diplomacy. In 1855, now made K.C.B., he was appointed political agent in Persia. He died at Shire in 1858, and was buried at Kandahar. In 1858–59 he was again in Persia as British minister; and was successively member (1868) and vice-president (1876) of the Council of India. In 1865–68 he sat in parliament for Frome. He held the presidency of the Royal Geographical Society (1871), to which he contributed valuable papers, a trusteeship of the British Museum (1870), and a directorship of the Royal Asiatic Society. He was made a baronet in 1891; and he died 6th March 1895. The 'father of Assyriology,' he wrote A Commentary on the Cuneiform Inscriptions of Babylonia and Assyria (1857), The History of Assyria (1822), The Cuneiform Inscriptions of Western Asia (with Norris and George Smith, 5 vols. 1861–70), and England and Russia (2d ed. 1875). See the Life by his brother (1868).

That brother, REV. GEORGE RAWLINSON, orientalist and historian, was born at Chaldonhinton in Oxonshire in 1812, took a first-class in classics from Trinity College, Oxford, in 1838, and was elected a Fellow of Exeter College in 1840. In 1839 he preached as Hampton Lecturer on Historical Evidence of the Truth of the Scripture Records, and two years later was chosen Camden professor of Ancient History. In 1872 he was made a canon of Canterbury. His historical publications cover nearly the entire history of the ancient Orient. The series opens with the standard edition of Herodotus (4 vols. 1838–60; 6d ed. 1876), which was
followed by The Five Great Monarchies of the Ancient Eastern World (4 vols. 1862-67), The Sixth Great Oriental Monarchy of Parthia (1874), The Seventh Eastern Monarchy: History of Ancient Egypt (1881), and History of Phenicia (1889). The same ground is also covered in part in the smaller popular works, Egypt and Babylon from Scripture and Profane Sources (1884), Manual of Ancient History (1883), Religions of the Ancient World (1882), etc. In addition to these, he has written several volumes of biblical exposition and religious criticism, as Contrasts of Christianity with the Hebrew and Jewish Systems (1861), a series of sermons preached before the university of Oxford; Esther, Ezra, Nehemiah, &c., for The Speaker's Corner with an appendix (1881 and 1885); Moses, His Life and Times (1887); Kings of Israel and Judah (1889); Isaac and Jacob (1890); brief essays contributed to Present Day Tracts; and the article PHENICIA in the present work.

Rawmarsh, a town in the West Riding of Yorkshire, 2 1/2 miles N. of E. of Rotherham, with china and iron works, and neighbouring collieries. Pop. 2,171 (1881), 2,188 (1890).

Ray, a popular name applied to many of the flat cartilaginous fishes or Elasmobranchs. Skate (Raja batis), Thornbacked (R. clavata), Electric Rays (Torpedo), Sting-rays (e.g. Trygon), Eagle-rays (e.g. Myliobatis) are representative. They lead a somewhat sedentary life at the bottom of the sea, moving sluggishly by undulations of the pectoral fins which form a large part of the flat body. They are all carnivorous. The true rays, of which skate and thornback are typical and very common species, form the family Rajidae. Many attain a large size, sometimes measuring six feet across. The flesh is flavoured and strongly esteemed. See CARTILAGINOUS FISHES, DEVIL-FISH, ELECTRIC FISHES, SKATE.

Ray, or Wray, JOHN, naturalist, was born at Black-Notley, near Braintree, in Essex, 29th November 1628. From Braintree free-school he went up to Cambridge, where he was fellow, Greek lecturer, mathematical tutor, and junior deane in Trinity College, but after a time began to devote himself entirely to the study of natural history. At the Restoration he accepted Episcopal ordination, but was ejected by the 'Black Bartholomew' (1662). Thereupon, accompanied by a kindred spirit, Francis Willughby, a friend and former pupil of his own, Ray travelled over most of the United Kingdom, collecting and investigating botanical and zoological specimens; and in 1663 they started on a tour through the Low Countries, Germany, Italy, and France, with a similar object, Willughby taking the zoology under his charge, and Ray the botany. In 1667 Ray was elected a Fellow of the Royal Society, to whose Transactions he occasionally contributed valuable papers. In 1672 his friend Willughby died, leaving him guardian to his two sons. After several changes of residence, in 1679 Ray settled down in his native village, where he died, 17th January 1705. As a botanist and zoologist he ranks very high, the classification of plants which he proposed being practically in the main the foundation of what is now known as the 'Natural System' of classification (see BOTANY). Ray's zoological work is considered by Cuvier as the foundation of modern zoology. The chief of his works on botany are Methodus Plantarum Nova (1682); Catalogus Plantarum Anglice (1670), the basis of all the subsequent floras of Britain; and Historia Plantarum (3 vols. 1689-1703). His zoological works include the Synopsis Methodicæ Animalium (1693) and three posthumous volumes on Birds, Fishes, and Insects, published by Dr Derham. He was also the author of some theological works. His friend Willughby, having collected the materials for an extensive work on the animal kingdom, left to Ray the task of arranging and classifying them (see WILLUGHBY). See Memorials of Ray (1846), and his Correspondence (1848), both edited by Dr E. Lancaster for the Ray Society, which was founded in 1844.

Rayahs, the Christian peasantry, labourers, and small farmers, who lived under Turkish rule, or rather misuse, in the Balkan peninsula. The word means 'cattle,' and as cattle these people were treated by their Turkish masters in Bosnia, Servia, Bulgaria, and the neighbouring states.

Rayleigh, LORD, physicist. John-William Strutt, third Baron Rayleigh, was born 12th November 1812, studied at Trinity College, Cambridge, and was the senior wrangler (1835), Smith's prizeman, and fellow of his college (1866). He was professor of Experimental Physics at Cambridge from 1879 to 1884; in 1888 succeeded Tyndall as professor of Natural Philosophy at the Royal Institution; and is D.C.L., LL.D., and F.R.S. He has contributed much to the scientific periodicals, edited Clerk-Maxwell's Heat, and is author of The Theory of Sound (1877–78). In 1894, with Professor Ramsay, he separated from atmospheric nitrogen the new gas argon—bitherto undetected, but constituting about 1 per cent. of the atmosphere.

Rayonard, FRANÇOIS JUSTE MARIE, poet and philologist, was born at Brignolles, 18th September 1761, studied at Aix, and in 1791, an advocate and a deputy, joined the Girondins, and was for a time imprisoned. His poems and tragedies were successful, and in 1807 he was elected to the Academy, of which he became perpetual secretary in 1817. A member of the imperial legislative body from 1806, he continued to produce dramas, but towards the fall of the Empire turned his attention to linguistic and particularly Provençal studies. His researches into the origin and transformations of this tongue led to many valuable discoveries, though his theories as to the relation of the language of the troubadours to the other Romance tongues are not now accepted. Rayonard died at Passy, near Paris, 27th October 1836.

His chief writings are Éléments de la Grammaire Romane (1816); Choix de Poésies Originales des Troubadours (6 vols. 1816-21); Grammaire comparée des Langues de l'Europe Latine dans leur Rapports avec la Langue des Troubadours (1821); and Lexique Romane, ou Dictionnaire de la Langue des Troubadours (6 vols. 1835-44).

Razor. See BEARD, CUTLERY.

Razor-bill, or RAZOR-BILLED AUK (Alca torda), a species of Auk (q.v.), very common on
the coasts of Britain and of all the northern parts of the Atlantic Ocean. In March and April they congregate in great numbers on cliffs and islands for the breeding season. A single egg, measuring about 3 inches in length, and of a white or light brown colour streaked with dark brown, is laid in a crevice or under a ledge of rock. The male helps to sit on the eggs. The razor-bill measures about 17 inches. The plumage is of a glossy greenish black on the upper parts and dazzling white underneath. It is a handsomer bird than the Guillemot (p. v.), and can be readily distinguished from it at a distance by its upturned tail. The flesh of the razor-bill is used for food, and the eggs are esteemed a delicacy. They are less easily obtained than those of the guillemot, being usually laid in concealed situations.

Razor-fish, or Razor-shell (Solen), a genus of bivalves of which the common British species *S. obliquus* and *S. maura* are familiar examples. The shell is remarkably elongated, and gaps at both ends, the siphons are short, the foot is large and powerful. The species are numerous, and inhabit the sands of all seas except in the coldest parts of the world. Some of the tropical species have shells of great beauty. The solens burrow in sand, making vertical holes 2 or 3 feet in depth, and ascending and descending by means of their foot, which is capable of being contracted to bore a passage for the animal, and to drag it through. They are used for food, and also by fishermen for bait. To obtain them, a hooked iron instrument is used. Another method is to drop a quantity of salt on the mouth of the hole, which causes them to come up, when they are quickly seized.

Ré, Ile de (*Exe insula*), is a small, low-lying island off the coast of the French department of Charente-Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton. It is about 18 miles long and 3 broad, measures 28 sq. m., and has about 16,000 inhabitants, who are chiefly engaged in the preparation of salt (32,000 tons annually). The west coast is rocky; on the east side there are some good harbours. Oyster-farming has of late become an important branch of industry (35,000,000 annually). Wine is made, and Bordeaux town, St. Martin (pop. 2789), was fortified by Vauban. Ars and La Flotte have each about 2000 inhabitants.

Reade, Charles, novelist and playwright, was born at Ipsden House on 8th June 1814. The youngest of eleven, he came on both sides of good lineage, his father an Oxfordshire squire, his mother a clever Evangelist, from her he inherited his dramatic instinct. After five years (all haggling) at Illey, and six under two other and milder private tutors, in 1831 he gained a demyship at Magdalen College, Oxford, and in 1833, having taken a second class in honours, was duly elected to a lay readship. Next year he entered at Lincoln's Inn, and in 1834 was called to the bar, meanwhile having made the first of many tours abroad and at home, and developed a craze for trading in violins. 'I studied,' he tells us, 'the great art of Fiction for fifteen years before I presumed to write a line of it;' and it was not till 1850 that he put pen seriously to paper, 'writing first for the stage—about thirteen dramas, which no-thing of a body would take. Through all this, however, he formed his platonic friendship with Mrs Seymour, a warm-hearted actress, who from 1854 till her death in 1879 kept house for him. She animated, counselled, guided him; and, apart from his comedies and sketches (which were many), his life after 1852 is little except a record of the production of plays and novels, by the former of which he generally lost money, by the latter won profit and fame. The plays include *Masks and Faces* (1852), written in conjunction with Tom Taylor, and having Peg Woffington for its leading character; *Gold* (1853), the gorm, and *Sera Nu- quam* (1865), the dramatised form, of *Never too Late; and Drink* (1879), an adaptation of Zola's *L'Assommoir*. Of his eighteen novels may be mentioned *Peg Woffington* (1853); *Christie John- stone* (1854), a very whaven fission hase; *It Is Never too Late to Mend* (1856), a tale of prison abuses and life in Australia; *The Cloister and the Hearth* (1861), his hero Erasmus' father, condemned, like Reade himself, to celibacy; *Hard Cash* (1863), against private lunatic asylums; *Griffith Gaunt, or Jealousy of the Dolphin and Plane* (1865), with Dion Boucicaut, against ship-breaking; *Put Yourself in his Place* (1870), against trades-unions; *A Terrible Temptation* (1871); and *A Woman- kater* (1877), for woman's rights. His last years clouded by sorrow and ill-health, he died at Shep- herd's Bush on Saturday, 11th April 1884, and was buried in Willesden churchyard beside his 'beloved friend.'

Charles Reade was not one of the greatest novelists of the century (who number three, at most four); but of the second order he is perhaps the best. He is sometimes coarse, sometimes very dull, occasionally more than rather than dramatic, and sometimes even dull, weighed down with authorities—the blue-books, books of travel, and the like, with which he fettered his imagination. With the greatest novelists one is conscious only of the story, with him one is conscious with the story; some tone or mannerism from time to time jars upon us. And yet what a story-teller it is. How he carries us with him, stirs us, saddens, gladdens, terrifies, delights. No novels are better than his to read aloud. For they hold the listeners spell- ing in which no other tale of adventure a so stirring and incident so inexhaustible can pretend to
moment's comparison with it—unless we are foolish enough to risk a reference to the many who, without any knowledge, untrained, and even for verse or prose for verse, than does that of Shakespeare's greatest contemporary by the name of Shakespeare.

Charles Reade: A Memoir (2 vols. 1857), by his brother and a nephew, is a most unhappy piece of biograph. The Gentleman's Magazine for 1852 contains two important articles by Sir W. Benett and 'Ouida'; and in his Miscellanea. (1836) is Mr Swinburne's article from the Nineteenth Century. Readmonds (1852) is a collection of the novels fragments and Essays from his work, with an introduction by Mrs Ireland, appeared in 1851.

Reader. See LAY-READER.

Reading. a municipal, parliamentary, and county borough, the capital of Berkshire, on the Kennet, near its influx to the Thames, 36 miles by rail W. of London (by road 39, by river 74). Its strong castle was wholly demolished by Henry II.; and the splendid Benedictine abbey, founded in 1121 by Henry L., who was buried here, is represented by considerable ruins and a fine gateway, restored in 1861, and surrounded by public gardens. Nine parliaments were held within its hall; and the last of its mitred abbots was changed by Henry VIII., and it was part of the church, before the Reformation. There are handsome modern buildings and two excellent town-halls, a lofty clock-tower, a free library, concert-room, museum, &c. Other buildings are the Italian asise courts (1861); a large grammar-school (1486; rebuilt 1870-71), of which Dr Valpy was long head-master; St. Lawrence's Church (1434; restored 1860) and the Royal Berkshire Hospital. University Extension (Oxford) College, opened in 1898, has accommodation for six hundred students; and the largest (59 acres) of three public parks was gifted in 1891 by Mr G. Palmer. Reading is an important industrial centre and agricultur produce, and has manufactures of iron, paper, sauce, &c., whilst two of its industrial establishments are world-famous—Huntley and Palmer's huge biscuit-factory and Sutton's seed-emulsion. Reading, which is in the diocese of Oxford, gives its suffragan bishop. Its representation was reduced from two to one in 1855, when, however, the parliamentary borough was extended. The first charter was granted by Edward III. Pop. (1851) 24,456; (1881) 46,064; (1891) 55,732; county borough (1891) 60,034. Reading suffered much loss by the Danes in 885, and in 1043 surrendered to Essex after a ten-days' siege. It was the birthplace of Archibald Land, Justices Talford, and Goldwin Smith, but not of Miss Edgeworth, who is often claimed as a native. It has memories also of Chaucer and Bunyan.

See works by Coster (1802-9), Man (1816), Doran (1835), and J. J. Jones (1857).

Reading, a city of Pennsylvania, capital of Berks county, on the left bank of the Schuylkill River, 58 miles by rail NW. of Philadelphia. It is pleasantly situated on an ascending plain, and from the neighbouring hills draws its water supply. and abundant iron ore. The principal manufactures of Reading are its iron and steel works. These include many rolling-mills, forges, foundries, furnaces, machine-shops, nail-works, &c. It has also manufactories of shoes, hats, beer, cigars, leather, paper, bricks, &c. Settled in 1748, it became the seat of the diocese in 1819, and is that of an Episcopal bishop. Many of the inhabitants are of German descent, and half the newspapers are in that language. Pop. (1800) 58,601; (1900) 78,961.

Reading, a town of Massachusetts, 12 miles by rail N. by W. of Boston, with boot and shoe and furniture factories. Pop. (1800) 4989.

Realism. See Induction.

Realty. A silver coin and money of account in Spain, Mexico, and other old Spanish possessions, is the 24th part of the piastre, or 4th of the peseta, the name of the new Spanish decimal system, and has a value, varying with the exchange, of about 25d. The real was first coined in Spain in 1497. It is also the 24th part of age in Portugal, equal to the equivalent of 40 reis. In Java it is the name of a weight for gold and silver articles, corresponding to 17 dwt. 14 gr. troy weight.

Real is a term used by lawyers to describe the nature of certain rights and actions. The rights of an owner of property are real rights, i.e., he has a right to sue and to recover specified things or services against all other persons. Contractual rights, on the other hand, are personal—i.e., they are good only against the person who is bound to perform the contract. Forms of action are classified according to the nature of the right which is in dispute. The Roman law gave special names for the recovery of any thing, whether movable or immovable, which was withheld from the person entitled; an action in persona was the form in which compensation could be obtained for breach of contract or other wrongful act. In Scotland, there is another category, where the interest of the owner has been studied and followed, real rights and real actions are defined very much as they were defined by the civilians; England has taken a course of its own. At the time when the common law was taking shape land was of primary importance. The owner of chattels (movable things) was entitled to damages if his property was detained from him or converted to the use of another; but he had no real action to recover the thing itself. A real action was an action to recover land or some right connected with land. Some interests (e.g., the right of a tenant under a lease) were regarded as personal rights against the owner; in technical language the interest of a tenant for years is a chattel real, or a chattel which savours of the reality. The English law of property frames all its rules with reference to these distinctions

Realgar. See ARSENIC.

Realism in philosophy is diametrically opposed to Nominalism, as involving the belief that given and specific real things, existing independently of our conceptions and their expression, and that these are alike actually the object of our thoughts when we make use of the terms. Again, as opposed to Idealism, the word implies an intuitive cognition of the external object, instead of merely a mediate and representational knowledge of it. In art and literature the word Realism or Naturalism is employed to describe a method of representation without idealisation, which in our day in France has been raised to a system and claims a monopoly of truth in its artistic treatment of the facts of the material world and life. It claims that the enthusiasm and exaggerations of romanticism must give place to a period of reflection and criticism; that we must not select from the facts put before our eyes, but merely register them and the sensations they engender for themselves alone, apart
from all considerations of mere beauty, to say nothing of religion or morality; and that the experimental romance must hereafter follow the right course, the creation of man, and not on 'human documents' supplied from the close observation of the present, or from laborious erudition—the retrospective observation of the past. As a gospel this militant Realism is the offspring of the Positive philosophy and the physiology and the social science, and in the hands of its apostles, it has become a new morality which reforms not by precept but example, not by the attraction of the good, but by the repulsion of the evil. The practical result is that for French realists there is in the moral world only the evil, in the visible world only the ugly; and the triumphs of our modern fiction are the pitiless impersonality of Madame Bovary, the cold splendours of Salammbô, the brutal vulgarities of Zola, the refined sensuality of Bourget and Guy de Maupassant, the pretentious inanity of the Goncourt brothers, and the dreary pessimism of Dostoevsky and Tolstoi. If realism were perfect it would include all reality, order as well as disorder, the general as well as the particular, the lofty as well as the low. For there are men and women who are neither selfish nor drunken, nor heartless, nor heart-rending; but if your Paris is not the universe; your hospital-wards may contain cases of all moral maladies, but you forget the moving world of health and life outside its walls; your vaunted collection lacks one speci- men, not the rarest, and certainly the loveliest. For the dream is as true a leaf of life as the sober vision, and idealism is the permanent revenge of man over the inequalities of life—the protest of creative mind against external fatality. Idealistic art seizes life at its richest moments, and presents it preserved for ever by its immediate likeness and constancy and degradation. This so-called realism is not reality—the steps of true art must ever be elimination and generalisation; its postulates, the eternal conventions of form, style, language, and subject, necessary because they are elemental.

Real Presence. See Lord's Supper, Transubstantiation.

Reaping. The act of cutting corn, was from ancient times until about the 18th century performed with an instrument called a reaping-hook or sickle. The sickle in use among the ancient Jews, Egyptians, and Chinese appear to have differed very little in form from those employed in Great Britain. The reaping-hook is a curved instrument of about a foot and a half in length, tapering from a breadth of about two inches at the butt-end, where it is fixed into a wooden handle. The edge is sometimes serrated; but, as a rule, it has long been made plain and sharp like a knife. In many parts of the British Isles it was sup- pressed by the custom of paying by the acre in the 19th century. In other parts it lived until the modern reaping-machine was ready to take the place of it as well as of the scythe. The sickle or hook did its work admirably, but it was necessarily slow. On small farms in some districts it is still employed; and occasionally on large farms, when the crop is much laid and twisted, it is resorted to. By the scythe the corn can be cut at a rather less cost per acre than with the hook; but the work is not always so neatly done. As nice a sward will be left by hand with the scythe, and often nearer than by the hook, but the sheaves are not, as a rule, so tidy after the scythe, though they will stack rather earlier. Of a fair working crop an adept at the scythe would cut 2 or 2½ acres per diem. The average, however, would not exceed 1½ acres. In fact, if the crop is heavy, that extent is a very hard day's work.

An attempt to trace the history of the reaping-machine would carry us far back into the earlier stages of agriculture. Pliny the Elder, who was born early in the 1 st century of the Christian era, found a reaping-machine in Gaul. He says, 'In the extensive fields in the lowlands of Gaul vams of large size, with projecting teeth on the edge, are driven over the standing corn by an ox yoked in a reverse position. In this manner the ears are torn off, and fall into the van.' Palladius, about four centuries later, found a similar appliance for reaping corn in Gaul. He gives a more detailed but similar description of the machine. Fig. 1, copied from Mr Woodcroft's Appendix to the Specifications of English Patents for Reaping-machines, represents what is conceived, from the descriptions, to have been the form of this machine.

In modern times the idea of a mechanical reaper appears to have originated with Capel Lofft (q.v.), who in 1785 suggested a machine something after the pattern of the ancient one described above. Between that time and the Great Exhibition of 1851 in London, from which the general use of mechanical reapers may be said to date, the patents taken out for reaping-machines were very numerous. Among the most promising of these may be mentioned those of Mr Gladstone of Castle-Douglas; Mr Smith of Deanston; Mr Kerr, Edinburgh; Mr Scott of Ormiston; Mr Dobie, an actor in Birmingham; Mr Mann of Ruby, near Wigton; and the Rev. Patrick Bell of Carnwallow, Forfar- shire. In 1826 Mr Bell constructed an efficient and simple machine, which long continued in use, and several features of which are observable in the reapers of the present day. The inventor of this, the first machine of the kind in Scotland, received a public testimonial from agriculturists, in consideration of the services he thus rendered to agriculture. In America Mr Hussey and Mr McCormick took out patents for reaping-machines of superior character in 1833 and 1834 respectively. The movements of the cutters of these machines were various. A few were advancing only, some sidelong and advancing, others reciprocating and advancing, a large number continuous and advancing, and others continuous and alternating. The reciprocating and advancing motion is that now employed on the machines in use.

The principal difference in the machines now so largely used for cutting corn is in the form and character of the cutters, and in the mode of delivering the grain and straw. Both are attached to a bar, and are made to work through another bar of iron fitted with hollow fingers, called guard-fingers, which, projecting forward, catch the standing corn, and retain it firmly until it is cut. The serrated knife saws through it, the plain knife clips it, as it were, the finger-guard forming the fixed blade of the scissors.
The delivery of the sheaves divides the machines into three kinds—(1) those delivered by manual labour; (2) those delivered by mechanical labour, or self-deliverers; and (3) combined reapers and binders, which deliver the sheaves ready bound. The delivery of the sheaves by manual labour is now chiefly at the back of the machine, the side-delivery being generally abandoned, unless in the self-deliveries. In delivering the grain, a man, with a short-handled rake in his hand, sits upon the machine almost opposite the cutting apparatus. With this he inclines the grain towards the knife; and, when sufficient has been cut to make a sheaf, he rakes it off the platform of the machine, on to which it has fallen, and deposits it on the ground. With the back-delivery the sheaves must be tied up and removed out of the way of the machine before it comes the grain towards the cutter. By an ingenious eccentric motion, the rakes are made to sweep the sheaves off the platform at intervals of about 12 feet apart, to the side, and out of the way of the horses. The self-deliverer costs from £25 to £30.

The more recent automatic combined reaper and binder promises to supersede entirely all other reaping-machines. The general appearance and arrangement of Howard's light steel-frame sheaf-binder is shown in fig. 3. The cutting portion of the binder is very similar to that of an ordinary reaping-machine. The cut grain as it falls back on the machine is conveyed by an endless web over the top of the driving-wheel to the knotter. Here it falls into two arms called compressor jaws. These retain it on the knotter table till a sheaf of the prescribed size has accumulated. 'Whenever a sheaf of the desired size has been delivered to the compressors, these relieve the tripper, which sets in motion the needle (carrying the binding twine) and the knotting apparatus. The needle is circular, and in its course it passes the band (twine) round the sheaf, when the band is caught by the knotter, and almost instantaneously a firm and secure knot is tied, while the needle is drawn back ready to operate on a new sheaf. As soon as the knot is tied and the string cut, the sheaf is ejected from the machine in a horizontal position, dropping gently on the ground on its side quite clear of the machine' (Book of the Farm). With a moderate crop of standing grain the binder in its various improved forms does its work in a most admirable manner, though when the crop is badly 'laid' it cannot be used satisfactorily. It is expeditious, and surpasses all other methods in neatness and thoroughness of work. When the binder was first introduced the thresher was the same as at present. There were strong objections to its use, however, and it was not until twine was substituted that the invention made any headway. There are now several British firms engaged in making binders, which are gaining in popularity year by year. A binder costs about £26.

See Woodcroft's Appendix to Patents for Reaping-machines; Mr. Jacob Wilson's 'Essay on Reaping-machines,' in Transactions of Highland Society for January 1864; Book of Farm Implements and Book of the Farm, by Henry Stephens; J. C. Morton's Cyclopaedia of Agriculture.

**Reason.** See the articles in this work on Psychology, Logic, Induction, Sylogism, Kant, Philosophy, and works cited under these.

**Réaumur.** RENE ANTOINE FERCHAULT DE, physicist, was born at La Rochelle, 28th February 1683, and studied in the Jesuits' College at Poitiers, and afterwards at Bourges. In 1703 he went to Paris, where he attracted general attention by the publication of three geometrical Memoirs; and in 1708 he was elected a member of the Academy of Sciences, and was charged with the supervision of the work Description des Divers Arts et Métiers, published under the auspices of the government.

Réaumur lightened his labours with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, auriferous rivers, and turquoise mines of France. The collections of Memoirs of the Academy of Sciences from 1722 till 1725 contain a number of papers by Réaumur,

---

**Fig. 2.—Samuelson's Self-delivery Reaping-machine.**

In sheaves. Samuelson's sheaf-deliverer will be made plain by fig. 2. The machinery consists of a series of four rakes—two toothed and two plain—attached to an upright shaft in such a manner as to admit of a free ascending, descending, and horizontal motion. The two toothless rakes or 'dummy' are shorter in the arms by six inches than the other two, and are merely employed to incline the grain towards the cutter. By an ingeniously eccentric motion, the rakes are made to sweep the sheaves off the platform at intervals of about 12 feet apart, to the side, and out of the way of the horses. The self-deliverer costs from £25 to £30.

The more recent automatic combined reaper and binder promises to supersede entirely all other reaping-machines. The general appearance and arrangement of Howard's light steel-frame sheaf-binder is shown in fig. 3. The cutting portion of the binder is very similar to that of an ordinary reaping-machine. The cut grain as it falls back on the machine is conveyed by an endless web over the top of the driving-wheel to the knotter. Here it falls into two arms called compressor jaws. These retain it on the knotter table till a sheaf of the prescribed size has accumulated. 'Whenever a sheaf of the desired size has been delivered to the compressors, these relieve the tripper, which sets in motion the needle (carrying the binding twine) and the knotting apparatus. The needle is circular, and in its course it passes the band (twine) round the sheaf, when the band is caught by the knotter, and almost instantaneously a firm and secure knot is tied, while the needle is drawn back ready to operate on a new sheaf. As soon as the knot is tied and the string cut, the sheaf is ejected from the machine in a horizontal position, dropping gently on the ground on its side quite clear of the machine' (Book of the Farm). With a moderate crop of standing grain the binder in its various improved forms does its work in a most admirable manner, though when the crop is badly 'laid' it cannot be used satisfactorily. It is expeditious, and surpasses all other methods in neatness and thoroughness of work. When the binder was first introduced the thresher was the same as at present. There were strong objections to its use, however, and it was not until twine was substituted that the invention made any headway. There are now several British firms engaged in making binders, which are gaining in popularity year by year. A binder costs about £26.

See Woodcroft's Appendix to Patents for Reaping-machines; Mr. Jacob Wilson's 'Essay on Reaping-machines,' in Transactions of Highland Society for January 1864; Book of Farm Implements and Book of the Farm, by Henry Stephens; J. C. Morton's Cyclopaedia of Agriculture.

**Reason.** See the articles in this work on Psychology, Logic, Induction, Sylogism, Kant, Philosophy, and works cited under these.

**Réaumur.** RENE ANTOINE FERCHAULT DE, physicist, was born at La Rochelle, 28th February 1683, and studied in the Jesuits' College at Poitiers, and afterwards at Bourges. In 1703 he went to Paris, where he attracted general attention by the publication of three geometrical Memoirs; and in 1708 he was elected a member of the Academy of Sciences, and was charged with the supervision of the work Description des Divers Arts et Métiers, published under the auspices of the government.

Réaumur lightened his labours with occasional researches into various subjects of natural history. These researches occupied him from 1708 to 1715, and were followed by a series of investigations into the condition of the woods, auriferous rivers, and turquoise mines of France. The collections of Memoirs of the Academy of Sciences from 1722 till 1725 contain a number of papers by Réaumur,
in which he details his discoveries of the mode of producing steel from iron, and of the mode of tinning iron. For these and other researches he received the prize of the French government a sum of 12,000 livres, which he spent in promoting and encouraging the industrial arts in his native country. In 1739 he succeeded in producing an opaque glass which was equal to the porcelain of Saxony and Japan. His invention of the Thermometer (q.v.) which bears his name need not be more than mentioned here. He died of a fall from a horse, 17th October 1757, leaving behind him a voluminous collection of works on all the subjects above stated, also a treatise on "the silk of spiders," a "Thermometric researches on air," and on mixtures of fluids with fluids or solids, and his Mémoires pour servir à l'Histoire des Insectes (Amsterdam, 12 vols. 1757-48).

Rebec (Arabic rebab), an ancient musical instrument of the violin kind, of which the body, originated from that once speaking to the inhabitants, like other instruments of the same tribe, was narrow towards the neck, and gradually enlarged till it rounded off at the lower end. Milton, in his L'Allegro, characterises this instrument as the 'jocund rebec.'

Rebecca Riots, 문서 of popular outbreaks which occurred in Carmarthenshire in 1843-44, and quickly spread over Pembroke, Cardigan, and Brecon. They grew out of the impatience of the people at the great increase of toll-gates on public roads, and owed their singular name to their adopting as a motto Genesis, xxiv. 60. Bands of men live hundred strong, their leaders disguised in women's clothes, secured the country by night, threw down the toll-bars, and then dispersed. A strong force of soldiers was poured into the country, but the rioters offered an obstinate resistance, and were not put down without great difficulty and consider- able bloodshed. The commission appointed by government to inquire into the causes of the outbreak found that it grew out of a genuine public grievance, whereupon measures of relief were introduced. The rioters seized were punished lightly.

Rebellion. 'The Great Rebellion' generally means the rising of the Long Parliament against the authority of Charles I. (q.v.). See also CROM- WELL, FALKLAND, HAMPDEN, &c.; ENGLAND (p. 592); and the works of S. R. Gardner. The revolts on behalf of the House of Stuart in 1715 and 1745 are often, particularly in Scotland, spoken of emphatically as 'The Rebellion' (see JACOBIUS). The term is applied in the United States to the secession of the southern states.

Receipt, an etymological representation of a name or thing by using pictorial devices for letters, syllables, or parts of words. The term probably originated from a desire speaking to the beholder non verbis sed rebus. Devices of this kind, allusive to the bearer's name, were exceedingly common in the middle ages, particularly in England. In many instances they were used by ecclesiastics and others who had not a right to armorial ensigns. See BAGGE.

Récamier, Madame (née JEANNE FRANÇOISE JULIE ADELAIDE BERNARD), a famous Frenchwoman, was born at Lyons, 4th December 1777. She grew up a girl of remarkable grace and beauty, and at fifteen she was married to M. Jacques Récamier, a rich banker about three years her own age. Her face was soon filled with the brightest wits of the literary and political circles of the day, but fortunately for herself Madame Récamier possessed a temperament that saved her from temptation and almost scandal. For Madame de Staël she had a warm affection that survived the exile required by the jealousy of Napoleon. Soon after this her husband was completely ruined, and Madame Récamier visited Madame de Staël at Coppet in Switzerland (1806). She met Prince August of Prussia, who alone of all her innumerable admirers is supposed to have touched her heart. Indeed a marriage was arranged, provided M. Récamier would consent to a divorce. The good man did not refuse, but his kindness was too much for the generous heart of Madame Récamier, who declared she could not leave him in his adversity. The most distinguished friend of her later years was M. de Chateaubriand.

In 1840 he became a whilower, and he then wished to marry Madame Récamier. But the long presence of her husband had been dead since 1830, but the lady declined the honour without interrupting the current of their friendship. Chateaubriand died 4th July 1848, and she followed him to the grave on 11th May 1849.

Receval, a town of Italy, 15 miles S. of Ancona, has a Gothic entablature with a monument to Pope Gregory XII. Here Leopardi was born. Pop. 3884. Porto Receval, 6 miles N.E. on the Adriatic coast, has a pop. of 3046.

Receipt is the technical as well as popular term signifying a legal acknowledgment of money received in the course of a deal between men. In England it is often believed that a written receipt is the only legal proof of payment; the fact being that it is only one mode of proving it. If the money be paid in presence of witnesses, or even without witnesses, provided a judge or judge believe the statement on oath of the party paying it, then it is in England quite as good evidence of the pay- ment as if a written receipt were given; and even a written receipt is conclusive only where it is under seal, or endorsed on a conveyance under the Conveyancing Act 1881, unless the purchaser had notice to the contrary, or the conveyance was to be cancelled before delivery, otherwise the receipt is inadmissible as evidence of payment; but on payment of certain penalties the receipt may be after-stamped with an impressed stamp. Not only is a receipt proper subject to stamp-duty, but also any note or memorandum given to a person on payment of money, and acknowledging payment of any part of a debt or demand, whether signed or not; so receipts given on payment of bills of exchange or promissory-notes are liable to stamp-duty. But a mere acknowledgment of indebtedness makes the receipt of the money itself not stampable as a receipt. There are several exceptions from liability to stamp-duty. Such are receipts for deposits with bankers to be accounted for; receipts for any parliamentary taxes or duties, or for any payment to the Sovereign; receipts by officers, such as taxes, excises, or duties to be paid; receipts for purchase of government stock or for money due under Exchequer Bill; receipts written on any bill or note of the Bank of England or of Ireland, on the back of duly stamped bills of exchange or promissory-notes, or upon the back of duly stamped instruments acknowledging the receipt of money; and generally receipts to or by government departments. At one time, under the Act of 1803, it was supposed to be the duty of the debitor to provide stamped paper for a receipt, the
creditor being liable in a penalty of £10 if he refused to sign. This act, however, is repealed, and the better view is that when the debtor tenders payment the creditor is bound to accept it, and if he refuses to do so the discharge is void. The validity of the discharge being regulated by custom. In Scotland the receipt of money cannot be proved by witnesses where the debt was created by writing, and it is not allowed to dispute the validity of a written receipt except in cases of fraud. It is only in the case of where the receipt of the price can be proved by parol. See Tisley's Stamp Laws (3d ed. 1871).

Receiving Stolen Goods. See Theft.

Recent Period. See POSTGLACIAL AND RECENT SYSTEM.

Recidivists, in France, are the habitual criminals. In 1883-84 the French government proposed to send them to New Caledonia, giving them a certain measure of freedom; but against this proposal the Australian colonies protested most vigorously. See NEW CALEDONIA.

Recife. See PERNAMBUCO.

Reciprocity, in Political Economy, a term for an arrangement between two countries having a protective tariff against other countries, to admit each into the other's territories certain specified taxable articles of commerce duty-free or at exceptionally light duties. The clauses of articles are arranged to bear one another on one side and the other. Such mutual arrangements are sometimes called Fair Trade (q.v.) as opposed to Free Trade (q.v.) and thorooughgoing Protection (q.v.), and has been advocated as between Britain and her colonies. The mutual relation between Canada and the United States, advocated in 1883-91 by a powerful party in Canada as well as on the other side of the frontier, proposed a complete commercial union—Zollverein (q.v.)—so that, while between Canada and the United States there should be no tariff at all, all goods from the rest of the world (including Great Britain) should have a strong protective tariff to face. See A. J. Wilson's Reciprocity, &c. (1880).

Recitative. See MUSIC, OPERA.

Reclamation. See WASTE LANDS.

Recueil, Jean Jacques Élisée, geographer, was born at Sainte-Foix la Grande (Gironde) on 15th March 1830, and educated at Montauban and under Carhart, 1846. He left France after the coup d'état of 1851, and spent the next seven years in England, Ireland, North and Central America, and Colombia. He returned to Paris in 1858, and published Voyage à la Sierra Nevada de Sainte-Morte (1861), and an introduction to the Dictator de l'Université de la France (1864). For being concerned in the Communist outbreak of 1871 he was banished from France, but returned under an amnesty in 1879. Whilst living in exile in Switzerland he began his great masterpiece, Nouvelle Géographie de l'Emper (17 vols. 1870-91). A Professor at Brussels since 1893, he has also written a great physical geography entitled La Terre (2 vols. 1867-68; Eng. trans. 1871 and 1875); Histoire d'un Russie (1866); besides Les Phénomènes Terrestres (1873) and Histoire d'une Montagne (1880).

Recognition is a kind of judicial bond entered into by the debtor and the object of which is to secure the doing of some act, as the appearance of witnesses at a criminal trial, or the keeping of the peace by one who has threatened or assaulted another. The form of it is thus: A B doth acknowledge to owe to our lady the Queen the sum of ten pounds, or some other sum, to be levied of his goods if he fail in the condition endorsed; and then a condition is added, which states that, if the thing secured is done, then the recognisance is to be void. This is the mode by which justices of the peace secure the attendance of the parties. The Court may issue a passport to any prisoner who has been committed for trial, or the future good behaviour of one who has committed a breach of the peace. If the thing secured is not performed, then the recognisance is estreated—i.e., extracted and put in force, a debt of the amount specified being forsworn by the crown.

Recoil. See CANNON, GUNNERY, MONCHIEFF PITS.

Recollets (Lat. recollectus, 'gathered together'). See FRANCISCANS, Vol. IV. p. 793.

Record, as a legal term, is used in the United Kingdom to signify anything entered in the rolls of a court, and especially the formal statements or pleadings of parties in a litigation. In general the rule is well settled that the pleadings which make up the record do not enter into details of the evidence, but merely set forth the conclusions or inferences, leaving the details of evidence to be supplied at the trial before a jury, or, if there is no jury, at the hearing before the judge or court. Hence in a suit of a nature involving the trial the court or judge can commit for contempt any person who insulfs the court or wilfully obstructs the business. A trial by record means that one of the parties has set up some former decision of the court, while the other denies that such a decision ever existed; whereas, in the ordinary trial the only manner of solving the question is by producing the record of the former action, and so settling the dispute. In Scotland the closing of the record is a step which requires the sanction of the judge, who elects the record after each party has said all he wishes them to be by way of statement and answer.

Recorede, Robert, mathematician, was born about 1500 at Tenby, in Pembrokeshire, Wales. He completed his education at Oxford, but, wishing to make medicine his profession, removed to Cambridge, where in 1545 he received the degree of M.D. In 1547 he was in London, engaged in the composition of The Urnul of Physic (1548), and was about the same time appointed physician to Edward VI., as afterwards to Queen Mary. Ten years later we find him in the debtors' prison in London, where he died miserably in 1558. His works are all in the form of dialogues between a master and his pupil, written in the rude English of his time; they are The Grounde of Artes, teaching the Perfect Work and Practice of Arithmetike (1543); The Pathways to Knowledge (1551), an abridgment of Enchy's Elements; The Castle of Knowledge, containing the Explication of the Sphere both Celestial and Material, (1551), an astronomical work, in which he compares the Ptolemaic and Copernican systems; The Wetsstone of Wit (1557), a treatise upon algebra. In the appreciation of the general results derivable from algebraic formulæ he is far beyond his contemporaries, with the exception of Vieta (1528-1603).

Recorder is a judge of a city or borough court of quarter sessions. He must be a barrister of not less than five years' standing, is appointed by the crown, holds office during good behaviour, and the salary is paid by the city or borough out of the borough fund. He sits as sole judge of the court of quarter sessions, but he cannot grant licenses or be an official in licensing matters, or order rates to be levied. The recorder is not prohibited from practising at the bar, and indeed his salary is usually small. He can appoint as deputy, in case of necessity, a barrister of five years' standing, and is the constant magistrate of the district. In London he is elected by the Lord Mayor and aldermen, and as 'mouthpiece of the
city,' he certifies the customs of London. He is chief judge in the Mayor’s Court of London, and is one of the judges sitting at the Central Criminal Court, the Exchequer Court, and the High Court of Admiralty; the many well-known men who have held this post were Lord Coke and Lord-chancellor Jeffreys. There is no such office in Scotland, but the sheriff discharges similar duties.

**Recorder**, the name of an old musical instrument somewhat like a flageolet, but with the lower part wider than the upper, and a mouthpiece resembling the beak of a bird.

**Records, PUBLIC** (Lat. recordari, 'to remember'), contemporary authenticated statements of the proceedings of the legislature, and the judgments of those higher courts of law which are distinguished as Courts of Record. An act, 1 and 2 Vict. chap. 94, sets at rest the question what is legally to be held a record, by providing that the word records shall be taken to mean all rolls, records, writs, books, proceedings, decrees, bills, warrants, accounts, papers and documents whatsoever belonging to Her Majesty, or then deposited, or which ought to be deposited, in any certain places of custody which are enumerated. This statute, together with the Act 40 and 41 Vict. chap. 53, has placed under the care of the Master of the Rolls the vast mass of documents stored in the Public Record Office.

Parchment is the material on which the greater portion of the records are written. The so-called ‘rolls’ of the several courts are comparatively short skins attached at the top after the manner of books, but the lines of the writing run parallel to the line of binding. In other cases they are sewed together consecutively, as in the same way the Patent and Chancery rolls, and in the Royal Courts of Justice have for the past length. Some records are in the form of books, as Domesday; others are filed—i.e. each document is pierced with a string or gilt pass through it, the whole being fastened together in bundles. Many of the later records are written on paper.

The early parliamentary records and statutes are principally in Norman-French, which continued in partial use till the time of Henry V.; all the other great series of records, except those of parliament, are in Latin down to the reign of George II. For later, except during the Commonwealth, when English was substituted.

Public records, which can be traced in germ before the Conquest, gradually expanded under the Norman and Plantagenet Kings. They enabled the subject to defend and maintain those feudal rights and privileges which were gradually eroding on royal prerogatives, and to protect himself from arbitrary exactions; while to the king they furnished precedents which could not be questioned for his calls of military service and taxation.

The various courts being the King’s Courts, and founded on the several times and places; the earliest depositories were the royal palaces in different parts of England; but when the higher courts were permanently established at Westminster, ‘treasuries’ or places of custody of the records of the courts, were appointed there. A portion of the public records were, as far back as Henry III.’s reign, deposited in the Tower of London and the New Temple; and in the reign of Edward III. the Tower became a permanent treasury. The parliamentary committee of 1837 enumerated among the places of deposit a room in the Tower over a gunpowder magazine, and close to a steam-engine in daily operation; a chapel at the Rolls, where divine service was performed; underground vaults at Somerset House; damp and dark cellars at Westminster Hall; the stables of the late Carlton Ride; and the Chapter-house, Westminster. From the reign of Edward IV. downwards the Exchequer records have often been called to the safe custody and arrangement of the records as an object of solicitude. The fullest examination in recent times was made by a committee of the House of Commons in 1800, whose report presents the most comprehensive account of the records in existence. A deputy was appointed to go on with the work which the committee had begun, and was renewed six times between 1800 and 1831. All the several record commissions directed the commissioners to cause the records to be methodised, regulated and digested, bound and secured, and to have calendars made, and original papers printed; and numerous valuable publications have been issued by the commissioners from time to time. The new edition of Rymer’s Foedera, the calendar of Inquisitiones Post Mortem, and the editions with excellent indexes of the earlier Patent and Close Rolls and the Rolls of the Curia Regis are especially to be noted. An inquiry as to the materials for English history to be found in the Vatican and other foreign libraries was instituted about 1834 by the Record Commissioners, and the results were printed under the title of Additional Records, but have never been formally published. Copies, however, were disseminated, and may be consulted in the British Museum Library and elsewhere, but the report itself has never appeared. Following this example, agents have been employed by the Public Record Office to stay at Paris, Rome, Venice, and Rome for many years, and the results of their labours have been partly published, while the remainder may be consulted at the Record Office.

A full investigation into the proceedings of the Record Commissioners is found in a committee of the House of Commons in 1835, and since 1840 annual reports have been issued by the Deputy-keeper of the Records. By the statutes referred to above the Master of the Rolls is empowered to appoint a deputy-keeper of the records, and, in conjunction with the Treasury, to do all that is requisite in the execution of this service. He makes rules for the management of the office, and fixes what fees may be demanded. He allows copies to be made, which, when certified by the deputy and assistant keepers, and authenticated with the seal of the office, are prima facie evidence in courts of law. The Home Secretary directs from time to time such of the catalogues, calendars, and indexes, and such of the records as he thinks fit, to be printed, and sold at prices fixed by him. All Record publications may be procured directly from the Queen’s Printers, East Harding Street, Fleet Street, and detailed catalogues of them may be obtained from the same source.

The present Public Record Office, a handsome fireproof building in Petty Lane, was begun in 1851 on a plan which admits of extension as the needs of the times may require. It must be remembered that modern documents as well as old form the subject of the deputy-keeper’s care), and provision has been made for the transfer into his hands of the records which are growing from day to day in the great administrative and legal departments of the government, as soon as they have ceased to be needed for frequent reference.

The principal contents of the Record Office may be classified under seven principal groups. Records of (1) the Superior Courts of Law, including the Courts of Chancery, Queen’s Bench, and Common Pleas, and the Exchequer, with its important financial as well as legal machinery; (2) Special and Abolished Jurisdictions, such as the Courts of Arches, Chivalry, Requests, and Star-chamber; (3) Duchy
of Lancaster; (4) Palatinate of Durham; (5) Palatinate of Lancaster; (6) Principality of Wales; (7) The Collections of the Most Important Public Records of Great Britain, by C. Burton Cooper (2 vols. 8vo, 1832); Official Handbook to the Public Records, by F. S. Thomas (8vo, 1853); Our Public Records, by A. C. Ewald (8vo, 1873); and A Guide to the Principal Classes of Documents preserved in the Public Record Office, by S. R. Scargill-Hill (8vo, 1891). An introduction to the art of searching for materials, whether historical, topographical, genealogical, or legal, is afforded by the present writer's Records and Record-searching (8vo, 1888), while a person not acquainted with the ancient legal terms cannot do better than consult C. T. Martin's edition of Wright's Court Hand Restored.

This contains useful glossaries, lists of abbreviations, ancient alphabets, and specimens of the old handwriting, which vary greatly from century to century. See Paleography.

In the various classes of materials on record, it is not always easy to imagine from the fact that, to cite only two classes of documents, there are more than 18,000 Close Rolls, and many thousands of Corn Roll and De Banco Rolls, each of the latter in the Tudor period containing from 500 to 1000 skins of parchment.

The supreme need of such a depository are indexes, and indexes to indexes. The latter requirement is tolerably supplied by the 'List of Calendars, Indexes, &c.' in appendix ii. to the 41st Report of the De Lacis, (8vo, 1890); but the indexes themselves to which this list of 745 items in a directory are sadly deficient. They do not furnish guidance to a twentieth part of the mass of documents, and many of them are merely eclectic. A recent addition to this series is 'General Plan' by Harlan's voluminous MS. Index to the De Banco and other rolls, which has been acquired at the public expense.

Numerous charters of the greatest antiquity are to be found in the Public Record Office, and there of course is preserved Domesday Book; but, understanding by 'charters' a fairly continuous series of official documents, we may say that the earliest are the Pipe Rolls or Great Roll of the Exchequer. That for 31 Henry I. stands alone, but is soon followed by an unbroken series of Pipe Rolls extending from 2 Henry II. down to modern days. These are accounts of the revenue of the kingdom both as regards receipt, and expenditure, and they contain items of the greatest possible historical interest. The Pipe Roll Society (established 1884) is gradually printing them. Next in order of antiquity are the Patent Rolls, which begin with 3 Henry I. but do not cover more than a day, and the Close Rolls, which present a similarly unbroken series from 1294. The former contain matters patent or open to the public, such as grants of offices, crown-lands, liberties, confirmations of previous grants, grants to corporate bodies, patents of migrating or new towns, lists of officers, grants of fines, quarterings, proclamations, safe-conducts, presentations to benefices, restitutions of temporalities to bishops, abbots, &c.

The Close Rolls contain mandates, letters, and writs of a private nature which were closed or sealed, and were reserved to domestic and public matters, orders to the sheriffs on all kinds of questions, and directions as to raising subsidies. The historical value of these two series of Rolls is immense, as in the earlier years all the state correspondence, both foreign and domestic, is recorded in one or other of them.

Other titles in the Public Records, either from the reign of Edward I. or from still earlier times are the Carte Antique, early transcripts of charters ranging from Ethelbert, king of Kent, to Edward I.; Charter Rolls, containing the king's grants of land, dignities, &c.; Exchequer Rolls, accounts of military and property forfeited to the crown; Feet of Fines, records of the endings of fictions suits as to land, which are in reality deeds of conveyance, ranging from 7 Richard I. to William IV.; Rotuli Curiae Regis, some of which are as early as Richard I., and are records of the cases decided in the King's Court up to the reign of Edward I., by whom the court was divided into the King's Bench, Common Pleas, and Exchequer; Cornum Regis Rolls, or records of the crown side of the King's Bench, including Assize, Eyre, Coroners, and Great Delivery Rolls; De Banco Rolls, or records of the Court of Common Pleas; Inquisitiones Post Mortem, a treble series (Chancery, Wards and Liveries, Exchequer) of inquiries as to the land held by tenants in capite at time of decease, and as to their heirs; original Rolls of the Exchequer, containing entries of any service, rent, or other payment due to the crown; antient rolls; Subsidy Rolls, also Exchequer documents, often containing the names of the taxpayers under villages and towns, and most valuable to the topographer; Pell Records, including the Liberato Rolls and Issuaco Rolls, consisting of entries of payments of salaries, pensions, &c.; Customs Rolls for various ports; Memoranda Rolls (Exchequer), enrollments of writs of Scire Facias, informations, outlawries, and a multitude of other matters; Pardon Rolls, enrolments of pardons up to 2 James I.; Quo Warranto Rolls, respecting derivations of offices or franchises; Ordinary, or Paper Rolls, offerings to the king for renewals of charters, enjoyment of lands, offices, and privileges; Parliament Rolls, petitions to and proceedings in parliament, beginning from the reign of Edward I.; State Rolls, the Journals of the Lords and Commons from Henry VIII., and other parliamentary records.

The foregoing are more or less continuous records, but there are some of an occasional character or of limited annual duration, but still of great importance, such as the Hundred Rolls, presentations of injustice claims, charters of privileges to boroughs and manors, franklendage, and assizes of bread and ale; the Liber Niger, and Liber Rubens Sexacarii, and Testa de Nevill, lists of tenants in capite and knight's fees; Taxatio Ecclesiastica, an account (1291) of the taxation of benefices; Inquisitiones Nonarum, which included a valuation of benefices in the fourteenth year of Edward III.; French Rolls, Norman Rolls, Gascun Rolls, copies of treaties, truces, orders, summonses, grants of safe-conduct, and other matters respecting the affairs of those parts of France which went under the English crown, and Kinds of Letters, or Writs of Privilege, in 20 Henry VII.; Flaga de Secretis, trials for state offenses of a specially secret nature, from Anne Boleyn to the Stuart adherents of 1715 and 1745; Royalist Composition Papers (1649-60), containing statements as to estates and families of nobility.

The state records (Domesday, Foreign, Colonial, Irish, and Scotch) originally sprung from the Privy-council and Chancery, and include the correspondence of the Privy-council, secretaries of state, and other public departments, with miscellaneous correspondence from the time of Henry III. These, being the correspondence of the highest political officers of the kingdom, relate to an infinite variety of matters. They have been carefully arranged, and more than 120 volumes of
calendars, covering a large portion of the field, have now been published.

The activity of the authorities of the Public Record Office has, however, not been confined to the records stored in Fetter Lane, for since 1858 the Master of the Rolls has issued, under the authority of the Crown, various parts of the series known as Chronicles and Memorials of Great Britain and Ireland. These are carefully edited texts of the ancient chronicles, such as William of Malmesbury, Gervase of Canterbury, William of Newburgh, and Matthew Paris, collated with other manuscript sources in libraries, and prepared by specially selected editors.

The Historical Manuscripts Commission, though not in name a department of the Record Office, is in reality closely connected with it. In answer to requests from this body, private libraries and municipal rooms all over England, Ireland, Scotland have, almost without exception, been thrown open to authorised visitors, who have reported on their principal MSS. contents. Since 1857 many volumes of reports on these collections have been published, embodying transcripts of documents of a public nature, and giving brief abstracts of a host of others.

The Literary Search Room at the Public Record Office is open from 10 to 4 every day, except Saturday, when it closes at 2 o'clock, and a few private rooms also are open on Saturday. Any respectable person may, on entering his name and address in a book kept in the lobby, attend and consult almost any document he may desire to see. A few of course are subject to special reservation.

Scotland.—The public records of Scotland were unfortunately preserved at Edinburgh as early as 1282, as appears from an inventory of muniments examined in that year by the order of Alexander III.; and another inventory of Scottish rolls and writs was compiled at the command of Edward I. of England in 1291. Few, if any, of the documents mentioned in these lists are now known to exist. In 1631 the records of the Scottish parliaments and courts of justice were removed by Cromwell to the Tower of London. The more important of these, to the number of 1699 volumes, were restored in 1657, and the remainder, after the rest of the Advocates Library were packed in eighteen five hogsheads and shipped on board a frigate for Scotland; but in a violent storm they were transferred to a smaller vessel, which went down with its precious cargo. The control of the records has often been exercised by the Clerk of the Rolls and Register, or Lord Clerk Register; one of the high officers of state, who had a seat in the Scottish parliament, and to whom, and his deputies and other officers appointed by him, it was assigned to superintend both the formation and custody of the public records. These were at first in the inconvenient form of rolls, but in the reign of David II. the practice was introduced of writing them in books. By an act of 1463 the king's rolls and registers were appointed to be put in books; but the accounts in the Exchequer continued in rolls, as they had been kept in rolls early as the passing of another act in 1672, appointing them to be written in books. Originally the records were kept in the Castle of Edinburgh, but in later times they were deposited under care of the Clerk Register, in the Leith Parliament House, now part of the Advocates' Library; an edict before the Union the whole records were transferred to that depository, where they continued till the erection of the large building called the General Register House (1787). The Register House serves the purposes of public house and make it possible to bring all national monuments, as well as accommodating the whole offices of record connected with the supreme court. The Lord Clerk Register and his deputies have now merely the custody of the records, their preparation being entrusted to another class of officers.

Under the Scottish records are included the Acts of Parliament and of Privy-council, and the records of the several courts of justice, including that of the Registre of the Great Seal, Privy Seal, and Signet. An important class of records are the Retours of Services. A service is by the law of Scotland, in cases of intestacy, necessary to transmit a right to real property to the heir from his ancestor. At present this service consists of the determination of the title of the county or the sheriff of Chancery; but the form in use till 1847 was by retour, a writing which contained the verdict of a jury returned in answer to a briefe from Chancery for finding the heir at the death of his ancestor. The register of retours contains services from 1545.

The registers connected with the transmission of heritable rights are even more important. After several unsuccessful attempts to introduce a system of registration, the Register of Sases was established by Act 1817, chap. 16. By the system then introduced, the Act was continued, and in detail, all instruments requisite to the transmission of real property must, in order to convert mere personal right into real right, be put on record for publication. Besides the general register in Edinburgh, there are registers in the various counties kept at their respective county towns; but any instrument might be recorded either in the particular or the general register. Volumes were issued from the General Register House to the local recorders of sasses, which, when filled, were returned to the General Register House. This arrangement was changed by the Lands Registration Act of 1868, providing for the entire discontinuance of the particular registers before the last day of 1871, and enacting that all writs of this class be thenceforth recorded in the general register in Edinburgh, which register is so kept that the writs applicable to each county are recorded in separate series of volumes. By means of the Register of Sasses any title to real property can be ascertained with certainty and precision, and may, if necessary, be traced back nearly three centuries. It is also obligatory to record in separate registers all instruments necessary for the constitution, transmission, and extinction of voluntary encumbrances. See Registration. This system, while confirming the credit of the proprietor, also operates in favour of the security of creditors.

There is a special Register of Entails, in which, in terms of Act 1865, chap. 22, deeds of entail must be recorded at the sight of the Court of Session. There are also the records of the various commissariats, which include testaments and other relative documents. The object of registration in all these cases is publication; but charters by subjects, dispositions, bonds, contracts, and other probative writs may, under Act 1898, chap. 4, be recorded in the Register of Deeds for preservation. A third object of registration is execution. Every deed constituting a personal claim of debt, or an obligation to perform some lawful pretation, if intended to be made the subject of personal diligence for payment or performance, must be registered previously to execution being issued on it. Calendars of state papers relating to Scotland preserved in the English Record Office have been recently published; while the publication of the Scottish records in the Register House has been going on at intervals since 1811. These include the Acts of Parliament, Register of the Great Seal, Register of the Privy-council, Exchequer Rolls, Accounts of the Lord High Treasurer, and other records.
RECOVERY

See Apthorp's Calendars of Ancient Charters (1774); Acts of the Parliaments of Scotland, vol. i. appendix to preface; Reports of the Public Record Commissioners; the Record Publications—preface to the earliest volume of each series.

Ireland.—Many of the records perished during the wars prior to the final reduction of Ireland, and those which survived these commotions were long exposed to mutilation and destruction from the unsatisfactory arrangements for their custody. A commission was appointed in 1849 for the preservation and arrangement with the Irish Records, whose labours, conducted with considerable success, were terminated by the revocation of the commission in 1850. In 1847 commissioners were again appointed to investigate the state of the records, in consequence of whose labours a bill for their custody was prepared, but afterwards abandoned. In 1857, however, the Public Records (Ireland) Act was passed, and from 1869 the Reports of the Deputy-keeper of the Irish Records have been annually published. These include some documents and calendars in their appendices, notably a calendar of "Plantis (plantar literae potae) from Henry VIII.

Three volumes of a calendar of the Irish Patent and Close Rolls were published in 1861-63; and some other publications, including volumes of facsimiles of national MSS., have been issued by the Irish Record Office. This department since its formation in 1869 has done a great work in the way of collecting records from various depositories and arranging and cataloguing them. The records are open to searchers on payment of fees, but the deputy keeper may dispense with the payment of fees in his discretion, and will accede to the public from the searchers' work. One important feature of the Irish Record Office is the collection of Parish Registers made under Acts 38 and 39 Vict. chaps. 59, and 39 and 40 Vict. chaps. 58. This is an example which should be followed in England.

Recovery. See ESTABLISHMENT, ARMY, REGIMENT.

Rectifying is a process applied to alcohol, chloroform, or other volatile liquid, by which the last traces of impurities are removed by distillation. Preparations of stills have been devised for this purpose, for further reference to which see DISTILLATION, and ALCOHOL.

Rector (Lat. 'ruler'), in the Church of England, is a clergyman who has the charge and cure of a parish where the titles are not impropriate, and who accordingly has the whole right to the ecclesiastical dues therein; where the titles are impropriate the person is a Vicar (q.v.). In the Episcopal Churches of the United States and (since 1890) Scotland all incumbents are called rectors. See also EDUCATION, and UNIVERSITIES.

Rectum, the terminal portion of the intestinal canal, named, from its comparatively straight course, the rectum (see DISENTERY), is the seat of (1) Stricture or Laceration, which may be either of a simple or malignant nature. Simple stricture consists in a thickening and induration of the submucous tissue, less often of the muscular or mucous coat of the rectum, so as to form a ring encroaching on the calibre of the tube. It is situated most often about an inch from the anus, and the contraction is so great and unyielding that it is often difficult to pass a finger through it. It may occur as the result of injury or operation, of old ulceration (e.g., from dysentery), of syphilis, or without ascertainable cause. The symptoms are constipation and atony, and often fever. It may be treated; the parts must be alternately moistened with the waters, which, if not liquid, are passed in a narrow, flattened, or worm-like form that is very significant of the nature of the case. In an advanced stage of the disease diarrhoea and prolapsus often supervene. However great may be the constriction from stricture, it must be altogether avoided. Soft and unirritating evacuations must be procured by such medicines as the concoction of sterculia combined with sulphur (see PILES), or injections of castor-oil or of tepid water. The diet should be regulated so as to assist the action of the medicines. Nutritious soups are serviceable, since, at the same time, they support the strength and leave little matter to be evacuated. Gradual dilatation by suitable bougies often gives great relief, but must be steadily persevered with, as the contraction is almost certain to recur. Malignant stricture, which is commonly associated with the stricterns, but sometimes to the epithelial form of cancer—is by no means a very rare affection. Until ulceration sets in the symptoms are like those of simple stricture, only exaggerated in degree; but afterwards there is a discharge of fetid mucous-purulent matter which is extremely troublesome. In this case the treatment can, in most cases, be only palliative. Sometimes, however, if the tumour is low down and localised it may be removed with at least temporary relief. If complete obstruction occur, or is threatened, the surgeon may resort to the formation of an artificial anus in the loin or groin as a last resource.

(2) Spasm of the sphincter ani muscle is characterised by extreme pain in the region of the anus, especially when an attempt is made to evacuate the bowels. The muscle contracts so firmly that the surgeon cannot easily introduce the finger into the rectum. The spasm may be caused by piles, by fissure of the anus, by ulceration of the rectum, and sometimes apparently by mere constipation. It is often relieved by the application of the belladonna ointment of the British Pharmacopoeia.

(3) Nostrums of the rectum. Some purgatives, or proctalgia, is sometimes met with, and is especially prone to attack adult men and women persons. It is usually relieved by the judicious use of aperient medicines and such treatment as is used for other forms of Neuralgia (q.v.).

(4) Pruritis ani, or itching of the anus, is a very common and extremely troublesome affection. Sometimes it depends on the presence of threadworms, of old piles, constipation, or some other local cause of irritation, while in other cases it is one of the manifestations of some constitutional condition. The treatment must depend upon the exciting cause. See works on the rectum by Allingham, Cripps, Henry Smith.

Recuver, a village of Kent, 1 mile from the sea, and 9 miles W. of Margate, with remains of the Roman station Requibium. Pop. 298.

Recusants, persons who refuse or neglect to attend at the worship of the established church on Sundays and other days appointed for the purpose. The offence as a legal one may be hold to date from the proclamation of 1652; but it was not punishable under the statutes against recusancy until the reign of Charles II.; 'recusants convic' who absented themselves after conviction; 'popish recusants,' who absented themselves because of their being Roman Catholics; and 'popish recusants convic' who absented themselves after conviction. Protestant dissenting recusants were
relieved from the penalties of recusation by the Toleration Act of 1 Will. and Mary, chap. 18. Catholics were partially relieved in the year 1791, and completely by the Emancipation Act of 1829.

**Red.** Most of the important red pigments have been already noticed. For Carmine and crimson lake prepared from cochineal, and also for the madder red, see L. 1830 to be the red earth, which oxide of iron is the colouring ingredient—viz. Indian red, Venetian red, and light red—are referred to under OCHRES. Vermillion (q.v.) is one of the finest and most beautiful reds. It has now been ascertained, however, that it is not always quite so permanent, at least as a water-colour pigment, as was formerly supposed. For house-painters' use this colour is often adulterated with red lead, which, though forming a useful paint for some common purposes, is fugitive. The substances used for dyeing textile fabrics red are noticed under the head DYING.

**Redan.** See FORTIFICATION, SEBASTOPOL.

**Redbreast** (*Erythaca rubecula*), a bird of the family Sylviidae, well known in the British Isles because of its very general distribution, its early and legendary associations, its conspicuous plumage, and the fact of its being resident. Its range is gradually extending northwards, and now it is found as far N. as Hejnoy, in Zealand, where in spring it is found on the island of Jan Mayen, in autumn it visits the Faroes, but it has not yet been recorded in Iceland. Southwards it breeds throughout Europe (but only locally in the south of Spain), in North-west Africa and the Canaries, Madeira, and the Azores; and in Asia in the Ural Mountains. In winter its migrations extend to the Sahara, Egypt, Palestine, and Persia. The red-breast, known familiarly as Robin or Robin Red-breast, is about 5½ inches long, olive-brown in colour on the upper parts; chin, throat, and upper breast reddish orange, bordered with bluish gray on the sides of the neck and shoulders; under parts dull white; bill black; legs and feet brown; the body fairly full and round, the legs slender. The female is usually but not always duller than the male. In habit robins are domineering and pug- nacious, and they hoard the most preferred plantations, but coming near dwelling-houses when forced by severe weather. Nesting begins in March. The nest of dead leaves, dried grass and moss, and lined with hair and feathers, is made in banks, hollow trees, and sometimes in strange and extremely uncomfortable situations. The eggs are usually seven, are usually white with light reddish blotches, or pure white. Two or three broods are produced in the season. In autumn the young are forced by their parents to migrate, and at this season there is generally a great influx of robins from the northern parts of the Continent, where they have been passing the summer. The food consists chiefly of insects and worms; often of berries and other fruits; and in winter bread-crumbs and scraps of meat. Its song is sweet and plaintive, but of little compass, and not particularly pleasant to the ear. The widely distributed robin of the United States and Canada is a Thrush (*Turdus migratorius*).

**Redcar,** a popular bathing-resort in the North Riding of Yorkshire, 10 miles by rail NE. of Middlesbrough. Its smooth, firm sands stretch 10 miles from the mouth of the Tees to Saltburn. Pop. (1851) 2918.

**Red Cedar.** See JUNIPER.

**Red Crag.** See FLIOCENE SYSTEM.

**Red Cross,** the badge and flag adopted by every society, of whatever nation, formed for the aid of the sick and wounded in time of war, recognised and authorised by the military author-

**Red Cross Society** has become a generic name for all such voluntary efforts, and exists in any one of them. For three centuries or more a medical service has been attached to armies, and was long thought sufficient for every emergency, but the revelations made during the Crimean war (1853-56) were terrible. The merciful mission of the Red Cross Nurse, Miss Nightingale, and her comrades, when bearing the losses by one-half, threw light upon shocking defects, and compelled the acknowledgment of want of organisation in everything connected with the health of the troops and care for the wounded. Nevertheless, when the war broke out (1839) in Lombardy similar indigence was apparent. Local complaints arose, but the first practical result ensued from the publication by M. Dunant of his *Souvenir de Solferino*. The account of this battle (June 24, 1859), which lasted fifteen hours and in which 300,000 combatants were engaged, was so heart-rending as to force public attention to the necessity for supplementing the medical and sanitary service by volunteer societies trained and organised in time of peace. The book was discussed at Geneva at a meeting of the *Société Genevoise d'Utilité Publique*, February 9, 1863, and it was decided to be the meeting-place of the Red Cross. An international conference was then convoked, which assembled at Geneva, October 26, 1863, and included among its thirty-six members delegates from fourteen governments and six associations. A proposed code of international conventions was discussed, the main recommendations agreed to were (1) the formation in each country of a committee to co-operate with the army sanitary service in communication with the government, and occupying itself in time of peace with preparing supplies of hospital stores, training nurses, &c., and during wars furnishing the same in aid of their respective armies, neutral nations being invited to assist such national committees; (2) the declaration of the neutrality of hospitals, of the officials of the sanitary service, of the unpaid nurses, of the inhabitants of the country, and of the wounded and the sick; (3) the convention of Geneva, embodying these resolutions, was signed at a second conference at Geneva in 1864 by twelve out of sixteen representatives there assembled, and it has since been acceded to by every civilised nation. International conferences have been held at Paris (when the convention was extended to naval warfare), Berlin, and Vienna, but the resolutions passed at Geneva have not been materially altered. The International Committee still continues at Geneva, as a centre of communication between belligerent states, facilitating the action of the different societies and the transmission of relief offered by neutrals. The English Order of the Hospital of St John of Jerusalem, the National Society for Aid to the Sick and Wounded in War, the Eastern War Sick and Wounded Relief Fund, the Stavros Fund, the Comité National de Secours aux Membres Blessés, the Russian, the Austrian, and the Austrian Summerl Vereniging are among the best known of the numerous Red Cross societies. The Red Cross Society in the United States, since June 6, 1900, is organised under a charter granted by the General Assembly of the Committee at Geneva publishes quarterly, since 1862, the *Bulletin International des Sociétés de la Croix Rouge*. See also The Red Cross: Its Past and
In most species of Cervus they are first slightly spotted with white. In the first year the young male has only a hint of antlers, in the second year only small unbranched beams; thereafter a title is gained each year. Nearly allied is the North American wapiti (C. canadensis), and there are closely related species or varieties in Persia, Caucasus, and Tibet. Baillie Grolleau in *Sport in the Alps* (1896) has much about red deer. See Deer, Deer Forests, Stag-Hound; Red Deer, by R. Jefferey (1884); and *The Red Deer*, by Macpherson and others ("Fauna and Feathers", Series 1896).

Redlees, a town on the borders of Stirlingshire and Warwickshire, stands on an elevation 15 miles SSW. of Birmingham by rail. Needles, pins, fish-hooks, and fishing-tackle are made extensively. Pop. (1851) 4902; (1861) 9691; (1871) 11,293.

Reddle, Raddle, or Red Chalk (Scot. ochil), an impure oxide of iron (ferric oxide) associated with various proportions of clay or chalk, or sometimes other substances. It varies greatly in hardness, some kinds being difficult to crush and others quite soft. In colour it passes from a pale brick-red to a tint occasionally nearly as bright as vermilion. It is found in many places abroad, and in England in Somersetshire, the Forest of Dean, and Wiltshire. It is found in France, and, of a quality valuable for polishing optical glasses, near Rotherham in Yorkshire. Some kinds of it are used for marking sheep, others for carpenters' and masons' pencils, and the timer qualities for artists' enamels. Red ochre is one of the varieties.

Red Earth, the name given to the reddish-brown or earthy which so frequently occurs in regions composed of limestones. This earth is the insoluble residue of these portions of the calcareous rock which have been dissolved by rain. Such red earths are of common occurrence in limestone caverns. See Cave.

Redemptionists, one of the names of an order of monks devoted to the redemption of Christian captives from slavery. They are more frequently called Trinitarians (q.v.).

Redemptorists, called also Ligurians, a congregation founded by St. Alfonso Liguori (q.v.).

Redesdale, the valley of the river Reid in Northumberland, extending almost from the Scottish border in a south-easterly direction for over 16 miles, until it opens up into the valley of the Tyne, the river on the North Tyne at Redesmouth. It is for miles a mere mountain vale, sloping upwards into bleak and dreary moorland, but it has a quiet beauty of its own that is not easily forgotten by the traveller. The river springs out of the Cheviot Hills, which lie athwart the head of the vale, and down its course from Carter Tern on the border lay one of the chief roads into England. Watling Street itself traverses its middle and upper part. Near the southern end of Redesdale is the famous field of Otterburn (q.v.), but 16 miles from the border, which point again is but 10 miles from Jedburgh. The men of Redesdale of old were brave and turbulent, and bore more than their share in Border feuds and forays. Redesdale gave from 1877 the title of earl to John Thomas Freeman Mitford (1835–86), who was son of the ex-Speaker, John Mitford (1800–65). First Baron Redesdale, and who himself from 1851 was Chairman of Committees in the House of Lords, and a determined enemy of change in ecclesiastical matters.

Redeswire, RAID OF THE, a battle fought 7th July 1675 close to the English border at the pass leading across the Cheviots into Redesdale, about 6 miles ENE. of Chesters in Roxburghshire. A number of Scots attacked an English force to avenge the slaughter of a countryman, but were
beaten back and on the point of being utterly routed, when the provost and townsmen of Jedburgh arrived hot from the 10 miles' march, and at once set on the enemy. The Englishmen were soon completely defeated, with the loss of several considerable prisoners. There is a proxy ballad on the subject in Scott's Border Minstrelsy.

Red-eye, or Rudd (*Leuciscus erythrophthalmus*), a fish belonging to the same genus as roach, chub, and minnow. It is common in lakes, slow rivers, and tanks, in many parts of Europe and in England. It much resembles the Roach (q.v.), but is shorter and deeper. It is richly coloured, the name Rudd referring to the colour of the fins, the name Red-eye to that of its iris. The fish is better eating than the roach, and sometimes attains a weight of 2 lb.

Redgrave, Richard, painter, born in London on 30th April 1804, in 1826 was admitted a student of the Academy, and was elected an A.R.A. in 1840, an R.A. in 1851. From 1847 onwards he took a prominent part in art instruction, and in 1857 was appointed Inspector-general of Art Schools, which office, with that of Surveyor of the Royal Pictures, he resigned in 1880, being then created a C.B. In 1882 he was placed on the list of retired academicians, and next year he ceased to exhibit, having since 1823 contributed 154 pictures to the Academy, besides forty sent elsewhere. He wrote, with his brother, *A Century of English Painters* (1866), and edited several valuable catalogues. He died 14th December 1888. See *Memoir* by his daughter (1891).

Reding, Aloys von, the famous champion of Swiss independence, was born in 1765, in the canton of Schwyz. After serving in Spain he returned to Switzerland in 1783. As captain-general of the canton of Schwyz he repulsed the French Republicans, May 2, 1798, at Morgarten. After the formation of the Helvetic Republic Reding was one of those who eagerly worked for the restitution of the old federal constitution. In 1802 he founded in the eastern parts of Switzerland a league, with the intention of overthrowing the central government. Reding went to Paris in order to gain over the First Consul, but failed. Till 1803, and again after 1808, he acted as Landammann or chief-magistrate of Schwyz. He died 5th February 1815.

Red-letter Days. See BLACK LETTER.

Red Liquor. See CALICO-PRINTING, p. 645.

Redoubt. See FORTIFICATION.

Redout Kalé, a fortified post on the Black Sea coast of Russian Caucasus, is situated in a marshy region at the mouth of a small river, about 10 miles N. of Poti. It was the chief shipping-place for Circassian girls to Turkey, and was captured by the British fleet in 1854.

Redpole. See LINNET.

Red River, the lowest western branch of the Mississippi, rises near the eastern border of New Mexico, flows eastward through Texas, forming the entire southern boundary of Indian Territory, thence south-east through Arkansas and Louisiana, and enters the Mississippi below 31° N. lat. It is 1000 miles long, and receives the numerous branches, the Washita (Ouachita) the most important. It is navigable for seven months to Shreveport (350 miles). A few miles above is the Great Raft, of driftwood, which formerly blocked up the river.

Red River of the North, a navigable river of the United States and Canada, rises in Elbow Lake, Minnesota, and near the southern borders of the Mississippi, and flows south and west to Breakirkirke, then north, forming the boundary between Minnesota and North Dakota, and so into Manitoba and through a flat country to Lake Winnipeg. Its course is 665 miles (293 in the United States). The Red River Settlement was the origin of Manitoba (q.v.). For the Red River Expedition, see CANADA, Vol. II. p. 695, and RIEL.

Red Root (*Craspedia*), a genus of deciduous shrubs of the natural order Compositae. The common Red Root of North America (*C. americana*), which abounds from Canada to Florida, is a shrub of two to four feet high, with beautiful thysuli of numerous small white flowers. It is sometimes called *New Jersey Tea*, an infusion of its leaves being sometimes used as tea. It serves also as an astringent, and for dyeing wool of a cinnamon colour. A Mexican species has blue flowers, and a California kind is used for evergreen hedges.

Redruth, a town of Cornwall, on a hillside (414 feet) in the centre of a great mining-district, 9 miles by rail W. by S. of Truro. It has a town Hall (1850), 14 handsome houses (1861), a miners hospital (1803), &c. William Murdoch (q.v.) here in 1792 first used gas for lighting purposes. Pop. (1851) 7093; (1871) 10,685; (1891) 10,324.

Red Sea. The Red Sea is an arm of the Indian Ocean, running north-west from the Gulf of Aden, with which it communicates by the Strait of Bab-el-Mandeb, 134 miles across. Its length is about 1200 miles, and its width in the central portion is between 100 and 200 miles, the greatest breadth being about 205 miles; it narrows towards the southern entrance, while in the north it is divided by the peninsula of Sinai into two gulfs, the Gulf of Suez, 170 miles long by 30 miles wide, and the Gulf of Akaba, 24 miles wide.

The Arabian coasts of the Red Sea are usually narrow sandy plains backed by ranges of barren mountains; the African coasts towards the north are flat and sandy, but farther south high table-lands rise some 1000 feet in elevation, culminating still farther south in the lofty mountains of Abyssinia. A marked feature in the configuration of the Red Sea is found in the large existing and upraised coral-reefs running parallel to both the eastern and western shores, these being more extensive and farther from the coast than those to the west; the most important are the Farisan Archipelago in the eastern reef, and the large island of Duilah, lying off Annessley Bay, in the western reef. In addition to the islands of organic formation mention may be made of the volcanic group, which lies in 14° N. lat. of which, Jebel Zurgar, is 10 miles long, 7 miles wide, and 2074 feet in height; farther north, on the islet of Jebel Teir, is a volcano which was active until quite recently. A dangerous reef, the Desalnus, lies directly in the path of steamers in 24° 15' N. lat., and a lighthouse has been placed on it. The principal harbours on the Red Sea are Mocin, Hodeida, Lokeyyadh, Jiddah, and Yembo on the Arabian coast, and Massowah, Khor Nowarat, and Snakim on the African coast.
In ancient times the Red Sea was used as a means of communication by the Phenicians and other maritime peoples, until the discovery of the route round the Cape of Good Hope diverted the traffic into another channel, only to be revived, however, on a much more extensive scale with the construction of the Suez Canal.

The tides are very variable, depending largely on the direction and force of the winds, which also to a great extent determine the direction and velocity of the surface currents. The hot climate is due to the almost cloudless sky, and consequent want of rain, the altitude of the sun, and the absence of rivers. The mean temperature of the air generally ranges between 70° and 94° F. during the day, though readings of over 100° are often registered in the shade; but during the night the temperature may fall to the freezing-point, owing to radiation in the clear atmosphere. The prevailing wind on shore is north-north-west almost universally, but from October to May south-south-east winds prevail over the southern portions of the sea, a belt of calms and variable winds occurring in the central part of the basin in the latter season; the usual north-north-west winds are met with. Evaporation is very great, and the air over the water is always very moist in the summer; hurricanes are unusual, but rain-showers frequently occur with the southerly winds, and moderate gales and sandstorms, called 'dragons' in the popular language of the Arabs, are not uncommon.

The mean temperature of the surface water in the Red Sea varies at the northern end between about 63° and 79° F., in the central regions between 71° and 89°, and at the southern end between 75° and 90°; readings of over 100° have been recorded at the southern end of the sea. The temperature of the water below the surface decreases down to a depth of about 200 fathoms, from whence down to the bottom a mean temperature of about 71° is found all the year round; this agrees with the temperature conditions prevailing in the enclosed seas of the East Indies, for instance, according to the observations made on board the Challenger, the depth at which the minimum temperature occurs (i.e. 200 fathoms in the Red Sea) indicating the depth of water over the barrier separating the Sea from the open ocean. Below 200 fathoms in the northeastern part, the whole body of water from surface to bottom usually has a mean temperature of 71°.

The salinity of the water is almost constant at about 1.030 (ordinary ocean water is about 1.026), and this is due to the fact that no rivers flow into it, little rain falls, and the evaporation is excessive. It has been estimated that, were the Red Sea entirely enclosed, it would become a solid mass of salt in less than two thousand years, but this is prevented by an inflow of water through the Strait of Bab-el-Mandeb, and it is also known that a current of water from the open ocean flows out underneath the incoming surface current.

The greatest depth in the Red Sea is about 1200 fathoms, and the mean depth of the whole area about 375 fathoms. From the point of greatest depth, which is near the centre, the bottom rises towards each end. Owing to the absence of rivers the deposits approach in character those formed in the open ocean, being largely composed of Foraminifera, Pteropods, and other pelagic shells. The marine fauna and flora are extensive, and have been described by Haeckel and other naturalists; it has been shown that migrations of the Red Sea and Mediterranean fauna is taking place along the Suez Canal. The origin of the name—the Lat. Mare Rubrum and the Gr. Ergythra Thalass—is much disputed. The Hebrew name is Yam Neqat, which Gesenius explains as the 'sea of reeds.' The path by which the Israelites went out of Egypt was along the course of the valley called Wady Tumeilat, apparently an old arm of the Nile now silted up. The Lake of Ismaeliah (Timsak) was then most probably the head of the Gulf of Suez, but the exact point of passage of this arm of the sea still remains obscure.

Redshank. See Sandpiper.

Redstart (Ruticilla phoenicura), a bird of the family Sylviidae, ranging in Europe from the North Cape to the wooded regions of central and southern Europe; in Asia to the valley of the Yenesi in summer, and to Palestine, Arabia, and Persia in winter; in Africa from the Canaries and Madeira and Senegal to Abyssinia in winter. In Great Britain it is a summer visitor to most parts, though unaccountably absent from some; in Ireland it has been very seldom recorded, but since the summer of 1885 it has nested annually at Power's Court, County Wicklow. The male is about 5½ inches long, has the head, back, and wing-coverts slate-gray; the forehead and eye-streak white; chin, throat, and cheeks jet black; wings brown, with pale outer edges; the tail and upper tail-coverts bright rufous chestnut; the rest of the under parts buff; bill black; legs and feet brown. The female has the upper parts grayish brown, under parts lighter, the tail less brilliant, and no bright colours on the head. The redstart is a bird of lively manners. Its food consists of flies, gnats, small butterflies, and other insects; the young are fed largely on caterpillars. The nest is built of moss and dry grass, lined with hair and feathers, in holes in trees or walls; the eggs are usually six in number, and of a light blue colour. The song is slight, but soft and melodious; the alarm note is a plaintive sweep. In some parts of the country this bird is called the 'Fire-tail,' start being derived from the Anglo-Saxon stewt, 'a tail.' The Black Redstart (R. iligus) is now a well-known visitor to many parts of the English coasts, especially of Devon and Cornwall, in autumn and winter, and also to the east and south coasts of Ireland. It is more rare in Scotland, but it has been found as far north as the Pentland Skerries. It has been recorded in Iceland, the Færoes, southern Scandinavia, and Denmark. From Holland southwards it is almost always breeding. There are other species of redstart, one (R. mosulensis) in Cyprus, Asin Minor, and Persia; another (the Indian Redstart, R. rubrifrentis) from Lebanon eastward; and a third (R. ochrurus) in the Caucasus and Armenia.

Redwing (Turdus iliacus), a species of Thrush (q.v.), well known in Britain as a winter bird of passage. It spends the summer in the northern parts of Europe and Asia; it occurs in Iceland, and struggles even to Greenland; its winter range extends to the Mediterranean, Persia, Northern India, and Siberia as far as Lake Baikal. In size it is somewhat smaller than the song-thrush or mavis. Its flight is remarkably rapid. The general colour is a rich clove-brown on the head, upper parts of the body, and tail; the wing-feathers darker, but with lighter external edges; the lower parts mostly whitish, tinged and streaked with brown; the under wing-covers and axillary feathers bright orange. The reedwing arrives in Britain rather earlier than the Fieldfare (q.v.), and, like it, congregates in large flocks, but is less numerous and less gregarious. Its food consists of insects, small snails, and berries. It has an exquisite, clear, flute-like song, which it pours forth from the summit of a high tree, gladdening the woods of the north.

Redwood. See Pine.

Reed, the common English name of certain tall grasses, growing in moist or marshy places, and having a very hard or almost woody culm. The Common Reed (Phragmites communis, formerly Arundo Phragmites) is abundant in Britain and continental Europe, in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The culms are 5 to 10 feet high, and bear at the top a large, much-branched panicle, of a reddish-brown or yellowish colour, having a shining appearance, from numerous long silky hairs which spring from the base of the spikelets. The two outer glumes are very unequal; and the spikelet contains 3 to 4 perfect florets, with a barren one at the base. The culms, or stems, are used for making garden-screen{s, for light fences, for thatching houses and farm-buildings, for making a framework to be covered with clay in partitions and floors, for battens of weavers’ shuttles, &c. So useful are reeds in these ways, and particularly for thatching, that it is found profitable in some places to plant them in old clay-pits, &c. Probably they might be planted with advantage in many pastures where they are now unknown. The plant is not very common in Scotland; but in the fenny districts of the east of England it covers large tracts called red-rooms, and similar tracts occur in many parts of Europe. Nearly allied to this is Arundo donax, the largest of European grasses, plentiful in the south of Europe, and found in marshy places as far north as the south of the Tyrol and of Switzerland. It is 6 to 12 feet high, and has very thick, hollow, woody culms, and a purplish-yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarinets, mouth-pieces of oboes, &c. They are also made into walking-sticks and fishing-rods; and see the article Writing. The creeping roots contain much farina and some sugar. Of Arundo Karka (called Sur in Sind) the flower-stalks are very fibrous; and the fibres, being partially separated by beating, are twisted into twine and ropes. The Sea Reed is Ammophila (q.v.)—or Gymno—arundinacea.

Reed. in Music, the sounding part of several instruments, such as the clarionet, bassoon, oboe, and bagpipe, so called from its being made from the outer layer of a reed (Arundo activa or donax) found in the south of Europe. The name is also applied to the speaking part of the organ, though made of metal. Reeds are generally divided into two kinds—the beating reed, used in the organ, clarionet, &c., requiring to be placed within a tube to produce a musical sound, and the free reed, used in instruments of the harmonium and concertina kind. The Organ (q.v.) reed (fig. 1) consists of a metal tube, a, with the front part cut away and having a metal (brass, German-silver, or steel) tongue, b, covering the orifice, attached at the upper end, and bent forward at the lower end to permit of vibration. The admission of a current of air to the outer tube causes the tongue to vibrate against the edge of the opening in the tube a, producing a musical note, the pitch of which is determined by the length of the free end of the reed;

![Fig. 1](image1)

![Fig. 2](image2)
centre. The air being blown into the thin end causes the two reeds to vibrate against one another. The free reed, shown in fig. 3, consists of a metal tongue, b and a flexure of one end, c, of a metal plate, a, having an elongated slot large enough to allow the free end of the tongue to vibrate freely through it on the admission of a current of air; and this vibration forms the note, the pitch of which is regulated by the length of the reed.

Reed Bird. See Bob-o-link.
Reed Mace. See Typha.
Reef. See Coral.
Reel, a lively dance, popular in Scotland, which makes use of two couples, but admits a greater number. The music is in general written in common time of four cotchets in a measure, but sometimes in jig time of six quavers.

Reels. See Bobbins.
Rees, Abraham (1743–1825), a native of Montgomeryshire, and Unitarian minister for forty years at the Old Jewry, London, compiled an Encyclopaedia (q.v.) on the basis of Eqn. Chambers'.
Reeve (Sax. gerefa), a title applied to several classes of old English magistrates over various territorial areas: thus, there were borough-reeves, over boroughs; port-reeves, in trading-towns, in ports, as in London (q.v.); high-reeves, &c. The Sheriff (q.v.) is the shire-reeve. The reeve in Chaucer's is what is still called grieve in Scotland, a land-steward.

Reeve, Clara, novelist, daughter of the rector of Preston in Suffolk, was born at Ipswich in 1729, lived a quiet life, and died unmarried, 3d December 1903. She translated Barbery's Arégnes (1772), and in 1777 published the Champion of the British, a Gentleman of Fashion, a year later The Old English Baron. It was dedicated to Richardson's daughter, and was avowedly an imitation of Walpole's Castle of Otranto, with its extrava-gances toned down. She published four other novels, and The Progress of Romance (1755).

Reeves, J. J., was born in 1752, and educated at Merton College, Oxford. Called to the bar about 1780, he became chief-justice of Newfound-land (1791–92), one of the king's printers (1800), a superintendent of aliens (1803–14), and law clerk to the Board of Trade, and died in 1829. He published much on law, and a widely popular edition of the Bible, with selected scholars (9 vols., 1827).

Reeves, John Sims, one of England's greatest singers, was born at Shooter's Hill, Kent, on 26th September 1818. At fourteen he was a clever performer on various instruments, and was appointed organist and director of the choir in the church of North Cray in Kent. He first appeared in public as a baritone at Newcastle in 1839. This début was a complete success; and he acquired fresh fame, but as a tenor, in London. In order to perfect his voice and style he studied at Paris (1843) for some time, and then appeared at Mihau in the tenor part of Edgardo in Lucia di Lammermoor. He returned to England in 1847, and, coming out at Drury Lane as Edgardo, was immediately recognised as the first English tenor, a position he maintained for many years. He was engaged in 1848 at Her Majesty's Theatre, and in 1851 sang as first tenor at the Italian Opera in Paris. After ceasing to sing on the stage (after 1860) he became popular all over the country as a ballad-singer at concerts. He especially excelled in singing oratorio parts, his first oratorio rôle having been in Judas Macca-beus in 1844; from that year onwards he sang almost regularly at the great annual musical festivals which were then held, and he displayed natural purity and sweetness. He made his last appearance on 11th May 1891, and died at Worthing, Sussex, 25th October 1900. See his My Jubilee (1889), and the Life by Sutherland Edwards (1881).

Reflection. See Monastery.
Refertud. See Switzerland.
Reflection, A surface on which a beam of light falls may be either rough or smooth. If it be rough, the greater part of the incident light is irregularly scattered by the irregularities of the surface, so as to be reflected or dispersed in all directions; if it be smooth, a proportion (but never the whole) of the incident light is regularly reflected or turned back in definite paths. A smooth, dustless mirror is not visible to an eye outside the track of rays reflected from it. If the surface and the air be of a transparent substance (e.g. glass) optically denser than the medium conveying the light to it, comparatively little light is reflected; but the more oblique the incidence, the smoother the polish, and the greater the difference between the optical density of the glass and that of the air (which is usually the case), the more of the beam is reflected. If the index of the glass is 1·5 and that of the air 1·0, the reflection is 84 per cent; if the index of the glass is 1·5 and that of the air 1·3, the reflection is 63 per cent. If the glass is 1·0 and the air 1·5, the beam is transmitted, the glass being optically rarer than the air. A beam of light striking an optically denser medium is refracted into the denser medium, but if it be transmitted, the beam is again reflected on the other side of the glass, and on returning to the denser medium is refracted again to its former position; thus the beam is continually reflected and refracted at the surface between the two media. If the glass be of a medium of the same index as that of the air, the beam is transmitted through the glass, and not reflected. On the other hand, if the glass be of a medium of the same index as that of the air, the beam is transmitted through the glass, and not reflected. If a beam of light be incident on a semi-transparent medium at any angle, the beam is divided into two parts; one part is transmitted through the medium, and the other part is reflected at the surface of the medium. The fraction of the beam which is reflected is called the reflectance of the surface, and the fraction of the beam which is transmitted is called the transmission of the surface. If a beam of light be incident on a semi-transparent medium at any angle, the beam is divided into two parts; one part is transmitted through the medium, and the other part is reflected at the surface of the medium. The fraction of the beam which is reflected is called the reflectance of the surface, and the fraction of the beam which is transmitted is called the transmission of the surface. The reflectance of a surface depends upon the angle of incidence, and for all but a very small angle is equal to the angular reflectance. The angular reflectance is equal to the angle of reflection (the corresponding angle between the normal and the reflected ray). These laws apply equally to ether-waves of all lengths, and therefore to light of all colours; and they also hold good whatever be the shape of the surface. If the surface be plane, the rays of the reflected beam are all parallel; and if the surface be curved we have, in effect, to consider the curved surface as made up of indefinitely small facets, to each of which the above laws can be applied. The geometrical consequences of these laws make up what we call the catoptrics, that part of geometrical optics which deals with reflection; and this coincides in its propositions with the laws of the refraction of light, and it gives us a complete theory of the phenomena of light.
with that part of kinematics which gives an account of the reflection of waves. Here the ether-waves (using the term 'waves' in its most general sense) are assumed to travel through optically homogeneous media, and can consequently be traced out by imaginary lines drawn at right angles to the wave fronts or along the directions pursued by the waves, these imaginary lines being called 'rays.'

**Plane Reflecting Surfaces.**—(1) Rays which are parallel to one another before striking a plane reflecting surface are parallel after reflection. (2) If light diverging from or converging towards a point, Q, be reflected from a plane mirror, it will appear after reflection to diverge from or converge towards a point, q, situated on the opposite side of the mirror and at an equal distance from it. In fig. 1, the rays diverge from Q; after reflection they appear to diverge from q. If, on the other hand, the course of the light is such that the rays appear before reflection to converge upon q, they will after reflection diverge from Q. (3) A consequence of the preceding proposition is that when an object is placed before a plane mirror the virtual image is of the same form and magnitude as the object, and at an equal distance from the mirror, on the other side of it. The right hand of the image, taken as looking towards the mirror, is necessarily opposite to the left hand of the object; so that no one ever sees himself in a single plane mirror as others see him or as a photograph shows him, but he sees all his features reversed. (4) When two mirrors are placed parallel to one another, light from an object between them is reflected back and forth, so as to appear on each occasion of reflection as if it came from images more and more remote from the mirrors. On each occasion the course of the ray of light is the same as if the virtual image behind the mirror had been a real object; and a new virtual image is produced, apparently as far behind the reflecting mirror as the virtual object had been in front of it. Thus, in fig. 3, where AB and CD are mirrors, the distance Q-CD = CD-q1; q1-AB = AB-q2; and so on indefinitely; and also Q-AB = AB-q; q'-CD = CD-q'; and so on indefinitely; so that if the mirrors were perfectly plane and parallel, and if they reflected all the light inclined at an angle which is some aliquot part of 180°, gives the principle of the Kaleidoscope (q.v.). (5) When a beam of light is reflected from a mirror and the mirror is turned through a given angle the reflected beam is swept through an angle twice as great. This property is utilised in the construction of many scientific instruments, in which the reflected beam of light serves as a weightless pointer, and enables us to measure the deflection of the object which carries the mirror. (6) When a beam of light is reflected at each of two mirrors inclined at a given angle the ultimate deviation of the beam is (if the whole path of the light be within one plane) equal to twice the angle between the mirrors; for example, in fig. 4, the angle SDB, which measures the ultimate deviation of the original beam SA, is easily proved equal to twice the angle BCA between the two mirrors. This proposition is applied in the Quadrant (q.v.) and in the Sextant (q.v.). (7) When a wave of any length is reflected at a plane surface it retains after reflection the form which it would have assumed but for the reflection, this form being, however, guided by reflection into a different direction.

**Curved Reflecting Surfaces.**—In these we have to trace out the mode of reflection of incident rays from each 'element' or little bit of the reflecting surface; and this leads, through geometrical working, to such propositions as the following: (1) Parallel rays, SP, travelling parallel to the axis of a concave paraboloid mirror (fig. 5) are made to converge so as all actually to pass accurately through F, the geometrical focus of the paraboloid; and, conversely, if the source of light be at F, the rays reflected from the mirror emerge parallel to one another—a proposition of great utility in light in the work, search-lights, &c. (2) If the paraboloid mirror be convex, parallel incident rays have, after reflection, the same course as if they had come from the geometrical focus of the paraboloid. (3) In a concave ellipsoid mirror, light diverging from one 'focus' of the ellipsoid is reflected so as to converge upon the other 'focus' of the curved surface; and by a convex ellipsoid mirror light converging towards the one focus is made to diverge as if it had come directly from the other focus. (4) In a hyperboloid reflector the two geometrical foci have properties corresponding to those of the ellipsoid. (5) In spherical reflectors, which are those most easily made, there is no accurate focus except for rays proceeding from the centre and returning to it. When parallel rays are incident on a
converging spherical mirror we see from fig. 6 that if they be parallel to the axis, the reflected rays are made to pass after reflection through a point, q, which is nearer to F (a point midway between the mirror and its centre, O) the narrower is the pencil of rays. If, therefore, the pencil of rays be very narrow in comparison with the radius, OA, the rays will after reflection be approximately converged upon F, which is called the principal focus of the mirror; and the principal focal distance, AF = tAO = yr, where r is the radius of the spherical mirror. The farther any ray is from the axis AO, the farther from F is the point, q, to which that ray is reflected; the difference, pq, is called the longitudinal aberration for that ray. The reflected rays from the various parts of the mirror form by their intersection a Caustic (q.v.), the apex or cusp of which is at F.

If, instead of using a parallel beam of incident light, we have light coming from a point at a definite distance along the line of sight, we find (see fig. 7) first that any ray from Q to A travels back along AO, whence the focus of reflection is coincident with the point AO; and that any ray, QP, is reflected to a point, q, such that the angle QPQ = qPO; and therefore (since by Euclid, vi. 3, QO = qO) QP = qP. If the pencil be relatively very narrow, so that QP becomes equal to QA, and qP to qA, we have QO = qO: QA = qA. This proportion reduces to the equation 1/Aq + 1/AQ = 2/AO; whence we can readily find Ay when AQ and AO are known. Thus, if, for example, the radius of curvature AB be 12 inches (the principal focal length being then 6 inches), and if Q be 30 inches from A, we have 1/Aq + 1/30 = 2/12; whence 1/Aq = 8/60 and Aq = 74 inches. The same formula may be written 1/d + 1/d' = 1/f, where d and d' are the distances from A of the two 'conjugate' foci, pq and q, and f is the principal focal length. The two 'conjugate' foci are reciprocal; if light start from q it will be reflected to Q. As Q, the source of light, approaches Q, q also approaches Q; when Q is at 0, q also is at 0; as Q continues to move towards F, q moves out more and more rapidly beyond Q, until when Q is at F, q is at an infinite distance, or the reflected rays are parallel; when Q is between F and A the reflected rays are divergent, as if from a virtual focus on the opposite side of A. If the mirror be convex, fig. 8 shows that AO and AQ have, with respect to the surface, opposite signs; so also have AO and AQ; so the equation above becomes 1/Aq + 1/AQ = 1/AO; whence, taking the same numbers as before, Ay is equal to or 5 inches; a virtual focus lying to the right 5 inches from a point 5 inches on the other side of the reflecting surface.

As to the quality of the light reflected there are some peculiarities to be observed. From the surface of a transparent body, of greater optical density than the surrounding medium, light polarised in the plane of incidence and reflection is more largely reflected at oblique incidences than light polarised at right angles to that plane; when the angle of incidence is such that the reflected and refracted rays tend to be at right angles to the whole of the plane of incidence. Light reflected is polarised in the plane of incidence and reflection; and if light polarised at right angles to that plane be made to fall upon glass at the particular angle of incidence just referred to, it will not be reflected at all, but will wholly enter the glass. Plane-polarised Light polarised in some other plane than that of incidence or one at right angles to it, is, after total reflection in glass, found to be elliptically polarised (see POLARISATION); and this phenomenon is always presented in reflection from metals. In the case of electro-magnetic phenomena light is polarised in consequence of the electric and magnetic forces concur in indicating that conductors are good while non-conductors are bad reflectors; and the same general proposition holds with reference to those more frequent but otherwise similar ether-oscillations to which the phenomena of Radiant Heat, Light, and Electricity are due.

**Reflex Action.** See Nervous System.

**Reform** is a comprehensive name for those changes in the law by which the House of Commons has been made a truly representative body. In the 18th century the only elections were in county elections; in many boroughs the franchise was restricted to members of the corporation; boroughs of this class were usually under the influence of the crown or of some wealthy individual who regarded them as a part of his property. In 1745 Sir F. Dashwood moved an amendment to the address, claiming for the people the right to be freely and fairly represented; in 1766 Lord Chatham took up the cause of Reform; Wilkes proposed an excellent scheme of redistribution in 1776; in 1780 the Duke of Richmond proposed annual parliaments, and electoral districts, but his plan met with no support. Pitt entered public life as an avowed reformer, and in 1783 he introduced a measure of redistribution; the part of his scheme most open to objection was the proposal to compensate owners of rotten boroughs. His bill was rejected, and he dropped the subject. The king was pressed to change, and in the public mind reform came to be identified with the revolutionary opinions which were beginning to prevail in France. Fox and Grey kept alive the demand for a wider franchise and a better distribution of power. In 1815 the Whig friends of reform found an able leader in Lord J. Russell. His first motion on the subject was proposed in 1820, and in 1830 he accepted office under Lord Grey. A Reform Bill was brought in, and the second reading was carried by a majority of one. A subsequent defeat in committee compelled the government to dissolve. The country declared unmistakably for Lord Grey; his second Reform Bill was passed in the Commons by a large majority. It was rejected by the Lords, and the same fate would have befallen a third bill introduced in 1832, but at the request of the Lords the king declared the threat to create as many new peers as might be necessary to pass the bill. After something like a century of discussion the first Reform Act received the royal assent. The greater part of the labouring classes were still unenfranchised; the Radical reformers continued to agitate; the Whigs and Tories were unwilling to disturb the settlement of 1832. Agitation was stimulated by the so-called People's Charter put forth in 1838; but it was not till 1832 that Lord J. Russell reopened the question of Reform. Successive governments continued to consider it, and after 16 years past, Lord Derby and Mr Disraeli succeeded in passing the act by which household and lodger franchises were extended to the boroughs. In 1884 Mr Gladstone proposed to assimilate the franchise in counties to
that which had been given to the boroughs; but the Lords refused to pass any bill for ending the franchise until the details of the government scheme of redistribution were before them. The action of the Lords led to considerable agitation in the autumn recess. The bill was re-introduced in an autumn session; and the question at issue between the two Houses of Parliament was whether the government should accept a compromise with the subjects, or whether it should reject all compromise and persevere in its programme. The government agreed not only to communicate their plan of redistribution to the leaders of the opposition, but to settle the details by mutual arrangement; Lord Salisbury and Sir S. Northcote attended meetings of the cabinet, and conferred with ministers for this purpose. The results of this conference were embodied in a series of bills which were passed into law before the general election of 1885. Two points in the measures of 1884–85 have been somewhat severely criticised—the adoption of single-member districts, and the office of Municipal Register, which suppresses the opinions of all local minorities (see REPRESENTATION), and the addition of twelve members to the House of Commons, which was already too large a body for deliberative purposes. At the end of the reign of George III. there were, in a population of 22,000,000, only 440,000 voters. The Reform Bill of 1832 added less than 500,000 voters to the electorate; the reform of 1867–68 increased the electorate from 1,136,000 to 2,445,000. At the passing of the measures of 1884–85 the electorate had by natural growth risen to about 3,000,000; and the Act of 1884 added at once about 2,000,000 more to the list of voters. Of the new electors, about 1,300,000 were in England and Wales, 200,000 in Scotland, and 400,000 in Ireland.

See the articles Parliament, Chartism, Gladstone, Russell (Earl); Monarchical History; and the speeches of Gladstone, Bright, Disraeli, &c.

Reformation. The religious revolution of the 16th century, known as the Reformation, is the greatest event in the history of civilization since Paganism gave place to Christianity as the faith of the leading nations of the world. It marks the supreme importance of this revolution that the age which preceded and the age which followed it belongs to two different phases of the human spirit. With the Reformation begins what is distinctively known as Modern Europe, while the epoch that precedes it bears the distinctive designation of the Middle Ages. As a revolution in which all the countries of western Europe were more or less directly involved, the subject of the Reformation has necessarily been treated in the different accounts of these countries. In the articles on Luther, Charles V., Henry VIII., Calvin, Knox, and others further details will be found regarding the aims and methods of the revolution in the various countries where it declared itself. Here, therefore, it will be sufficient to indicate briefly the general causes which produced it, the special countries which took an active part, the different peoples, and its chief results for the human spirit at large.

The central fact of the Reformation was the detachment from papal Christianity of the nations disposed to follow Germany into Protestantism. By this severance an order of things came to an end under which Christian Europe had been content to exist from the close of the 8th century. From the year 800, when, by a mutual understanding of their respective functions, Charlemagne was crowned emperor of the Romans by Pope Leo III., western Europe had come to regard the papacy as the essential condition of individual and corporate life, as prime a necessity in human affairs as the sun in the course of nature. Thus conceived, the power of the church underlay all human relations. It was the consecration of the church that constituted the family; the church defined the relations of rulers and their subjects, and the church was the final court of appeal on the ultimate questions of human life and destiny. In the nature of things such a power could never be realised as it was ideally conceived. Yet during the 11th and 12th centuries, the period when the power of the church was at its height, works were put forward to show that the claims, they undoubtedly went far to make the idea a reality. But the energies of the human spirit were bound sooner or later to issue in developments with which medieval conceptions were fundamentally irreconcilable. By the 13th century, along every line of man’s activity, there were already protest, conscious and unconscious, against the system typified in the pope at Rome. The most remarkable of these protests was the order of ideas associated with the name of John Huss of Flora in Calabria (died 1419). Under the name of the ‘Eternal law’ (letter by James Tyrie, a Scottish Jesuit) claims John of Flora as an ally in the work which it was the labour of his own life to achieve—the ruin of the papacy, and the promotion of what he deemed a purer gospel.

Simultaneously with this manifestation of revolutionary energy there was another movement in the sphere of pure thought in essential antagonism to the teaching of the church. The labour of the thinkers of the middle ages was to reconcile faith, as incarnated by religious authority, with human reason as they found it embodied in the accessible writings of Aristotle. In the 13th century, however, the Arabic texts of Aristotle, and notably that of the great commentator Averroes, made their way into the Christian schools, and thenceforward a leaven of scepticism was a present element in all the universities of Europe. As the result of the teaching of Averroes, a name of the most sinister import to every true son of the church, materialism and pantheism became common creeds among thinkers, and the notion spread even among intelligent laity that Christianity was not the absolute truth, but a vehicle for them to believe. In Dante’s (died 1321) fierce exclamation that the knife is the one reply to him who denies the immortality of the soul we have the outburst of a passionate faith in presence of a widespread libertinism of thought.

But the most serious menace against the integrity of the papal system lay in the political development of Europe during the last three centuries of the middle ages. As the countries of western Europe became more and more individualised, their peoples grew every year into a fuller consciousness of distinct national interests and national ideals. While
The very zeal with which the revival of antiquity was pursued in Italy was itself a countercheck to religious reform in the country that of all others needed it the most. All contemporary literature proves that during the later part of the 15th and the opening of the 16th century, there was as profoundly immoral as that of any of the heathen emperors that had been in the same city. The spiritual claims of the papacy were the jest of ecclesiastics themselves. 'This fable of Christ,' a certain dignitary of the church is reported to have said in Italy, 'has been to us a source of great gain.' Among the Italian people, however, there was never the slightest indication of a national movement towards any serious breach with the papacy. The religious melodrama enacted by Savonarola at Florence (1497-98) never struck at the central ideas of papal Christianity; and Savonarola, besides, never like Luther or Knox woke a deep response in the national consciousness. While in Italy, therefore, there was no widespread religious quickening as in other countries of Christendom, there was no political movement which in any way produced such a profound effect with the papacy. For the Italian people the pope was not a foreign prince with temporal interests of his own conflicting with those of the nation at large. The different republics which partitioned the country might at times regard the papal territory as a menace to their own supremacy, but the nation as a whole was fully conscious of the honour of having the vicar of God in their midst, and as in the past they had stood by him against the emperors, so in the great religious revolution of the 16th century they also remained faithful to him through the gradual dismemberment of his spiritual dominion.

Of the countries north of the Alps Germany was the first to be widely influenced by that revival of learning which had its origin in Italy. In Germany, however, the new spirit sought under fundamentally different conditions, and lighted the way to vastly different issues. There was every reason why Germany should lead the way in the schism from Rome. Outside Italy Germany was the country where every abuse of the medieval clergy was felt with the deepest audacity. The ignorance and sensuality of the clergy, the scandalous sale of livings, the disproportionate papal exactions—all these evils came to be vividly realised by the quickened consciousness of the nation. Between Rome and Germany, moreover, an antagonism existed in the very conditions from which mediavilism had sprung. It was in virtue of the mutual understanding between pope and emperor that the church came to fill the place it did in western Europe. But almost from the first the interests of Rome and the empire had been in collision, so that pope and emperor came to be mere rivals for the first place among the western powers. It was natural, therefore, that in Germany Rome should be regarded with a jealousy and suspicion which might easily grow into irreconcilable hostility.

These workings of the national mind found intensified expression in the acts and writings of Martin Luther, who, with a genius and audacity which have given him a place among the moulders of man's destinies, proclaimed the need of a new departure in the religious life of humanity. In rejecting the exercise of spiritual disintegration, the two results of the revival of the ancient literatures. In so many words he states his grave fears lest the church should be wholly pagannised by the universal imitation of classical modes of thought and speech; while his own unswerving criticism of the church and its traditions proves how much he owed to the so-called 'new learning.'
the Reformation and new elements in the life of European nations.

The religious revolt in Switzerland is second only to that of Germany in its direct influence on the subsequent fortunes of the European nations. In Switzerland we have the case of a double revolt from Rome springing from the same conditions, yet each having a character and an animating soul of its own. The first was the attempt to renew, independently of Luther, Ulrich Zwingli, who, according to Ranke, combined in himself the best elements of renaissance and reform, gave rise to a movement which split the Swiss cantons into two hostile sections, and issued in the peace of Coipel (1538), by which the Swiss Cantons, never in the choice of its own form of faith. More important than the movement of Zwingli at Zurich is that associated with Calvin and Geneva. As in almost every other case of revolt, political considerations wrought with religious zeal in the breach of Geneva with Rome. In 1536 the town had received the new religion from French refugees, who thus gave its peculiar character to the creed eventually associated with Calvin and Geneva. But it was in the successful effort of the town in throwing off the yoke of the Catholic Dykes of Savoy (1534) that it found itself forced to join the great Protestant schism, and to fashion a civil and religious polity compatible with an independent corporate life. It was in the accomplishment of this task that Calvin proved himself the great consolidator of the ten- dency to political freedom. Inspired by Calvin, it was the pre- eminent destiny of Geneva at once to produce a reasoned civil and religious creed and a type of Christian believer that offered a solid front against the vast powers still at the command of the Roman see, and most drastic measures against it. By the end of the 16th century, also, the Renaissance, which was everywhere the solvent of tradition, had found its

with pope and priest, and in this had lain the essential principle of medieval Christianity. By the new principle Luther made the pope no longer an indispensable factor in individual or corporate life, and thus initiated a new phase in the development of society. As was to be expected, this principle, which was so revolutionary in its working, came the German nation in twain, and gave rise to a struggle which did not close till more than a century after the death of Luther himself. Luther’s attack on the sale of indulgences (1517), the burning of the papal bull (1520), Luther’s condemnation (1521) by the Emperor of the Church of Worms (1521), his temporary triumph at the first diet of Spires in 1526 (the beginning of modern Germany, according to Ranke), the confession of the Protestant faith at Augsburg (1530), are the outstanding events in the contest closed by the peace of Augsburg in 1555, nine years after Luther’s own death, but again renewed in the disastrous Thirty Years’ War (1619-48), and finally settled by the peace of Westphalia (1648).

The religious revolt of Germany led no country of Europe. But the 16th century had closed the bulk of the Teutonic peoples had followed her example and broken with the papacy. Under one aspect, indeed, the Reformation may almost be regarded as a Teutonic revolt against the domination of the Latin races. Between 1525 and 1555, in nearly every section of the dominions of a political revolution, both declared for Prot- estants; and in 1581 the United Provinces definitively threw off their double allegiance to Spain and the pope. But it is more important to trace the course of the revolution in the great powers of the West. In Spain heresy of all kinds had no chance of finding a home. In its terrible Inquisition, re- organised in 1478, it had an institution ready made for effectually dealing with all attempts at reform or revolution. Luther found followers in Spain as in other countries; they were literally extin- guished before their voices could be heard, and of all the great powers Spain profited least by the quickening spirit of the Reformation.

Much more interesting and important is the history of the religious revolt in France. Between 1529 and 1530, the period of Luther’s greatest activity, both renaissance and reform found a firm footing in France, and so many circumstances seemed to favour the future of both that for a time it was doubtful which side the victory would eventu- ally befall. The University of Paris, which throughout the middle ages had claimed for itself the right—denied to the pope himself—of sovereign decree on the truth or falsity of all religious doctrine. As its decrees had in every case the strenuous support of the parliament of Paris, the university was a formidable force to be reckoned with by every innovator in studies or religion. In 1519 Luther’s dispute with Eck had been referred to the doctors of Paris for decision, and their judgment, delayed for two years, had been the unqualified censure of Luther’s position. Thus Luther was the only standard of the true religion and they daily grew in numbers, especially among the middle class, both in Paris and in the provinces, was pursued by the unrelenting hate of the parlia- ment and the university. On the other hand, the king himself (1521) permitted that his favorite sister, Marguerite de Navarre, who herself had strong Protestant leanings, was at first disposed to use the new religious movement as a weapon to his hand in his dealings with the court of Rome. In the end Francis saw that separation from Rome meant the disruption of the French nation, and after 1534 he resolutely set himself to the exter- mination of every heretic in his dominions. His son and successor, Henry II. (1547-50), carried out this policy with even greater rigour, but in spite of all efforts to suppress them the French Protestants grew into a body formidable alike by their position, wealth, and intelligence. The Huguenot wars, the Massacre of St. Bartholomew (1572), the Edict of Nantes (1598) are the outstanding events in this long struggle, which, involving political as well as religious questions of the first importance, threat- ened the very existence of France by suggesting to Philip II. the possibility of annexing the divided country as a base for a European conquest. Under the Edict of Nantes the French Protestants attained a certain measure of religious freedom; by its revocation in 1685 Protestantism was stamped out of the country, and France thus deprived of the noblest elements in its society.

The religious revolution in Switzerland is second only to that of Germany in its direct influence on the subsequent fortunes of the European nations. In Switzerland we have the case of a double revolt from Rome springing from the same conditions, yet each having a character and an animating soul of its own. The first was the attempt to renew, independently of Luther, Ulrich Zwingli, who, according to Ranke, combined in himself the best elements of renaissance and reform, gave rise to a movement which split the Swiss cantons into two hostile sections, and issued in the peace of Coipel (1538), by which the Swiss Cantons, never in the choice of its own form of faith. More important than the movement of Zwingli at Zurich is that associated with Calvin and Geneva. As in almost every other case of revolt, political considerations wrought with religious zeal in the breach of Geneva with Rome. In 1536 the town had received the new religion from French refugees, who thus gave its peculiar character to the creed eventually associated with Calvin and Geneva. But it was in the successful effort of the town in throwing off the yoke of the Catholic Dykes of Savoy (1534) that it found itself forced to join the great Protestant schism, and to fashion a civil and religious polity compatible with an independent corporate life. It was in the accomplishment of this task that Calvin proved himself the great consolidator of the ten- dency to political freedom. Inspired by Calvin, it was the pre- eminent destiny of Geneva at once to produce a reasoned civil and religious creed and a type of Christian believer that offered a solid front against the vast powers still at the command of the Roman see, and most drastic measures against it. By the end of the 16th century, also, the Renaissance, which was everywhere the solvent of tradition, had found its
representatives in England. Linares, Grocyn, Colet, and Sir Thomas More were all men more or less emanated from medievalism, though none of them was a universalist. But both Colet and Colet spoke their minds freely on the unhappy lives of the clergy; and the latter by his foundation of St Paul's School in 1510, and by his placing it under lay supervision, took a step of the highest importance in the direction of the new order. But it is in the political development of England that we find the adequate explanation of her final breach with Rome. For centuries the pope had come to be more and more regarded as a foreign prince, whose powers, as he claimed the right to exercise them over Englishmen and English places, were opposed to the highest interests of the nationality and English liberty. Moreover, by the date of Henry's accession the pope was a mere Italian prince, whose own interests led him to seek the support of the strongest arm. When Clement VII, therefore, declared against the divorces from Catherine, Henry regarded the decision not as the oracle of Christendom, but as the counsel of an earthly prince whose own interests left him no other alternative.

The breach with Rome was thus inevitable; but it still remained to be settled whether the old or the new ecclesiastical government should control the English people. Henry himself to the close of his life professed to have broken with the old only in the point of the headship of the church. In the reign of Edward VI a clear departure was made from the doctrinal system of the ancient church; but the temporary reaction under Mary showed how strongly the hold system still possessed on the hearts of the people. When Elizabeth came to the throne in 1558 it was only her prudent policy that saved the country from the interlaced divisions of France and Germany. Three parties were equally bent on realising their own conceptions of a religious settlement. The adherents of the old religion, who still probably made a half of the people, had not lost hope of a return to the old spiritual allegiance. Those who had renounced the papacy themselves made two distinct parties, each bent on the establishment of a new form of worship. Thus it was for the first time that they could never work in common. The governing principle of the one party, from which eventually sprang the Church of England, was to minimise the differences between the old faith and the new, and as far as possible to maintain the continuity of the religious traditions of the country. The other, which drew its inspiration from Calvin and Geneva, and was afterwards known as the Puritan party, aimed at a root and branch rejection of papal Christianity as at once in the interest of what they thought a purer creed, and as the only safeguard against a return to the old constitution. It was owing to her politic handling of these conflicting parties that at Elizabeth's death England was of one mind regarding the question of the papal supremacy, and that the severance from Rome became a definite fact in the development of the country. By happy turns of events, such as her excommunication by Pius V. in 1570, and by the extraordinary issue of the Spanish Armada in 1588, not only was the number of Catholics reduced, but such as still clung to the ancient faith thenceforward put their allegiance to their national Church. It was this final triumph of the Protestant revolution in England that saved the movement in all the other countries of Europe.

The triumph of the Protestant movement in Scotland is likewise a fact of the first importance in European history. In Scotland, from the very beginning of Luther's revolt, we find the presence of the same elements which elsewhere led to revolution. As in other countries, the Scottish clergy had lost the respect of the country. As early as 1525 Lutheran books were so widely read that an excommunication was no adequate sentence for their importation. The very efforts of the church to stamp out the new heresy, as in the burning of Patrick Hamilton in 1528, and of George Wishart in 1546, served only to hasten the turn of affairs which it had dreaded. Jealousy of the wealth and political influence of the clergy disposed the nobility to throw in their lot with the party of revolution. When in 1559 Knox returned from his long sojourn abroad, his unflinching zeal and personal force supplied the momentum that was needed to complete a revolution already in full progress. The strong interest which Protestantism was formally established as the religion of the country. The consequences of this revolution extended far beyond Scotland. Had Mary on her return in 1561 found Scotland united in the Catholic faith, she would have commanded the destinies of England. Elizabeth could never have effected a religious settlement, and, with England paralysed, Protestantism could not have held its own against the united forces of Catholicism.

Thus, by the middle of the 16th century, it seemed as if the revolution must sweep all before it, and the papal system be as completely effaced by Protestantism as Paganism had been effaced by Christianity. At the beginning of the revolt the authorities of the ancient church did not fully realise that the forces arrayed against them menaced their very existence. When the true extent of the danger was realised the church displayed all the resources of an institution whose roots were in the very heart of Christendom, and which, alike by its traditions and by its special adaptations to the wants of the human spirit, appealed to the deepest instincts of a large section of all the peoples of western Europe. The Society of Jesus, founded in 1540, supplied an army of enthusiasts, whose policy and devotion saved Rome from dissolution. By the decree of the Council of Trent (1545-63), inspired by the spirit and aims of the Jesuits, the Roman Church undertook to teach, conceding nothing either to renaissance or reform; and a succession of popes during the later half of the 16th century carried out with a zeal worthy of the better ages of the papacy the policy marked out for them by the Jesuits. Throughout the greater part of the country where the Counter Reformation was most strenuous efforts of the papacy, the middle of the 16th century saw the tide of revolution checked; and in certain countries, more especially in Germany, the Jesuits even gained ground which had been lost. By the close of the same century Europe was partitioned between the two religious almost by the same dividing lines as exist at the present day.

It has been said that the central fact of the religious revolution of the 16th century was the secession of the Protestant nations from the Roman see; but the great schism inevitably led to issues of which the Protestant reformers never dreamed, and which they would have denounced in as unqualified terms as any theologian of the medieval church. The reform of religion preached by Luther or Calvin implied no real change in the modes of thought and feeling of the people. The reformation of scholasticism was but another form of scholasticism; their attitude to the classical tradition or to any departure from their own conception of the scheme of things was precisely that of the Schoolmen trained on the Decretals and Aristotle. For an attitude which was their own unerring expression of God's relations to man; the interpretation of the Bible they left to the indi-
vital consciousness. This freedom was of necessity only nominal, since the members of any Protestant church were members only on condition of their accepting the church's interpretation of the contents of the Bible, and since each different church deemed itself the special depository of the only true conception of the perfect will of God. Nevertheless, it was in the middle of the 18th century that the spirit of the Reformation was applied to the middle ages. In the medieval conception church and state made one organism; what menaced the life of the one menaced the life of the other. Hence the state had to be in charge of the prison. It was only in the 18th century that anything resembling a reformatory was established. The 19th century, however, was one of rapid and far-reaching changes in the whole system of government and administration; and the new ideas could not be expected to be put into operation only in obedience to the political views of the day. But the new system could not be made to suit the existing views. The older system of imprisonment and the system of transportation were both abolished. The new system was one of reform, and the reformatory system was a part of it. 

Reformatory and Industrial Schools. When the time arrived that statesmen and reformers combined to study the causes of crime with the view to systematic efforts for its repression, it soon became evident that the most effective method would be to check the first development of it in the young. Close observers agreed in the fact that by far the larger number of habitual criminals commenced their malpractices before they were seven years old, and nearly 60 per cent. when under fifteen. Hanging and imprisoning did not check the growth of the class of juvenile criminals. In the early part of the 19th century there were said to be in London two hundred flash houses frequented by 6000 boys, the majority of whom were not even acquainted with the Bible that the developments of modern thought sprang from. A reformer like John Knox would have stamped out every form of thought hostile to his own synthesis of things divine and human; but it was not in the nature of the Reformation to have been so effectually done by the church of the middle ages. In the medieval conception church and state made one organism; what menaced the life of the one menaced the life of the other. Hence the state had to be in charge of the prison. It was only in the 18th century that anything resembling a reformatory was established. But the new system could not be made to suit the existing views. The older system of imprisonment and the system of transportation were both abolished. The new system was one of reform, and the reformatory system was a part of it.
REFORMATORIES AND INDUSTRIAL SCHOOLS

for its being removed to such school if not originally committed to it. No school can be compelled to receive a child. The selection of the school is in practice generally a matter which the governor of the prison arranges with the managers after the sentence of the child, and with the consent of the local authority, has a general agreement with some school.

A reformatory may be established wholly by private individuals, or by quarter sessions in counties, or by town-councils in quarter sessions boroughs, or by private individuals with contributions from local authorities. The state provides no reformatories, and the local authorities are not obliged to do so. Plans of any buildings proposed to be used as a reformatory must be submitted to and approved by the Secretary of State. The rules of such reformatories must be laid on the managers, but must be submitted to and approved by the Secretary of State. The expenses of maintaining the reformatory are met partly by private contributions, partly from local rates, partly from funds provided by the Treasury, and partly by pay-roll expenses of the parents. The latter is the largest item of expense. In 1890, the cost of the reformatory schools was £2619. The following is a list of the reformatory schools in Great Britain, including fifteen ships, and these ten were in Scotland. There were seven in Ireland.

The reformatory system in Great Britain is the following. In 1856, twenty-nine children were committed to reformatory schools in England; in 1857, 1304; in 1877, the largest number recorded—viz. 1890; and in 1890, 1290. The total population of the reformatory schools in Great Britain seems to have risen gradually until 1881, when it attained its maximum—viz. 6738; since which it has fallen gradually, and on 31st December 1890 there were under detention 5031 males and 823 females, or together 5854, of whom 4164 males and 737 females were actually in the schools, the remainder being mostly on furloughs. In 1881, 528 had absconded, or were in prison. The cost of these schools in the latter year was £119,336, of which £78,802 was provided by the Treasury, £5488 by the parents, £24,035 by local rates, £2793 by subscriptions and legacies, £799 by voluntary associations, and £2019 interest on local and industrial school funds. The remaining balance of expenditure over receipts of £5519; and, as the inspector's report shows that there was a profit on industrial operations of over £13,416, it is presumed that the deficiency was supplied from that source. The net cost per head in 1890 was £7, of which 28p 3½d. was by the Treasury, 23p 2½d. by the parents, 13½d. by the local rate, 5½d. by subscriptions and legacies, 4½d. by voluntary associations, and 1½d. 3¼d. by the local industrial schools. The number of inmates under detention in 1890 was 5673, of whom 4250 were boys and 1423 were girls. The number of admissions exceeds the number released, but the difference is mostly due to the partial discharge of boys before the age of fourteen, and cannot be detained above the age of sixteen. The circumstances which justify a magistrate committing a child to an industrial school are—If he has been found begging, wandering without settled abode or proper guardianship, and manual work, and who is destitute, an orphan, or having a surviving parent in prison, whose mother has been twice convicted of crime; or if the child under twelve is charged with a punishable offence, but has not previously been convicted of a felony, and in any case must be sent to a reformatory on the application of its parent or guardian; a reformatory pauper child, or one either of whose parents has been convicted, may also be sent to an industrial school.

The Education Act, 1876, requires the school authority to take all necessary steps to arrange that the attendance of all boys and girls who are liable to be sent for the above reasons, unless it is in any case inexpedient, and further requires it to apply to justices for orders compelling the attendance of children over five and under fourteen whose education is substantially neglected by their parents, and authorises the commitment of such children to an industrial school.

Day industrial schools, in which, as their name implies, children can be trained and fed, but not lodged, were authorised by the same act. The number of children committed to these industrial schools for the industrial school, consists of two cases, and a child may be licensed from an industrial school as from a reformatory. So also are the provisions for meeting the expenses of these schools. The report for 1890 of the inspector of reformatory and industrial schools shows that all are now in Great Britain 141 industrial school for board cases, and 388 industrial school for school board cases, and 19 day industrial schools. Of these 7 are established by county authorities, 1 by the corporation of Birmingham, and school boards manage 6, besides the truant schools and day industrial schools.

The following table shows the number of children by the number under detention in each year to be in the direction of steady increase. In 1864, 1668 children were under detention; in 1890 this had risen to 22,735. These figures include the truant schools, but do not include the day industrial schools, which commenced in 1872 with 287 scholars, and in 1890 had 3698. The number of admissions corresponds in steadiness of increase with the foregoing figures. In 1861, 608 boys and 406 girls were admitted; in 1862, 422 boys and 169 girls; in 1866, the year of the consolidated act, the numbers rose to 1444 boys and 539 girls; and in 1890 there were 3438 boys and 849 girls, besides 1510 to truant schools, and 2317 to day industrial schools. (A small deduction should apparently be made from these figures for transfers.) The foregoing figures giving the number under detention in various years which These schools, of which the Trustees contributed £104,405; the rates, £4,198; school
boards, £67,036; the parents paid £16,656, and subscriptions provided £4,489. The cost of day industrial schools rose from £3272 in 1879 to £6,538 in 1890. Of this latter sum the average for the United Kingdom was £1,271 per school, £11,960, and parents, £3,382. The total ordinary cost of a child in an industrial school ranges from £14 to nearly £18 per annum.

The statutes in force for regulating reformatory and industrial schools in Ireland differ somewhat from those in force in Britain, and in Ireland more children in proportion to population are sent to industrial schools than in Great Britain, so that the Royal Commission in 1848 reported: "It is certain that the certified industrial schools in Ireland are regarded as institutions for poor and deserted children rather than for those of a semi-criminal class, and the result of this feeling is that the managers of many of these institutions refuse to take children who have been found to have committed a criminal offence, and who might legally be convicted of that offence and sent to a reformatory. All taint of criminality having been removed from the schools, numbers of children are sent to them who do not always come under the provision of the act, and who are sent merely on the ground of destitution. There can be no doubt that many children are sent to the industrial schools in Ireland who would not be so sent in England; whilst in consequence of it it is to be apprehended that numbers of children who are proper subjects for these institutions are left on the streets as waifs and strays." There were, in Ireland, at the end of 1890, 816 children on the lists of reformatories or industrial schools (a decrease as compared with the previous year), of whom 744 were actually in school. There were 8909 children on the rolls of the industrial schools (an increase on the previous year), of whom 7767 were actually in school—the remainder mostly on license. The nominal cost in Ireland was £17,190 in 1890, of which imperial taxes bore £11,890, local taxes £5318; and the industrial schools, £158,274, of which imperial taxes bore £95,842, local taxes £57,262, a decrease of cost compared with the previous year for reformatory schools of £23,700.

The most famous of the continental reformatories is that at Mettray, about 5 miles from Tours. The 'Colony,' as it was called, was established in 1839 by M. DeNizet, a French magistrate and philanthropist, in conjunction with the Vicomte Bretonniere, and the charities are 800—either orphans, foundlings, or delinquents—are taught and employed in agricultural and various industrial labours. The release into crime of those who have left the colony have amounted only to about 4 per cent. In the United States there are nearly fifty reformatories for juvenile offenders under the control of a state or city, with an average number of inmates exceeding 12,000; and the reformatory results attained are excellent. The New York House of Refuge, which dates from the year 1824, is the oldest in the United States; the reformatory for juveniles in the world which was established by law and placed under legislative control. Reformation. See ClUes, and L. Fa gan's *Reformation School (1881).*

Reformed Churches. A term employed in what may be called a conventional sense, not to designate all the churches of the Reformation, but those in which the Calvinistic doctrines have been more the Calvinistic polity prevail, in contradistinction to the Lutheran (q.v.). The influence of Calvin proved more powerful than that of Zwingli, which, however, no doubt considerably modified the views prevalent in many of these churches. The Reformed Churches are generally known on the continent of Europe as the Calvinistic Churches, whilst the name Protestant Church is in some countries almost equivalent to that of Luther.

One chief distinction of all the Reformed Churches is their doctrine of the sacrament of the Lord's Supper, characterised by the utter rejection not only of transubstantiation, but of consubstantiality; and it was on this point, mainly, that the controversy between the Lutherans and the Reformed was long carried on. See Lord's Supper, and SACRAMENT. They are also unanimous in their rejection of the use of crucifixes, and of many ceremonies retained by the Lutherans. Churches belonging to the Reformed group are those of England (in some respects) and Scotland, some churches of various parts of Germany, the Protestant Churches of France, the Netherlands, Switzerland, Hungary, Poland, &c., with those in America which have sprung from them.

See the articles Confessions of Faith, Articles, Prayer-Book, Luther, Zwingli, Calvin, Knox; and works on the distinctions between Lutheran and Reformed Churches by Schweitzer (1856), Heer (1857), Merle d'Aubigné (1861), Schmeckebier (1855).

Reformed Presbyterians. See CAMERONIANS.

Refraction. When a beam of light, travelling in a transparent medium, impinges obliquely upon the surface of another transparent medium, what occurs in the vast majority of cases is that a part of it is reflected (see REFLECTION) and a part of it enters the second medium, but in so doing it is refracted or bent out of its former course. If, for example, the light travels in air and impinge obliquely upon glass, the course of the refracted portion is bent so that the refracted light travels more directly or less obliquely through the glass; and, conversely, if the light impinges upon the air-surface, the portion which is refracted into the air will travel through the air more obliquely with respect to the refracting surface than the original light had approached it. The law of refraction was discovered by Snell in 1621, and is the following: the refracted ray is in the same plane with the incident and the reflected ray, and is therefore in the plane of incidence (see REFLECTION); and the sine of the angle of incidence bears to the sine of the angle of refraction a ratio which remains constant, for any two media, whatever be the angular incidence. In fig. 1 a ray, AO, impinges on a denser medium at O; the angle of incidence is AON (ON being at right angles to the refracting surface); the refracted ray, instead of going on towards A', is bent so as to pass through A. If AON is the angle of incidence and O'A' the angle of refraction, then sin A' = cos A; draw ec and ed' at right angles to NN'; these lines, cd and c'd', are, for the radius Oe, the sines of the respective angles AON and A'ON. These sines bear to one another a certain proportion, ascertainable by measurement; let it be 3:2; the law is that when the incident ray is refracted from B, will be so refracted that the sines, similarly drawn, will bear to one another the same proportion of 3:2. Between air and water the ratio of these sines is almost exactly 4:3; between air and
crown-glass it is nearly 3:2. Now observation shows that light passing from water into crown-glass is so refracted that the sines have the ratio $\frac{4}{4}$, or $9:8$, so that the rays are less bent than when they pass from air into any of these media.

Fig. 1.

The ratio of these sines when air is one of the pair of media involved is called the refractive index of the other medium; thus, water has, for sodium, monochromatic light and at 18° C. a refractive index of 1.3336, and crown-glass one of 1.5396; and the ratio of these refractive indices, ascertained with respect to air, governs the ratio of the sines, whether air be one of the pair of media experimented on or not. A direct consequence of this is that, if light pass successively, say, through air, glass, and water, the ultimate deviation will be the same as if the glass had been absent; and so for any number of intervening terms, it being always assumed that the bounding surfaces are parallel to one another; and if a parallel beam of light, passing through air, come to traverse any number of parallel refracting-surfaces, and if it regain the air, it will be found to travel parallel to, if not directly in, its original course.

The observed fact that light is differently bent in its course by different refracting media shows that there is a difference between bodies in their power of receiving light through their bounding surfaces. Newton, in accordance with his corpuscular theory (see Light), interpreted this as showing that when the luminous corpuscles come very near the surface of a denser substance they are as it were jerked or made to swerve out of an oblique path and hurried in by the attraction of the denser substance so as to enter that substance more directly; and that when the light quits the denser substance it is retarded by a similar attraction. The consequence of this would be that light would travel in the denser medium perhaps not appreciably faster than in air, but with a mean velocity certainly not less. On the undulatory theory, however, refraction is a necessary consequence of a slower travel of ether-disturbances in the denser medium.

In fig. 2 A is a plane wave-front, advancing obliquely towards B, the surface of a denser medium. At the end of a certain time the wave-front is at A'; after an equal interval it is at A". During the next equal interval a gradually diminishing breadth of the wave is traversing the original medium with the original velocity; but a steady widening portion of the wave-front enters the denser medium and is there hampered. At the end of the interval the aggregate disturbance, that is to say, the wave-front, will be found to have swung round into the position and direction represented by $\alpha$, just as a line of soldiers would tend to do on obliquely entering more difficult ground. During the next equal interval the wave-front advances parallel to itself, but traverses smaller distances in equal times, so that $\alpha\alpha'$ is less than $A'A"$. To this explanation it is essential that in optically denser media light should travel more slowly; and it has been absolutely established that this is the case. Optical density, so called, does not, however, always coincide with mass-density: bismuth of carbon, which is lighter than glass, has for sodium light a refractive index of 1.63, while crown-glass has an index about 1.5, and flint-glass one about 1.6. If the course of any ray between any two points in the two respective media be studied, it will be found that no other path between the two points could have been traversed in so short a time.

If we go back to fig. 1, and assume the rays to pass from $A', B', \&c.$ towards O, we find the rays emerging from the denser medium more nearly parallel to $SS'$; a ray from $C'$, so far as it is refracted at all, emerges parallel to $SS'$; and for rays approaching O from points between C and $S'$ the construction for the refracted ray becomes impossible. The angle $C'O'N$ is the critical angle, beyond which there is no refraction, but total reflection (see Reflection). This angle is such that its sine is equal to $\frac{1}{\mu}$, where $\mu$ is the ratio between the refractive indices of the denser and the rarer medium. For water and air it is, for sodium monochromatic light, 48° 27' 40". Where this ratio $\mu$ (the "relative index of refraction") is high, this critical angle is small and total reflection is well marked, as in the sparkle of the diamond.

When a spherical wave impinges on a plane surface it is modified into a hyperboloid, the centre of curvature of the central portion of which is farther away than or nearer than the centre of the sphere in the ratio of the refractive index of the second medium to that of the first. An eye within a rarer medium will thus see the image of a point situated within the denser medium as if it were nearer than it really is; hence a stick appears bent when partly immersed obliquely in water; and, owing to differences in the amount of refraction at different angles, the bottom of a tank looked down upon appears sunk in the middle.

In fig. 3 light starts from a point $X$, and impinges directly upon a spherical surface of a denser medium; the centre of curvature of the spherical surface is at C. During a certain interval of time the front of the wave advances from $A'$ to $A$; during the next equal interval it would, but for the denser
medium, have been at BRD. It has not, however, got so far as R in the time; the central part of the wave-front has only got as far as R', where AR : AR' = μ : 1. Any non-axial ray, such as XP, which would have reached Q, can only have originated a disturbance at P, which would have travelled from P in some direction to a distance not equal to PQ, but to PQ reduced in the same ratio of \( \mu : 1 \). We might then, knowing \( \mu \), the relative index of refraction of the denser medium, draw, with centre P and radius = PQ + \( \mu \), an arc of a circle; the disturbance will have got to some point on that circle. Doing the same for all the P's, we have a series of circular arcs which may be connected by a line drawn so as to touch them all. This line will be a curve; and it will, for some distance from the axis, coincide very nearly with the arc of a circle whose centre is at X', so that the wave-front will travel in the denser medium approximately as if it had originally come from X'. The relation between the distances AX, AX', and \( \mu \) is given by the formula

\[
\mu = \frac{AX'}{AX} = \frac{\mu_0}{\mu_1} / AC, \quad \text{where } \mu_0 = \text{the refractive index of the original, and } \mu_1 = \text{the refracting medium.}
\]

For example, let \( \mu_0 = 5 \) (air) and \( \mu_1 = 1.5 \) (crown-glass); AC = 2 inches; AX = 1 inch (i.e. the source of light is one inch to the left of A). Then

\[
\frac{AX'}{AX} = \frac{1}{2}; \quad \text{whence } AX' = 2, \text{ the light travels in the denser medium as if it had come from a point 2 inches to the left of A. If the wave-front be plane as it approaches A, that is equivalent to } AX = \infty \text{ or } \mu_0/AX = 0; \quad \text{whence } AX' = \text{equal to } + 6, \text{ or the light converges on a point in the denser medium 6 inches to the right of A.}
\]

If the plane wave-front approach A in the denser medium, that is equivalent to \( AX = \infty \); but, as the original medium is now the denser one, \( \mu_0 = \frac{1}{2} \) and \( \mu_1 = 1 \); whence, by the formula, \( AX' = -4 \), and the convergence is on a point 4 inches to the left of A. These distances of the points of convergence for plane waves, at

\[
\sin \theta = -4 \quad \text{and} \quad +6
\]

from A, are the Principal Focal Distances for the curved surface and the media in question; and they bear numerically the same ratio to one another as the refractive indices do; from which, together with the previous example, we may infer that the focals for an axial ray, \( AX = 1 \); which shows, still keeping to our numerical example, that when the object lies at a greater distance than 4 inches to the left or 6 inches to the right of A, the image is a real one on the opposite side of A; when it is at a loss distance from A, X and X' are on the same side of A, and the image is virtual. X and X', thus determinable when one of them is known, are conjugate foci; and they are interchangeable, so that an object at either will produce an image, real or virtual as the case may be, at the other.

The refracting medium may not be of indefinite extent, but may be bounded in the path of the light by another surface. If this be symmetrical with respect to the first spherical surface we have a lens; and then, by repeating our calculations of the refraction at the second surface as if the image produced by the first were itself an object, we arrive at the formulæ given in the article on Lenses.

If a parallel beam of light enter one plane surface and be there refracted and emerge by another which is not parallel to the first, we have the essentials of a Prism. Assume the incident light to be monochromatic; then fig. 4 shows the incident beam SP taking the equation, on the figure, of SPQR. The elements of the problem are, \( \mu \) being the relative index of refraction of R the prism: (1) \( \mu \sin QP' = \sin SP' \); (2) \( \sin PFQ' = \sin RQm \); (3) angles \( \sin QP' \); (4) angles SP' + RQm = angles A + m \( \sin \mu \), last being the Deviation produced by the prism. These four equations contain seven terms; and it is sufficient to measure three of these, say the angles A, SP, and m \( \sin \mu \), in order to ascertain the rest, including \( \mu \), the relative refractive index of the prism, for a monochromatic light employed. If, however, the light employed be not monochromatic but mixed, as ordinary daylight, we find that the prism sends each wave-length—each colour-sensation-producing component of the daylight (see Colour)—to a different place, and thus produces a Spectrum (q.v.). Each wave-length has its own \( \mu \) and its own deviation; the more rapid, shorter waves being the more refrangible by a given piece of glass.

If in fig. 4 the prism be turned so that S and R lie symmetrically with reference to the angle A, the deviation is then a minimum; and in that position of minimum deviation a monochromatic beam, divergent from S, will come to focus at R. In examining the spectrum of light from a source S it is necessary to turn the prism so as to ensure the narrowest beam, by producing this minimum deviation for each part of the spectrum in succession. When the deviation is a minimum everything is symmetrical; SP = RQm; QP' = PQ'; whence, by equations above, SP' = \( \frac{1}{2} (A + m \sin \mu) \), and QP'' = \( \frac{1}{2} \); whence \( \sin \theta = \sin \frac{1}{2} (A + m \sin \mu) + \sin \frac{1}{2} \), which determines \( \mu \) when the angle of the prism and m \( \sin \mu \) have been measured. The refractive indices of liquids and of gases are determined by enclosing them in hollow prisms of glass whose walls are made of truly parallel glass; the parallel glass produces no deviation. In liquids the angle of total reflection or critical angle may also be readily measured; then the sine of this angle is \( 1/\mu \). The refractive index varies with changes of density, \( \mu - 1 \) being approximately proportionate to the density; and it bears certain intimate relations with the molecular constitution of the body of the prism.
yellow, while it absorbs the rest. Further, it is found that in these cases of anomalous dispersion the substance generally has in the solid form a surface-colour different from that seen through its solution; and there are always absorption-bands, on the red side of which the refrangibility is increased, while on the other side it is diminished, as if the molecules themselves took up oscillations of particular periods and hurried on the propagation of slightly slower or retarded that of slightly more rapid oscillations of the ether. It appears as if this kind of action were never wholly absent; the spectrum produced by a prism never wholly coincides with the diffraction spectrum in which the deviation for each wave-length depends directly upon the wave-length itself; and the spectrum produced by a prism say of crown-glass does not exactly coincide in its visible distribution of colours with a spectrum of equal length made by a flint-glass prism. This is called the Irrationality of Dispersion. If now we take two prisms, such as C (crown-glass) and F (flint-glass) in fig. 5, and pass a beam of light through; then, if the angles of these prisms be suitable, the rays dispersed by the one will be collected by the other, and there will on the whole be deviation without dispersion; but not absolutely so, on account of the irrationality of dispersion of both prisms, the effect of which is that a calculated ratio of angles and refractive indices which will cause deviation without dispersion for any given pair of wave-lengths will, to a very slight extent in most cases, fail to do so for the other wave-lengths present in the mixed light transmitted through the system. By the use of three prisms three wave-lengths may similarly be abeamatised.

**Double Refraction.**—The wave-surface developed when a disturbance originates at a point in a homogeneous medium, like glass, is spherical in form. In uniaxial crystals (see Crystallography) the disturbance travels with two wave-fronts, one spherical, the other ellipsoidal; and the two wave-fronts are coincident along the direction of the optic axis. Of such crystals some are positive, such as quartz and ice, and in these the sphere encloses the ellipsoid; in negative crystals, such as Iceland spar and tourmaline, the ellipsoid encloses the sphere. If then a beam of light, plane-fronted, extraordinary refracted ray, E. The radius of the smaller circle is to that of the greater as 1:μ; the tangent to this画a circle, as at right angles to XA, cuts SS' in T: tangents TO and TE to the smaller circle and the ellipse are also drawn so as to pass through T; the ray XA is deflected so as to pass through the points at which these tangents touch these curves; and thus there are two refracted rays, as an eye towards O will see two images of the light. The light of the greater refracting power is found to be polarised (see Polarisation) in a plane containing both the incident ray and the crystalline axis: the extraordinary ray E is polarised in a plane at right angles to this. In biaxial crystals the three optical axes are dissimilar, and the wave-surfaces become complex; there are two sets of refracted rays. If a doubly refracting substance be put between two crossed Nicol's prisms (see Polarisation), light passes; and by this means it is found that many substances ordinarily not doubly refracting become so when exposed to unequal stress, as by pressure, heat, or rapid cooling.

**Conical Refraction.**—In certain cases light, passing as a single ray through a plate of a biaxial crystallised body, emerges as a hollow cone of rays; and in others a single ray, falling on the plate, becomes a cone inside the crystal, and emerges as a hollow cylinder of rays. These extraordinary rays were predicted from the wave theory of light by Sir W. R. Hamilton (q.v.), and experimentally realised by Lloyd. See Preston's Theory of Light (1800).

**Refrigerants** are remedies which allay thirst and give a feeling of coolness, although they do not in reality diminish the temperature of the body. The following are the refrigerants in most common use for external or internal administration: water, barley-water, dilute phosphoric or acetic acid, citric and tartaric acids taken in combination with bicarbonate of potash as effervescent draughts, ripe grapes, oranges, lemons (in the form of Lemonade, q.v.), tamarinds, chloride of potash (ten grains dissolved in water, and sweetened with syrup, to be taken every third or fourth hour), and nitrate of potash, which may be taken in the same manner as the chloride, or as nitre-whey, which is prepared by boiling two drachms of nitre in a pint of new milk; the strained milk may be given in frequent doses of two or three ounces.

**Refrigeration.** In refrigerating machines there is a consequent change of heat from the substance which is to be refrigerated to the cooling agent, which is evaporating fluid, expanding gas, or a material which promotes evaporation of the liquid to be cooled. If 80 lb of Centigrade units of heat be withdrawn from a pound of water at 0° C. it will become a pound of ice at the same temperature. If this heat be withdrawn from the water by an evaporating liquid there are two conditions which must be fulfilled; the evaporating liquid must evaporate very rapidly, and the latent heat of evaporation (i.e. the heat absorbed from outside during evaporation) must be as great as possible. Ether boils at 35° 5' C. (95° 9' F.), and has at 0° C. (32° F.) a vapour-pressure of 18 1/4 cm. (7 3/4 inches) of mercury; at 0° C. it requires 94 lb. Centigrade units of heat to evaporate a pound of it; and at that temperature its evaporation ought accordingly to be as rapid as possible. If the heat of evaporation were withdrawn from water, to freeze 94 lb of water at 0° C. it would require 1907 lb. of ether. Alcohol is more advantageous than ether in respect to the heat required, and is ponderiously less so in respect of its lesser volatility. Liquid ammonia boils at -33° C. (-31° F.), and has at 0° C. a vapour-pressure of 318 cm.

For producing the simplest apparatus for producing cold dry air for use in the refrigerating chambers of dead-meat-carrying steamers, the principle is that compressed and cooled air will, when allowed to expand against an external resistance, so that it does mechanical work during expansion, lose heat equivalent to the energy which it has expended. In the former the same air is alternately compressed in one place and expanded against some resistance in another.

Porous jars, used to keep water cool, are amongst the simplest kinds of refrigerating apparatus: the evaporation at the outer surface of the jar of the water passing through the porous earthenware taking latent heat from the water (see EVAPORATION).

For details as to refrigerating machines, consult Bondie's Ice-making Machinery (Spon, New York); Spon's Dictionary of Engineering (Ice-making Machines, p. 996); Spon's English Dictionary (Artificial Ice, p. 1133). See also the articles COLD, FREEZING MIXTURES, ICE; and for the Refrigeration of the earth, see EARTH, TEMPERATURE.

Regcline given to persons who have fled from religious or political persecution in their own country, and taken refuge in another, especially to Flemish refugees during the persecution by Alva in the Low Countries, and to French Protestants who fled to England in or after 1685, with the sanction of the English government. See Huguenots, EXTRADITION, POLITI-

Regalbuto, a town of Sicily, 25 miles WNW. of Catania. Pop. 9610.

Regalia, the ensigns of royalty, including more particularly the apparatus of a coronation. The regalia are described at Vol. III. p. 589. The regalia, strictly so called, of England consist of the crown, the sceptre with the cross, the verge or rod with the crown at its top, the orb, the sword called Curtana, the two sharp swords of justice, spiritual and temporal, the ampulla or receptacle for the coronation oil, the anointing spoon (probably the one now kept in the Tower of London), the armaille or bracelets, the spurs of chivalry, and various royal vestments. All these, with the exception of the vestments, are now exhibited in the Jewel-room in the Tower of London. Their total value is estimated at £3,000,000. See BLOOD (THOMAS); and W. Jones's Crowns and Coronations: History of Regalia in all Countries (1883).

The proper regalia of Scotland consist of the crown, the sceptre, and the sword of state. For the crown, see Vol. III. p. 589. The sceptre is of the time of James IV. The sword was a present from Pope Julius II. to James IV. in 1507. During the Civil War the regalia were removed by the Earl Marischal for safe custody from the Crown-room of Edinburgh Castle, their usual place of deposit, to his castle of Dunnotar (q.v.); and the crown, sword, and sceptre were found as they had been deposited at the Union, along with a silver rod of office, supposed to be that of the Lord High Treasurer. They are now in the charge of the officers of state for Scotland, and are exhibited in the Crown-room. See Sir Walter Scott's Account of the Regalia of Scotland (1810).

Regality, BURGHS OF. See BOROUGH.

Regatta. See YACHT, ROWING.

Regulation. See ICE.

Regeneration is a theological expression denoting the spiritual change which passes on all men in becoming Christians. There are various interpretations of the mode and meaning of this change, but its generic effects of baptism or another may be said to be admitted by all branches of the Christian church. By all man is supposed, as the condition of his becoming truly Christian, to pass from a state of nature to a state of regeneration, from a state in which he obeys the mere impulses of the natural life to a state in which a new and higher—a divine—life has been awakened in him. The words of our Lord to Nicodemus: ‘Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God,’ are accepted as the expression of this universal necessity by the Catholic church. It may be truly stated that every branch of the Christian church recognises, although under very different conditions, the Holy Spirit as the author of this change. The change in its real character is spiritual, and spiritually induced. According to a large portion of the Christian church, however, the change is to some extent involved in the rite of baptism. In the Catholic view baptism constitutes always a real point of transition from the natural to the spiritual life. The grace of baptism is the grace of regeneration; and amongst the most important effects of baptism is the remission of all sin, original and actual; (2) the remission of the penalties due for sin both temporal and eternal; (3) the bestowment of sanctifying grace
and the infused virtues; (4) the imprinting of an infallible 'character' on the soul; besides (5) making the recipient a member of Christ and the church, and qualifying to receive the other sacraments. The moment at which baptism is explained at BAPTISM, and see also GORHAM. Protestants hold for the most part that regeneration is a special, conscious process which takes place independently of baptism or of any other outward fact or ceremony. It implies a sensible experience—an awaken whereupon coming to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life. Technically, Conversion (q.v.) is the action upon man, Regeneration the agency of God.

Regenerator Furnace. See GLASS.

Regensburg. See RATIBSON.

Regent, one who exercises the power without having the name of a king. In a hereditary monarchy there are various circumstances which may necessitate the delegation of the sovereign power—as the devolution of the crown on a minor too young to be entrusted with the kingly office; the incapacity of the sovereign by illness, mental or moral weakness; absence of the sovereign from the realm. A regent under the title of Protestant (q.v.) has often been appointed to exercise royal authority in the sovereign's minority, the latest instance in England being during the minority of Edward VI.; and regents and councils of regency have been sometimes named by the sovereign to provide for the probable nominal of his heir. During the frequent absences of the first two kings of the House of Hanover in their continental dominions, it was the practice to appoint regents or Lords Justices (see Vol. VI., p. 379) to exercise the powers of sovereignty. In 1788, when George III. became incapacitated from exercising the kingly office by insanity, it became a question whether his eldest son, then of full age, had a right to be regent, or whether the nomination rested with parliament. The chief political authorities of the time were divided in their judgment as to the Prince of Wales, but the king, at the end of the discussion. On the return of the madness all parties were unanimous that the regency should be conferred on the Prince of Wales, and this was done by parliament. In 1830 a Regency Bill was passed, providing for the administration of the government, should the crown descend to the Princess Victoria before she attained eighteen years of age; and in 1840, one providing that the Prince Consort should be regent in the event of the demise of the Queen, her next lineal successor being under age. For university regents, see article UNIVERSITIES.

Reggio (anc. Rhetium Julia), a seaport of South Italy, stands on the Strait of Messina, 9 miles SE. of the Strait in Sicily. It is the seat of an archbishop, and has a fine cathedral. Manufac-
tures of silks, scented waters, gloves, stockings, and caps—the last three made from the baysas of the Pinna (q.v.)—the cultivation of fruits, wine, and olives, and fishing are carried on. Pop. 22,525. The ancient Rhhetium was founded by Greeks in the 4th century. It was taken and destroyed by Dionysius of Syracten (387 B.C.), the Romans (270), Alaric (410 A.D.), Totila (549), the Saracens (918), and captured by Robert Guiscard (1081). Pedro of Aragon (1292), and the Garibaldins (1860). In 1783 it was ruined by an earthquake. The province has an area of 2,221 sq. m. and a pop. of 207,328.

Reggio, a city of Central Italy, stands on the ancient Via Emilia, 17 miles by rail SE. of Parma, and is still surrounded with walls. It has a good cathedral of the 15th century, one of the finest theatres in Italy, a model lunatic asylum, a natural history and an antiquarian museum, a library, &c. Pop. 18,634, who manufacture silk, hemp, linen, cherries, figs, and carry on considerable trade, especially in timber. Reggio is the birthplace of Ariosto. During the latter middle ages it was an independent city, but was subject to the D'Estes from 1409 onwards. The bishopric was founded in 450.

Regian Majestatem, a collection of ancient laws being to have been published by order of David L., king of Scotland. The authenticity of the work has been controverted, the prevalent opinion being that it is a compilation from Glanville's Tractatus. Some authorities attribute the collecting of it to a commission of Edward L., others to an unknown author after the war of independence (14th century).

Regicides, the men who were appointed on the parliamentary committee to try King Charles L., but in a narrower sense the men, sixty-seven in number, who actually sat in trial upon him. Of these only fifty-nine signed the death-warrant. After the revolution the committee were brought to trial on a charge of high-treason. Twenty were condemned to death, but only ten were executed, nineteen, together with six others who were not tried, being imprisoned, most of them for life. More than twenty who were already dead were tried and condemned to die the same, and Cromwell, Ireton, and Bradshaw, three of them, were exhumed and hanged at Tyburn, and then reburied at the foot of the scaffold. For regicides in a wider use of the term, see ASSASSINATION, and E. Regis Les Regicides dans l'Histoire et dans le Present (1850).

Regillus, Lake, lies in Latium, to the south-east of Rome, probably near the modern Frascati; it is celebrated in the semi-legendary history of Rome as the scene (496 B.C.) of a great battle between the Romans and the Latins, fighting on behalf of the banished Tarquin, in which the latter were entirely defeated.

Regiment, in modern armies, is a tactical unit, divided into four battalions (q.v.). One regiment, the cavalry, some six or seven Batteries (q.v.) of artillery, or three or four Battalions (q.v.) of infantry— the engineers and other troops being similarly grouped. In the British army the cavalry regiment consists of eight troops (four squadrons) having a war establishment of 650 of all ranks (22 being officers) and 614 horses. It is a tactical unit commanded by a lieutenant-colonel, with adjutant, quartermaster, paymaster, medical officer, veterinary surgeon, transport officer, band, and artificers.

As regards the infantry the regiment is not a tactical unit. The name is often still given to single battalions owing to the fact that previous to 1881 it was used indiscriminately for infantry corps whether they consisted of two battalions, as did the first twenty in the Army List, or of four, as did the 60th. But in that year 133 battalions of the line were reorganised to form 67 regiments, which should each consist of two battalions of line infantry, two or more battalions of militia, and whatever volunteer battalions there might be in the territory allotted to each regiment for recruiting purposes and called its Regimental district. The Cameron Highlanders (the old 39th) were an exception with one battalion. It had been proposed to link them as a third battalion to the Scots Guards; but this arrangement was not carried out, and in 1897 a second battalion was specially raised to complete the regiment. At the same time the Guards retained their old organisation viz. three battalions of Grenadiers, two of Coldstreams, and
two of Scots Guards—and the 60th Rifles and Rifle Regiment. each of four battalions, are allotted to the regimental district at Winchester. The two Westminster (of three grenadier battalions) have been formed into a regiment of two battalions. The regiments of the native armies of India, no militia or volunteer battalions are attached to it. A territorial regiment is therefore a purely administrative unit, and has no war establishment. It is a regiment for police duty, composed, assisted by an adjutant and quartermaster, and its depot companies, two for each line battalion, train recruits for the service companies.

The Royal Regiment of Artillery is also a purely administrative organisation, including all the horse, field, and mountain batteries and garrison companies of the regular army. The corps of Royal Engineers similarly comprises all the officers and men of that arm. Militia and volunteers are attached to each, and they are each represented at the War Office by a deputy adjutant-general.

The word regiment began to be applied to bodies of British troops in Elizabeth's reign; regiments are spoken of at the time of the Armada, 1588, and as composing the force in Ireland, 1598. From that time forward the army and militia of Britain have been organised into regiments and districts, and the parliament each raised regiments, all of which were disbanded at the Restoration, with the exception of the Lord-general's Regiment of Foot and his Life Guard of Horse. These two were re-engaged (1661) and form the present Coldstream Guards and Grenadier Guards. In the first year a Scotch corps of 1700 men, which had taken service in France in the time of James L., returned to England, and was included in the British army as the 1st Foot. See ARMY, Vol. I. p. 433. In 1660 was formed the troop of Horse Grenadier Guards, and the 2d troop in 1702. These were re-formed in 1782 as the 1st and 21 Life Guards.

Regimental officers are those who are actually doing duty with a regiment, battalion, battery, or company as combatants, in contradistinction to those who may be on the staff or otherwise employed.

Regimental badges, mottoes, and devices are detailed in the Queen's Regulations, and emblazoned, with the battles and campaigns in which either of the battalions of the regiment has been engaged, on the shoulder-straps for appointment.

Regimental pets are animals which accompany the troops on all occasions and have a recognised place on parade. Many infantry battalions have them—e.g. the Royal Welsh Fusiliers always have a white goat, which since the year 1844 has been regularly presented to them by the Queen.

For Regimental Schools, see ARMY, Vol. I. p. 439.

Regimental district (formerly brigade depot) is the territory allotted to each infantry regiment of the British army. The localisation of the forces followed naturally on the adoption of a short service system. The increased number of recruits annually required necessitated the spreading of recruiting agencies over the country, and the desirability of obtaining men from a district to which they would afterwards return as reservists was a regimental system. The 1773 has been modified in many ways, and may be briefly summarised as follows: For the purposes of command, the United Kingdom is divided into 14 districts—ten for England, one for Scotland, and three for Ireland (the Channel Islands command does not share in the localisation scheme), under general officers. Each of these districts has a floating body of regular troops, and is subdivided (with the exception of the Thames, Woolwich, and Aldershot districts) into a certain number of regimental districts, 60 altogether.

To each of these regimental districts are assigned, normally: (a) Two line battalions—if possible one at home and one abroad (see, however, REGIMENT); (b) regiments of artillery and line battalions) have; (c) the militia and volunteer battalions of the district, as well as the infantry of the army reserve. The linked battalions of the line together with the militia battalions form a territorial regiment—to which the volunteer battalions are attached. If possible a territorial regiment draws its recruits from its own district, and the promotion of officers of the line takes place in the regiment and not in a particular battalion. Militia or volunteer recruits are trained at the depot, and every effort made to maintain the connection between the line and the militia. Each regimental district is in charge of a lieutenant-colonel, who superintends the recruiting of the district, and commands the auxiliary and reserve forces in it. His staff comprises an adjutant, quartermaster, paymaster, medical officer, and the usual non-commissioned officers.

Regina, capital of the Canadian province of Assiniboia and seat of government of the North-west Territories, 357 miles by rail W. of Winnipeg. The chief buildings are the lieutenant-governor's residence and the headquarters of the mounted police. Pop. 2000.

Regiomontanus, a German mathematician and astronomer whose name was Johann Müller, was born at Königsberg in Franconia, 6th June 1456. From his birthplace he called himself in the mediæval fashion Johannes de Montegroce; since 1544 Regiomontanus is the name by which he has been known. He was a disciple of George Purbach (1423–61), studying under him at Vienna and elsewhere. In 1461 he accompanied Cardinal Bessarion to Italy in order to learn Greek. He sojourned in Rome, Ferrara, Padua, and Venice; returned for a time to Vienna, and was called by Matthias Corvinus to his court at Buda; but in 1471 he settled in Nuremberg, where a learned and wealthy citizen, Bernhard Walther, subsidised him so as to enable him to construct mathematical and astronomical instruments and to write the fundamental works of his life. The two were associated so closely that the correspondence of the 'Alphonso Tables,' and jointly published Ephemerides 1475–1506 (1473), of which Columbus and other early navigators made much use. Regiomontanus not only worked at astronomy, but restored the study of algebra in Germany and encouraged the science of trigonometry, and published treatises on water-works, burning-mirrors, weights and measures, &c. He was summoned to Rome by Pope Sixtus IV. to assist in reforming the calendar, was made Bishop of Ratisbon, but died at Rome, 4th July 1476.

Among his works are De Doctrina Triangularum (1463); De Quadratura Circuli (1463); Calendarium (1473); De Reformacione Calendaris (1484); De Conic Magnitudine (1531); De Triangulis Omnimodi (1535). See Zinger, Regiomontanus, ein gelehrter Vor¬ läufer des Kolumbus (1874).

Registers, PARISH. The place where parish registers now fill was formerly, but only in very small part, supplied by monastic registers, which, however, as a rule registered only deaths of important persons, so as to be able to tell when masses became due. In the last century there were naturalizations of the families of founders, benefactors, and the like. Entries were also sometimes made in the missals of parish churches, and the monastic chronicles often contain necrologies, whilst mortuary rolls were regularly sent round from monastery to monastery.
These were in effect the sole early public registers, but private necrologies were sometimes kept by the chaplains of great families, e.g. Friz Blackham, who left one of the Paston Halls and Mrs. Upton's and Burn's (History of Parish Registers) mentions several entered in the flyleaves of private books of devotion. But it is mainly to the monastic cartularies and to inquisitions post-mortem and proofs of age that we must go for information on births and deaths of the pre-Reformation period. It is probable that the injunction of Thomas Cromwell in 1538, ordering parish registers to be kept under the system now in vogue, was intended, like Edward VI's scholastic regulations, to meet one of the immediate difficulties connected with the suppression of the monasteries. Had this injunction been strictly acted on we should now be in possession of complete registers from that date onwards. But, perhaps owing to the fall, soon after, of the author of the injunction or to the general laxity of the incumbents, very little heed was taken of it, and the evil which this neglect entailed became so crying that Elizabeth in 1557 issued a stringent order that not only should the registers be better kept, but copies of them should be yearly sent to the bishop of the diocese, an order which was published in 1582 with an enjoining the preservation, arrangement, and indexing alphabetically of the names on the registers. But nothing has been of much value against the ineradicable neglect of the incumbents and bishops. Early transcripts are practically non-existent, and even those of the 18th century are most imperfect. In the returns of the population abstracts in 1801 it was discovered that amongst 11,000 parishes in England 812 registers dating from 1558 alone existed, and later returns in 1854 showed that even that small number had decreased by the negligence of the clergy in the interval. These last returns give full details as to the date of the commencement of each register in England. The only hope in the future for the preservation of the remnant lies in the instant removal from the parish churches (or, as is too often the case, the incumbent's library) of the actual registers and of the transcripts from the bishops' registers to the Public Record Office or to some kindred institution, otherwise further loss must be expected in spite of the fact that many of the clergy are at last waking up to their duty in this respect, and having the registers preserved in their registers, while some have been printed by the Harleian Society and by private individuals.

A full list of the printed registers was issued in 1891 by Dr. G. W. Marshall. Other standard works on the subject are Pigot's Observations on Parish Registers (1764) and Burn's History of Parish Registers (1829; 2d ed. 1862), while brochures on the same subject have been printed by Mr. Chester-Waters (1870; new ed. 1887) and Mr. TASWELL-LAUNGMEAD.

From these works the reader may see how the registers often contain much valuable information as to the history of the parish, many incumbents slightly overstepping their strict duty by putting down noticeable and curious incidents which occurred from time to time. The proper fees for searching are one shilling for the first year (which includes the cost of the paper, etc.), and for subsequent years, though some clergymen try to charge them separately) and sixpence every subsequent year. It seems doubtful if the searcher may take general notes, but he may copy one entry per year without being compelled to pay the further fee of 2x. 7d. which is the usual charge for obtaining an abstract of information from the registers. It seems sixpence in every subsequent year. It seems doubtful if the searcher may take general notes, but he may copy one entry per year without being compelled to pay the further fee of 2x. 7d. which is the usual charge for obtaining an abstract of information from the registers.

Registration may be described as an account of certain transactions and legal facts inserted in a book or books of record. The purpose in view is usually to preserve an authentic and exact record of the transactions, to secure for them a means of publicity, or to simplify the methods of proving them. The practice of inscribing a copy of private documents in a public register seems to have been originally introduced by the Emperor Leo in reference to gifts—the object being to enable heirs to ascertain to what extent was liable before deciding whether to accept the inheritance. A system of registration is now employed in many different departments and for very different purposes, in which registration is carried varies very much in different countries; on the whole, however, it is more carefully enforced and more widely applied in continental states than in England or America. In France and Italy, for example, in almost all transactions parties resort to a notary, who draws up the documents relating to the business in hand. Such notarial transactions are to a certain extent public acts, and are presumed to be valid and binding, until they have been impeached and set aside by a separate proceeding instituted for that purpose. The same is true of documents executed in the presence of a notary having any reference to certain subjects—for example, to the creation or transfer of an interest in land—are transcribed by him in a public register, and are become available for general information. In England all judicial decisions and all the proceedings of the higher courts in their various stages are registered; and with registrars attached to the Privity, council, the supreme court, and the county courts, affidavits, pleadings, &c., are filed. Probates of wills and letters of administration, both of which are really judicial proceedings, are registered in the Probate Division in London, or in one of the district registrars, which are situated at various places throughout the country. Land registries, for officially recording the title to, dealings with, and charges on land, are of two classes—viz. registries of title and registries of assurances. The former are authentic and self-explanatory records, behind which one cannot go except in case of fraud. The latter merely contain a statement of the existence of documents or assurances affecting the title, and the index of the document, and leaving the persons concerned to draw their own conclusions as to the effect of these documents on the title to the land. The whole subject of land registration has been much discussed of recent years in England, and several attempts to establish a system of registration have been made without much success. Lord Westbury's Act (25 and 26 Vict. chap. 53), establishing a general land registry for England and Wales, has notoriously proved a failure. The present statute regulating the general registration of land is the Land Transfer Act (38 and 39 Vict. chap. 87), which creates an office of land registry in London; but in the case of this act also practical results have been very small. The doubts and complications surrounding titles to land in England are so appalling that, though a compulsory system of registration is universal in many countries, the British parliament has not dared to enforce it. Bills of sale must be registered within seven days after execution, or, if executed out of England, then within seven days after their arrival in England; further, a bill, if still existing, must be registered within one year—unless the Merchant Shipping Acts every British ship must be registered, as also must all changes of ownership in a ship, whether by sale, mortgage, death, or bankruptcy; in the United
REGISTRATION

Kingdom the principal officer of customs at the port of registry is the register or clerk. After 1828 other principal officers are the registrars of joint-stock companies, established by the Companies Acts; the register of friendly societies; the registers of designs, copyrights, patents, and trade-marks; the registers of seamen, of newspapers, of solicitors, of personal property, &c.

In Scotland registration is an important feature in the administration of the law. It may be treated under two heads viz. registration for preservation and execution, and registration for publication. Registration in order to execution—i.e. to enforce the rights of the party are a coroners reform from the practice of churchmen, who, in order to bring the enforcement of ordinary contracts within their jurisdiction, procured the insertion in obligations of a solemn oath of performance and consent to excommunication in the event of failure. It is now an almost universal practice to insert a clause of registration in deeds stipulating for money payments, especially in bonds. A short clause of registration has been introduced by recent conveyancing acts, in these words: 'And I consent to registration hereof for preservation (or for purposes of law) in the books of the parish clerk, and if any deed or writing whatsoever, is declared to import a consent to registration and a procurator of registration in the Books of Session and the records, or other judge's books competent therein to remain for preservation and also, if for execution, that letters of bonning and all necessary grants to the executor shall pass thereon, upon six days' cliarage, on a decree to be interponed thereto in common form' (31 and 32 Vict. chap. 101, sects. 8, 138). Such registration for execution, which is in effect a short cut to a writ of probate, is a form of administration, must take place after the death of the creditor or of the debtor. By special statutes the privileges of registration in order to diligence are extended to bills and promissory-notes, the acceptance and subscription of which implies a consent to registration for execution. The records now available for registering deeds for preservation or execution are these: (1) The Register of the Great Seal; (2) the Books of Session and Censorship, for all deeds and probative acts; (3) the books of any sherff court; (4) the books of royal burghs, for instruments of probate, wills or testaments; (5) the General Register of Sasines.

Registration for publication applies chiefly to writs connected with heritable rights. The present system owes its origin to the statute 1017, chap. 16, which established a general register in Edinburgh, and particular or local registers throughout the country, in which sasines and other acts affecting heritable property should be registered within sixty days of their date. The instrument of sasine and the whole ceremony of sasine are now dispensed with in the transfer of lands; by the Titles to Land Acts of 1858 and 1860, the recording of the conveyance itself, with warrant of registration thereon, now constitute the only legal effect to the same as if an instrument of sasine had been executed and recorded at the date of recording the conveyance as evidence of the subsequent execution and recording. The registers for publication now subsisting are (1) the General Register of Sasines, divided into counties; (2) Register of Entails; (3) General Register of Inhibitions and Adjudications; (4) the Burgh Registers of Sasines for lands in each royal burgh in which such a register has been in use to be kept; are public registers of Scotland used to be under the charge of the Lord Clerk Register; but the duties of that functionary in this connection were by 42 and 43 Vict. chap. 44, sect. 5, transferred to the Depute-clerk Register. All the records are collected at the General Register House in Edinburgh.

In the United States, in order to be wholly valid, a deed or other instruments affecting the title to real estate must be recorded in the proper office for the registry of deeds, and this constitutes constructive notice of its contents. A chattel mortgage must be filed to be effective against third persons. That is valid between parties without filing. In most of the states the effect of the filing continues only for a limited period, usually for a year, and the mortgageee must consequently refile within the prescribed time. The certificate of the recording office is considered as an authority of the state. A digest of the provisions of the different statutes as to the registration of deeds, see Stimson's American Statute Law, sect. 1601 et seq.

REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES is the name for the system of regulations prevailing for a record of these events in England the first act on the subject dates from 1836. By it a general register-office was provided at Somerset House, London, for England and Wales. But even before the new arrangement there had been in operation an ecclesiastical method of recording baptisms, marriages, and burials in connection with each parish church, it being the duty of the officiating minister to keep such a register. See REGISTERS (Parish). Also, since 1592, the compilation of weekly bills of mortality (q.v.),containing particulars as to the death-rate of London, has gone on almost uninterruptedly. These modes of registration were found to be well-nigh useless for statistical purposes. Hence the systematic plan instituted in 1836, by the Acts 6 and 7 Will. IV. chaps. 55, 56, which have been a model of order and correctness in administration, and are still the basis of the whole being entitled the Births and Deaths Registration Acts, 1836–74; the last and most important is the 37 and 38 Vict. chap. 88. There are special legislative provisions as to the registration of marriages. The acts provided that the head of the system should be the Registrar-general of births, deaths, and marriages in England. An annual abstract of the registrar's returns must be laid before parliament. Every poor-law union throughout the country is subdivided into districts, and in each district a locally-resident registrar is chosen by Superintendents of parishes and are also appointed. The registrars make out their returns quarterly, and send them to the super-intendent-registrar of the district, by whom they are transmitted to the general register-office. There they are preserved, and may be inspected or excepted on payment of a small fee.

Births.—In the case of every child born alive, the father and mother, or, in their default, other specified persons, are to give notice of such birth to the district registrar within forty-two days after the occurrence. If this is not done he may require any of the defaulters, by notice in writing, to attend and inform him, within three months of the birth, with the particulars thereof. Special provisions are made for the case of foundlings, children born at sea, &c. It is the duty of the registrar to maintain the books of births, and keep the entries of births, and register the same within three months free of charge. After three months the birth can only be registered with certain formalities, including payment of a small fee, and after twelve months only with the written consent of the Registrar-general. The particulars to be registered are the place and date, sex of child, its name and that of the mother and the father, with the calling of the latter. The signature and description of informant are also noted. The date of registration and signature of registrar complete the entry.

Marriages.—These may be religious or civil. In
the first case they may be performed according to the rites of the Church of England, of the general body of Nonconformists, of the Society of Friends, or of the Jews. The Registrar-general must send marriage register-books to the minister of every church, and the clergyman must send them to each registering officer in England of the Society of Friends or Quakers, and every secretary of a synagogue in England. In each case, the official to whom the book is sent must register in two of the books in duplicate the particulars of the marriage, the names of the parties, and the time and place of the ceremony; and a quarterly return is also furnished to him. In the case of Nonconformists other than Jews and Quakers, the registrar attends at the registered building, and registers the marriage himself, as he also does when it is a purely civil ceremony taking place at his office. The particulars entered are date of marriage and name, age, condition, calling, residence, father’s name and calling of both parties.

Deaths.—Much of what has been said about registration of births applies to registration of deaths, but the following points are to be noted. Notice must be given within five days of the occurrence by the nearest relative of the deceased present; if he does not, the duty falls on other specified persons. A notice preliminary to registration must be given, and the time expires in fourteen days. In default of action of others, the registrar ought to require the person liable to appear before him within twelve months from the death have elapsed, and supply him with the statutory particulars. After the lapse of twelve months he must be within the authority of the Registrar-general before the entry can be made. There are special provisions for inquest cases, &c. The particulars of registration are date, place, name, sex, age, calling, cause of death, name of certifying medical man, name and description of informant, date of registration, and signature of registrar. Provision is made for sending notice of the death of medical practitioners, &c., to special registrars, in order that their names may be struck off special lists.

All the registers since 1836 and a number of the older ones are preserved in Somerset House. The registrars are bound to keep, on payment of a fee, a search of such recent registers as are in their possession. There are thirty-nine acts on the subject. They are from the 52 Geo. III. chap. 160 to the 50 and 51 Vict. chap. 71. In Ireland, as in England, the law of 1836 is almost exactly the same as in England. There is a Registrar-general and a general registrar-office at Dublin. In the case of Roman Catholic marriages, a registrar’s certificate must be obtained and produced before celebration. The officiating clergyman then fills it up; it is returned to the registrar, who enters the particulars in the proper books. Other religious marriages are registered in the same manner as Church of England marriages are in England. There are fifteen acts dealing with the subject, the first being the 7 & 8 Vict. chap. 81, the last the 43 and 44 Vict. chap. 13.

Although the law in Scotland on this subject is much the same as in the rest of the United Kingdom, some points of difference are to be noted. The general registrar-office is at the Register House, Edinburgh. The offices of registrars are held by the Deputy-clerk Register. Notice of a birth is given in twenty-one days; after three months a declaration must be made before the sheriff by the informant of the particulars proposed to be registered. Provision is made for correction of the register. The case of regular religious marriages is a statutory schedule is produced to and filled up by the officiating minister. It is then sent to the registrar, who enters the necessary particulars in his book. The register is then sent to the registrar of the county, or of the city, as the case may require, to be presented at marriage, and register the same. There is a fixed fee for this is 20s., and he is entitled to the same sum for registration after conviction or decree of declarant of an irregular marriage. There are ten acts dealing with the subject; the first being the 30 & 31 Vict. chap. 10, the last the 48 and 49 Vict. chap. 61, sect. 5. It will be understood that penalties of varying degrees of severity are enacted against breakers of the Registration Acts. See FLAXMAN’s Registration of Births and Deaths in England, Wales, and at Sea (1875).

REGISTRATION OF VOTERS.—It is a condition precedent to the exercise of the right to vote in parliamentary elections that the name of the voter should be upon the register—a preliminary requisite first introduced when the franchise was remodelled in 1832. In England the process of registration, which was settled by the last Registration Act (43 & 44 Vict. chap. 5), is as follows: On the 15th of April in each year a precept, containing a description of the qualifications which entitle persons to be registered as voters, is sent by the clerk of the peace in a county, or by the town-clerk in a borough, to the churchwardens or other persons in whose parish the register is kept. On the 31st of July the overseer must make out a list of occupiers, whom he has ascertained to be qualified—persons who have paid their rates, and who are not disqualified by receipt of pamphlet relief—and a list of lodgers, who have sent in their claims to vote in respect of their lodgings. By the 20th of August all new claims have to be sent in, and the lists, together with notices of objections, have to be published on the door of every church or public chapel in the parish. These lists of occupiers and of claims and objections are then sent by the overseer to the clerk of the peace in a county, and to the town-clerk in a borough. In September the revising barrister comes round and adjudicates upon disputed claims and objections; from his decision an appeal lies on a case stated by him to the Queen’s Bench Division of the High Court. After the revision, the register is completed. If it is for a county, there are three lists—lists of ownership, occupation, and lodger voters; if it is for a borough, there are two lists—the ownership list being omitted in boroughs.
